The rule which the unhappy man had prescribed for himself was as rigid as that of the most self-mortified anchorite. It was more severe, from being practised in the midst of society and business. His rule was not temperance, for he had never been intemperate, but total abstinence from wine. Solitude was not in his power, for he wished to be continually engaged in business; but he resolved never to employ English speech farther than was absolutely needful, nor one superfluous word in any human language. Charles Hepburn left the ship at Bombay. By his conduct he had secured the esteem and goodwill of the captain; and from this circumstance, and the proofs of his superior education and capacity, he obtained an appointment on an indigo plantation, in the Upper Provinces, where he esteemed himself fortunate in having no European associates—no society whatever, save that of the simple natives. After remaining here for two years he had money to transmit, and he ventured to write home; but these letters never reached his wife and his father. The money was never claimed. He now imagined himself strong enough to endure better the temptations of society; and he longed to be rich! Who had motives like his for gaining what an Indian would smile at as but a very paltry competence! The speechless, melancholy man became the supercargo of a private ship trading between Bengal and China. His associates—or those human beings about him—were now chiefly Lascars, for still he shunned European society. Again he had written home, but this time he sent no order for money. All he was worth was embarked in trade on his own account; and his intelligence and energy were agreeably manifested in the success of his speculations. At the end of his third voyage Hepburn hoped he was reformed! He was at least rich enough in his own estimation, for he had in his possession bills on London for £9000; and letters from Agnes and his father had waited him at Madras, beseeching him to come to them—only to come home!—to love—to happiness—to a share of the bread which, by God's blessing on frugal industry, had never yet failed them—which his exertions must increase—his presence sweeten! They had complied with all his proud wishes; never had his name been mentioned by them. It was enough that in their own hearts they knew that he lived and loved them.

About noon on an October Sunday, the Carlisle mail, rolling over the same moor, but at a vastly augmented rate of speed, set down a traveller, on the exact spot, where, ten years before, Charles Hepburn had left his *Greysteel*. The traveller was a handsome, grave-looking man, between thirty and forty, embrowned by the burning suns of a hot climate, and of the appearance, which, for want of a more accurate definition, is usually called military. He carried a very small portmanteau; and, as the coach drove off, proceeded on foot up the stony path, merely a bridle-way, which led winding into the hills from the wide open moor. Frequently he paused—looked round the country,

or to his watch, and to the sun, which was still high. In one of these halts, he was overtaken by a young shepherd, with his dog, but in his Sunday clothes, for he was returning, as he told, from the Seceder meeting-house, which stood far off on the verge of the moor. In such circumstances, conversation was inevitable. An intelligent Scottish shepherd is not, by very many degrees, less curious than a Yankee farmer.

"An' ye have been in the Indies!—'Od, it maun be a queer country the Indies. Was't the place where they have the breed o' sheep Robin Steele tells about, with tails sae braid that ilk ane maun have a whirlbarrow to carry the tail o't after it. Ye'll have seen Sir Pulteney and young Craighdarroch, I reckon! It's a desperate place the Indies for making siller." The stranger said he had seen the gentlemen alluded to; and added, "And Robin Steele is alive still!"

"Howt ay.—Sae ye kenned Robin? Alive! what should ail him!—a doure, steive auld deevil, who ran wi' the souplest o' us at the last games."

"And as great a Whig as ever!" said the stranger, smiling.

"Worse," said the man, laughing to see Robin's character so well understood; "a clean Glasgow Radical. It might cost auld Fernylees his tuck, if the Dyeuke or the Factor were to hear the half O'Robin's nonsense—ay, and sense too, which they like far waur." The stranger held his hat before his face, while his companion eyed him keenly.

"And Robin is still at the Fernylees!"

"Ye may be sure o' that, and him in the body. How could the place do without Robin, or Robin without the place! All the three years the auld Maister lived in the village, Robin hung on about the farm; and so was there before him, to welcome him and his gude-dochter, when they went back."

"His whom?" inquired the stranger, eagerly.

"His gude-dochter—that's what the English call his daughter-in-law:—ye'll no understand our Scottish tongue. And a good dochter has she been to him—English and stranger to our country though she be. Yea, in truth, what Ruth the Moabitess was to ancient Naomi, and—better to him than ten sons. Mrs. Charles is, to be sure, an angel upon the yearth—sent to make up to that worthy patriarch o' the Fernylees i' the end of his day for the crossing and cumber he has had with his family, and fight with world's gear.—I'm jalousing ye have aynce kenned something o' the Fernylees folk!"

The stranger bowed in acquiescence.

"Their tale is soon told. Old Fernylees gave up the farm to Mr. Gilbert, and brought home Charles' English wife and her child, just after that good-hearted, harumscarum, ne'er-do-weel, ran off from her and his bairn to gude kens whither-and-beyont. Tibby Elliott (if ye kenned the lave, ye would ken Tibby, for she was aye the tongue o' the trump in the house of Fernylees) grugged at first a fremit woman, with a young wean, coming home to be a burden on the auld Maister's sma' means; but He who brings good out of ill, made the sight o' that young English lady even the greatest blessing ever fell on the auld Maister's gray head. With her white genty hands she wrought wi' her needle and her shears, late and early, for him and her bairn; keeping a bit school for the farmers' dochters here about: and wi' her kindness and her counsel she stayed

and comforted him in all his afflictions. The hale country-side blessed her; and when, in the hinder-end of the ither year, the plea about her tocher, carried on by the great Mr. Dennistoun, the Liverpool merchant, out of his own pocket—lose or win—for her behoof and her bairn's, was fairly won—conscience! ye would have thought it was the auld Dyeuke's birth-day come back, when rents were reasonable, and nae Radicals in the country-side. There was as good as five thousand pounds o' it—very convenient it came to buy back the stocking of the Fernylees, when Mr. Gilbert, seeing every year growing worse than the last in this rack-rent country, would be off to Van Dieman's Land, before the Dyeuke had gotten his last plack. Robin Steele will no let on what the new rent is; but if mercats bide up, there's bread to be made out o' the Fernylees yet, he says, if there were younger een to look after it. Yet it is just wonderful how the auld Maister, in his blindness, goes about the knowes, led by his grandson; but he has kenned the braes all his days."

"My father! My father!" exclaimed the stranger, surprised and shocked by the information of his father's blindness; and the voluble young shepherd, considerably abashed, now knew in whose presence he stood. Where his now quiet companion's road struck off, Charles shook hands, and parted from him almost in silence.

Charles suffered the shades of night to fall deep before he found courage to leave the hazel copse and approach the house, and peer over the window-curtain into the little green walled parlor, where, in the blaze of the turf-fire, sat all that was dearest to him, the faces that had haunted him, asleep or awake, in the jungle, on the deck, or at the desk! On one side of the fire, in his old place, sat his silver-haired blind father; on the opposite seat, his Agnes; and leaning on the old man's knee, with a book—yes, that was his boy! He was now prattling to the grandsire, who spoke and smiled to Agnes; and as she returned his speech and smile, he drew his hand caressingly over the child's head, as if complying with some fond request. Charles could stand no longer. He perceived his friend Tibby, unchanged in looks, dress, or bearing, spreading the cloth on the small table, from which she had just removed the Bible, probably after family worship, and he drew into the shade of the porch as she passed him to go to the outer kitchen, and smiled internally, yet not without a slight pang, as he heard her say, "Na, Robin, ye'll see we are just going to have another spoiled bairn—the auld game o' the young *Chevalier* ower again. There's the auld Maister consenting that the little rogue shall sit up this night, to the SABBATH NIGHT'S SUPPER: but, to be sure, there's a reason for it; for the bairn repeated the fifth Command in the distinct way it would have done your heart good to hear. I maun make him a pancake."

In ten minutes afterwards the boy spoken of, panting and rosy, came flying into the kitchen, crying, "Robin, Robin shepherd! there's a grand gentleman sitting under Judon's ash, just where my grandpa' says his prayers: come and see him." They went out hand in hand.

In three minutes Robin was back—his eyes staring, his hair rising. "As I am a living sinner, Tibby Elliott, if Charles Hepburn be in the body, he is sitting under Judon's ash—and I have seen him!"

Tibby turned round, the frying-pan in her hand;

and brandishing it about, burst into the most extraordinary screaming and eldritch laugh her old friend had ever heard, seen, or imagined. Nervous disorders and hysterics were rare at the Fernylees.

"I the body! and what for should he no be i' the body! heich! heich! heich! Eh, airs!" and down dropt the frying-pan; and Tibby raised her hands, wept and sobbed in a manner yet more frightful and *eldritch*. "As ye are a living sinner! and are na ye a living sinner? I could prove it. And what for should not Charlie Hepburn come hame, and appear in the body to his own bairn on the very spot where his godly father has wrestled—heich! heich! heich! heich! —" and she went off into another fit of hideous and wild laughter.

Robin was now almost at his wit's end. It was clear Tibby had lost her senses, so there was no time to lose with her. He had read or heard that cold water was a specific in hysterics, or vapors, or some female ailment or other; and seizing a large *cog*, that stood full on the dresser, he dashed its whole contents about her, leaving her in the middle of the kitchen like a dissolving Niobe.

When Robin went again to *Judon's ash* no one was there!—but through the same pane where Charles Hepburn had lately looked, he saw "the blithest sight had e'er been seen in the Fernylees since the auld maister's bridal." An instinctive feeling of delicacy, which nature often denies to the peer to plant in the bosom of the shepherd-swain, told Robin that this, however, was no sight for him—and he went back to his friend.

"It's just Charlie Hepburn, Tibby lass! come home at last, a wise man and a wealthy. Losh, woman! ye surely canna be angered at me, a feal auld friend! for twa or three draps o' clean cauld water spilt between us, meant a' for your good! Let me help ye off with your dripping duds, and bask ye quick to welcome the Young Chevalier.

If I've done ye offences, I'll make ye amends."

"I freely forgi'e ye, Robin," Tibby sobbed; "freely forgi'e ye—ye meant weel. But this should be a *SABBATH NIGHT'S SUPPER* we ne'er saw the marrow o' in the Ha'House o' the Fernylees. And, save us, man! draw back the broche! Is this a time to scouter the single dyenke, [duck meant this time, not Duke,] when I hae skailt in my joy the dear bairn's pancake. But ye are no caring, dear, deed are ye no!" cried the gracious Tibby, as the boy burst bounding upon them, and clasping Robin's knees, exclaimed, "That gentleman is my papa; I took him from Judon's ash to my mamma. Did you see him, Robin? He's a braw gentleman! I have looked at him all this time. Mamma cried, but my blind papa lifted his hands and said his prayers; and my other papa said to me, 'Run now, my boy, and call my trusty fere, Robin Steele. Let me have all my father's friends about me.'"

The "trusty fere" kept the child for some time; and then they went together to summon Tibby's old *aid*, now a decent shepherd's wife, and mistress of a neighboring bothie.

Seated by the thrice-blest Agnes at the head of his board, the dim eyes of the venerable old man seemed on this night to beam with a heavenly lustre. "Nay, Robin, nay Tibby, ye shall sit by, and among us," he said, as the faithful old servants would on this night have withdrawn;

"ye have shared days of sorrow wi' us, we will share our joy together. Sit ye down, dear friends, while we crave the Almighty's blessing on anither *SABBATH NIGHT'S SUPPER*."

From the Protestant Churchman.

BRIDGES.

I HAVE a bridge within my heart,
Known as the "Bridge of Sighs;"
It stretches from life's sunny part,
To where life's darkness lies.

And when upon this bridge I stand,
To watch life's tide below,
Sad thoughts come through the shadowy land,
And darken all its flow.

Then, as it winds its way along
To sorrow's bitter sea,
Mournful is the spirit-song,
That upward floats to me.

A song which breathes of blessings dead,
Of friends and friendships flown;
Of pleasures gone—their distant tread
Now to an echo grown.

And hearing thus, beleaguering fears
Soon shut the present out,
While bliss but in the past appears,
And in the future doubt.

O, often then will deeper grow
The night which round me lies;
I wish that life had run its flow,
Or never found its rise!

II.

I have a bridge within my heart,
Known as the bridge of faith;
It spans, by a mysterious art,
The streams of life and death.

And when upon this bridge I stand,
To watch the tide below,
Sweet thoughts come from a sunny land,
And brighten all its flow.

Then, as it winds its way along
Toward a distant sea,
O pleasant is the spirit-song,
That upwards floats to me.

A song of blessings never aere,
Of love "beyond compare,"
Of pleasures flowed from troublings here,
To rise serenely there.

And hearing thus, a peace divine
Soon shuts each sorrow out;
And all is hopeful and benign,
Where all was fear and doubt.

O often then will brighter grow
The light which round me lies;
I see from life's beclouded flow,
A crystal stream arise.

A. D. F. R.

From Hood's Magazine.

THOMAS HOOD.

It is with a heavy and an aching heart that we darken these pages, that have so often reflected the brilliant wit of our beloved Editor, and the calmer lustre of his serious thoughts, with the sad tidings of his approaching death; a death long feared by his friends, long even distinctly foreseen, but not till now so rapidly approaching as to preclude all hope. His sufferings, which have lately undergone a terrible increase, have been, throughout, sustained with manly fortitude, and Christian resignation. He is perfectly aware of his condition; and we have no longer any reason, nor any right, to speak ambiguously of a now too certain loss—the loss of a GREAT WRITER: great in the splendor of his copious imagery, in his rare faculty of terse incisive language, in his power and pregnancy of thought, and in his almost Shakspearian versatility of genius; great in the few, but noble works he leaves behind; greater still, perhaps, in those which he will carry unwritten to his early tomb. It is this indeed which principally afflicts him: the *Man* is content to die—he has taken leave of his friends, and forgiven his enemies, (if any such he have,) and “turned his face to the wall;” but the Poet still longs for a short reprieve, still watches to snatch one last hour for his art; and will perhaps even yet, once more, floating towards the deep waters of eternity, pour out his soul in song.

In any case, this, the last number of his Magazine that he may live to see, shall not go forth without *some* impress of the Master's hand—some parting rays of the Flame now flickering low in the socket. We have chosen for this purpose the beautiful conclusion of his “Ode to Melancholy,” which those who know it will delight to read again, while for others it may help to solve the enigma of his many-sided genius, to account for the under-current of humor that often tinctured his gravest productions, and to justify the latent touch of sadness that was apt to mingle in his most sportive sallies. Truly, indeed, for the Poet's earnest heart,

“All things are touch'd with Melancholy,
Born of the secret soul's mistrust,
To feel her fair ethereal wings
Weigh'd down with vile degraded dust;
Even the bright extremes of joy
Bring on conclusions of disgust,
Like the sweet blossoms of the May,
Whose fragrance ends in must.
Oh give her, then, her tribute just,
Her sighs and tears, and musings holy!
There is no music in the life
That sounds with idiot laughter solely;
There's not a string attun'd to Mirth,
But has its chord in Melancholy.”

Hood's “Ode to Melancholy,” (1827.)

FORT LEAVENWORTH.—Such is the loveliness of this situation, and so enticing is its society, that it allures back all who have once seen it and enjoyed the hospitality and kindness of the officers stationed there. Situated upon the bluff which at this place gradually slopes back from the river, it commands a fine prospect of the surrounding country, sprinkled over with trees and diversified by hill and dale—being at once a place of great strength and beauty. The landing is one of the best on the river, Nature having erected a stone wall the whole distance of the front, against which

the turbid waters of the Missouri beat; but it is a wharf which will last for ages, and require no repair. The parade ground is a beautiful spot, surrounded on three sides by officers' and companies' quarters, and on the other, by stables capable of containing horses for six complete companies of dragoons. At this time there are six companies stationed at the fort, four of dragoons and two of infantry, none of which, however, are full. Once in every two months the troops are reviewed and drilled, and a few hours which we spent at the fort, the other day, happened to be upon one of these occasions; and a finer looking set of officers and men we never expect to see.

Fort Leavenworth has long been regarded as an important military post; and now that it is proposed to create a new territory on the other side of the river, it acquires additional importance, as, in that event, it will no doubt be the seat of government, at least for a long time. It is convenient and accessible from all points on the frontier, and must, from its centrality, before long have the superintendency of Indian affairs. It is also the best point for emigrants to start from to Oregon, as by doing so they can keep between the waters of the Kansas, on the one hand, and the Nemeha and tributaries of the Missouri, on the other. Indeed, nothing now prevents emigration from this point but prohibition, and we have heard that this will be removed.—*Weston Journal*.

LIEBIG WHEN A BOY.—Liebig was distinguished at school as “booby,” the only talent then cultivated in German schools being verbal memory. On one occasion, being sneeringly asked by the master what he proposed to become, since he was so bad a scholar, and answering that he would be a chemist, the whole school burst into a laugh of derision. Not long ago, Liebig saw his old schoolmaster, who feelingly lamented his own former blindness. The only boy in the same school who ever disputed with Liebig the station of “booby” was one who never could learn his lesson by heart, but was continually composing music, and writing it down by stealth in school. This same individual Liebig lately found at Vienna, distinguished as a composer, and conductor of the Imperial Opera-House. I think his name is Reuling. It is to be hoped that a more rational system of school instruction is now gaining ground. Can anything be more absurd or detestable than a system which made Walter Scott and Justus Liebig “boobies” at school, and so effectually concealed their natural talents, that, for example, Liebig was often lectured before the whole school on his being sure to cause misery and broken hearts to his parents, while he was all the time conscious, as the above anecdote proves, of the possession of talents similar in kind to those he has since displayed!—*Dr. Gregory on the Head and Character of Liebig, in the Phrenological Journal*.

PROVING AN ALIBI.—A clergyman at Cambridge preached a sermon which one of his auditors commended. “Yes,” said a gentleman to whom it was mentioned, “it was a good sermon, but he stole it.” This was told to the preacher. He resented it, and called on the gentleman to retract what he had said. “I am not,” replied the aggressor, “very apt to retract my words, but in this instance I will. I said you had stolen the sermon: I find I was wrong; for on returning home, and referring to the book whence I thought it was taken, I found it there.”—*Critic*.

ALGÆ, OR SEA-WEEDS.

[This little paper is abridged from the *Inverness Courier* newspaper. It is interesting as a fair specimen of the compositions of the numerous reflecting and observant men scattered over our country in the capacity of land-agents; and we have no doubt that its thoughtful reference to nature at large will, with most of our readers, be sufficient to excuse the local application of some of its details.]—*Chambers' Journal*.

We have a great and growing antipathy at the term *weed*, and cannot help coming to the belief that Dr. Johnson was not following his own nose when he defined weed as an herb "noxious or useless," as we apprehend such an anomaly as a weed in the sense entertained by the doctor, has no place in nature. The doctor, if he had exercised his own judgment in the matter, would, we are convinced, have come to a different conclusion, and would, or at least should, have defined it as "an herb, the use of which is not yet understood." With all due deference to the great lexicographer, and as the term is probably too firmly fixed in our language ever to be eradicated, we would define weed as an agent for gathering, arranging, and storing up matter below the reach of, and intangible to, animal and the higher grades of vegetable life; thus fulfilling a great and mighty end in the scheme of creation—the gathering together of the stray substances which, amid nature's varied manufactures, has as it were slipped through her fingers, and would have run to waste, and converting them, by sure and certain processes, into tangible and useful compounds.

In the article of the algæ, or sea-weeds, we are particularly struck with the economy of nature in so singularly adapting the means to the end. The office of these plants is to collect the stray substances held in solution by the salt water, particularly the alkalies and phosphates; and as these have to be extracted from the water, and not from the earth beneath it, the plants have no roots, properly speaking, but simply processes for clinging to the hard and flinty rocks, as points of attachment; while, at the same time, in place of a firm and erect stem to keep the branches and leaves expanded, as in terrestrial plants, and which would be cumbersome and unhandy for plants which change their medium as often and as regularly as the tides, they are furnished with innumerable air-bags or vessels for accomplishing this purpose, so that the branches and leaves of the plant may come in contact with the greatest possible quantity of water consistent with its size—these air-vessels serving the double purpose of furthering the plant in its destined office, and when this is accomplished, floating it to our shores and beaches to be applied to useful purposes.

In sailing or steaming round our west and northern coasts in the months of April and May, one is struck with the number of boats and men, and horses and carts, and women and boys, and creels, all busily employed at ebb tide in cutting and carrying away sea-weed from the shores, for the purpose of manuring the fields; and when we think of the immense quantities of potatoes raised almost exclusively by this manure, and the number of people who live upon them not only in the country, but in the towns to which they are exported, we must come to the conclusion that the algæ, or sea-weeds, are a tribe of plants of vast importance to a large section of the population of

Scotland at least; and, when taken in conjunction with the peaty and waste soils round our coasts, almost invaluable, as no species of manure reduces a rough peaty soil so quickly to a state fit for the production of human food. There is no need of waiting for the "meliorating effects of the atmosphere," where there is plenty of sea-weed. The lotter, with sea-weed at command, commences his spring labor at the middle of April, and by the middle of May, if the weather be propitious, will have planted potatoes sufficient to serve a numerous family all the year round; and that on the most forbidding peaty soils, never before touched by the spade of man, and of the value, in its natural state, of some three half-pence or twopence per Scotch acre. This is always done on what is called the lazy-bed system, which, in spite of the name, is perhaps the best system for "bringing in" all rough, deep, peaty soils, as the lotter can always calculate on a crop the first season by this mode—an immense affair to a person whose capital or stock in trade consists merely of his "thews and sinews."

If we may judge from the scramble there is for sea-ware all over the thickly-peopled parts of our sea-coasts in March, April, and May, there is evidently a very great demand and want of sea-ware for agricultural purposes; as, besides the great breadths annually cut from the shores at spring tides, hundreds of boats and men are yearly employed dragging it from the bottom with grappling irons—and a most laborious and tedious operation it is—to eke out the scanty supply, and which supply will become yearly more scanty as population increases and waste lands are being taken in. With these views, I need not say that I believe an increase of the sea-ware round our coasts would be a very great blessing and advantage, and would form a permanent source of subsistence to thousands yet unborn; and I am gratified to say that this can be accomplished to a very great extent in a great many situations, and at an expense not likely to prove a barrier in this age of overflowing capital. It is well known that sea-weed prevails most on our rocky coasts; and the reason of this simply is, that the weed requires a point of attachment—something tangible and steadfast to hold by—that it may spread its branches and leaves to catch the stray matter held in solution by the water. With this point of attachment, nothing further is required to constitute a perennial field of algæ; nature does all the rest. And hence there need be no dread of greedy and slothful tenants over-cropping the land, dissipating the phosphates, and allowing the drains to choke up, and forgetting to pay the per centage on the capital you had invested in them. This is a bargain you are making with nature, and she never repudiates. Here, for once, that wise old saw of that wise old cock, Franklin—namely, that always taking out of the meal tub, and never putting in, soon runs to the bottom—is rendered null. There is nothing but cut and come again with the sea-weed: it is, in fact, a modern exemplification of the widow's cruise and the barrel of meal on a gigantic scale. In walking along the sea-coast at ebb tide, we see that, wherever a beetling cliff projects into the sea, and, as a consequence, the shattered rocks that tumble down from time to time are strewn along the beach, here it is that the sea-weeds are most luxuriant. Now, what nature does in this case we can do artificially, and that to our advantage, as, from the laws that gov-

ern falling bodies, the beach must have a certain inclination before the shattered rocks can roll into, and remain in, the zone where the algae naturally grow. Now, the inclination required to be so great where stones roll in by their own gravity, that the breadth of this zone is consequently greatly narrowed, and instead of having a breadth of sea-weed—as we may have artificially—of a half, or even a whole mile, we have frequently only a few yards.

All that is necessary to constitute a field of sea-weed, is to strew the shore under high-water mark with rough boulders from the nearest cliff; and in order that the shores may be regularly planted, the stones should be regularly laid down at the rate of about one in every yard square. This "planting" of the shores is not at all a new thing, but has been practised on a small scale in various parts of the Highlands, and, in every instance that I have heard of, with the very best success. I lately visited a small patch that had been thus artificially done, some twenty or twenty-five years since, and was quite pleased with the result, as it looked better than any natural piece of sea-ware within miles of it. The piece consisted of about one-third of a Scotch acre, and was done by a small lotter in liquidation of arrears of rent. He, the lotter, I believe, still enjoys the sea-ware of this piece, which he and a neighbor of his assured me could be easily disposed of at 24s. every two years, or, 12s. yearly, being at the rate of 36s. yearly per Scotch acre. I could not so easily ascertain the expense the job had actually cost, as your genuine Celt has an innate caution about him in all matters relative to pounds, shillings, and pence, and has as much dread of breaking through or establishing any precedent that may hereafter infringe his interests, as any lawyer who ever sat at the Queen's Bench. I, however, understood that the job had been the "dernier resort" of the landlord, and probably cost twice as much as it would have done, under ordinary circumstances.

In looking at the job, I had no doubt that it could have been done in the present day at about £8 or £10 per Scotch acre. Supposing, then, the value of an acre of sea-weed at 30s., and the expense of creating it £10, the investment would be something about a seven years' purchase—no bad "spec," one should think, in the present state of the money market; and in *stock* as permanent as the earth itself.

In carrying out improvements of this kind, little engineering skill is required. The only thing to be considered is the nature of the rock or stone to be laid down; and, contrary to what one would expect, land stones are greatly superior to stones taken from either salt or fresh water, and in all cases give, and continue to give, a much superior crop. The reason of this seems simply to be, the smoothness of the surface of rolled or water-worn stones not permitting the seeds of the plant, in the first instance, to form a lodgment; and, in the second place, being too smooth for the fibrous attaching apparatus of the plant to keep a permanent hold of. In regard to the size of the stones, little nicety is required; large stones will do equally as well as small; but it is evident they will be much more expensive in first laying down. Stones of from twenty to forty pounds would be a very handy size, and such as carry a close covering of lichens, and break with a rough granular fracture, will probably answer best. When too small, they are apt to be carried out to sea, or cast

upon the beach when under a fall crop of buoyant sea-weed. The convenience and accessibility of the situation will naturally influence the planter; as also the risk of the new-laid stones being lifted or sanded up; but this is easily guarded against. When we look at the miles and miles on end of barren gravel and sand on some of our sea-coasts, without one vestige of vegetation, and our eye at last rests on some rocky corner abounding in marine vegetable life, we are struck with the difference, but merely imagine that this corner, somehow or other, is favorable to the growth of sea-weed. We do not advert to the fact, that the sea is imbued with the same qualities and influences on the barren and gravelly beach as in the rocky and weedy corner; nevertheless it is the same. The rent and shattered rocks precipitated into the sea from the cliffs above is the work of nature in her incessant career of building up and pulling down. This operation we can happily imitate, to the extent at least of strewing our shores with the fragments of our mountains; while nature at the same time "bears a hand," and clothes these fragments with perpetual verdure.

From the Forget-Me-Not.

THE PROPHET IN THE WILDERNESS.

LINES ON AN ENGRAVING BY MARTIN.

WHEN, from before the threatening queen,
Far for his life the prophet fled,
He durst not seek the fields of green,
But straightway to the desert sped.

There, 'neath the juniper, he came
To make its favoring shade his rest,
For languor bent his aged frame,
And heavier woe his heart oppressed.

Losing his trust that weary day,
He lifts the murmuring voice on high;
"Now take, O Lord, my life away!
It is enough—now let me die!"

As thus he lay amid the waste,
His faithful God beheld him there;
And, pitying, bade his angel haste
His grief to soothe, his meal prepare.

Then rose the seer His name to bless,
Who for the houseless wanderer spread
A table in the wilderness,
And there with strengthening waters fed.

SONNET ON THE DEATH OF LAMAN BLANCHARD.

GENTLE and kind of heart—of spirit fine;
The "Elia" of our later day—the sage
Who smiled the while he taught, and on the page
'Mid wisdom's gold bade gems of wit to shine;
He hath departed, and the tuneful Nine
Mourn a true worshipper; his lyric strain,
His moral song, for these we list in vain;
The sparkling essay, pure in its design,
And full of racy humor, we no more
With each recurring month shall read, and still
Improve the fancy and instruct the will
With images and thoughts from that rich store,
That mental treasury—that copious rill,
That freshened and gave life to all it gushed o'er.

H. G. A.

From Chambers' Journal.

BOOKSELLING BEFORE THE INVENTION OF THE PRESS.

It has long been acknowledged that the book-selling business, from its very nature, requires a greater amount of intelligence to be successfully carried on than any other branch of trade. Authors—who must be considered good judges of the matter—have, as a body, testified in favor of this view of bookselling; and although disappointed writers occasionally show an aptitude to decry “the trade” and its professors, yet the most eminent authors have seldom joined in such a condemnation. Dr. Johnson speaks of them only too highly, for he designates them “the patrons of literature,” whilst in truth they are only the agents of its real patrons, the public. D’Israeli the elder remarks, that “eminent booksellers, in their constant intercourse with the most enlightened class of the community—that is, the best authors and the best readers—partake of the intelligence around them.” Booksellers are inseparably identified with literary history. Whoever, therefore, takes an interest in that progress of civilization which has been helped on so materially by letters, will find much to instruct and entertain him in tracing back, through the records of past time, the rise and vicissitudes of the book-trade, and by finally looking round on the present condition of things, and following its progress up to the state in which it now exists. With this view we have busied ourselves in collecting various historical notices and anecdotes concerning booksellers and their craft, from the earliest down to the present time.

Before the invention of printing, the articles in which the booksellers dealt were manuscripts. These were inscribed on some flexible material, manufactured either from the inner bark of trees, (hence the Latin word *liber*, and the German *buche* or book,) from the leaves of the papyrus plant, or from leather or parchment. In one of the earliest forms of books, only one side of the material was written on, and one sheet was joined to the end of another till the work, or one section of it, was finished, when it was rolled up on a cylinder, or staff. The leaves composing such books were designated *paginæ*, from which we derive our term “page;” the sticks upon which they were rolled were *cylindri*, at each end of which was a knob for evolving the scroll. These balls were called *umbilici*, or *cornua*, “horns,” of which they were often made, though sometimes composed of bone, wood, or metal, either elaborately carved, or richly inlaid with gold, silver, or precious stones; the edges of the scroll were called *frontes*. On the outside of each scroll was written its title.* In the earlier manuscripts, the writing was not divided into words, but joined in continuous lines. The Greeks read from right to left, and from left to right alternately, the reader commencing the one line immediately under the termination of the line above. This was a highly necessary arrangement for the guidance of the reader, who, by adopting the modern plan, would have been very apt to “lose his place” on account of the extreme length of the lines: for those ancient volumes were much larger than we at the

present day have any notion of.* The scroll, when rolled up, was often a yard and a half long, and the lines of manuscript consequently very little short of that, across. When extended, each volume was sometimes fifty yards long. A roll of calico, such as is seen standing at linen drapers' shop windows, will give the reader some idea of the external form of an ancient book, without its umbilicus or roller. Each scroll was usually washed in cedar-oil, or strewn between each wrap with cedar or citron-chips, to prevent it from rotting or being eaten by insects. Ancient books did not exclusively consist of scrolls. The Romans had also books of papyrus, or vellum, folded in square leaves like ours. These they called *codices*.

Such were the articles which formed the stock in trade of a Grecian bookseller. The trader was also the manufacturer, keeping a number of transcribers to make copies of the works he sold. Diogenes Laertius mentions that there were at Athens public bookshops called *Bibliopoleia*; nor were these libraries solely devoted to the copying and selling manuscript books, for it was the custom among the learned to meet in the shops to discuss the literary gossip of the day, to criticise, possibly, a new comedy by Aristophanes, the tragedy of the last feast of Bacchus, or to dispute on the latest philosophic theory. In those times when, from the extreme labor of producing them, books were both dear and scarce, the shopkeeper sometimes hired a qualified person to read a new manuscript to his learned customers, and to give an exposition or lecture concerning it. This must have been an important branch of his business; for, from the high price of books, the sale of copies must have been upon a very limited scale. The works of Plato appear to have had an unusually large circulation, for concerning them history records one of the earliest instances of literary piracy: Hermodorus the Sicilian, a disciple of that philosopher, having turned his attention to book-selling, extended the sale of his master's works not only throughout Greece, but as far as Sicily. This was done, however, without the consent of the author.

When literature, in its onward course, left the shores of Greece and fixed itself for a time at Alexandria, under the fostering encouragement of the Ptolemies, the book-selling business had become of so important a character, that a regular market was established for the sale of manuscripts. “The trade” was chiefly composed of emigrant Greeks, who had by that period acquired a character all over the civilized world for cunning and knavery. Hence we find Strabo bitterly complaining that most of the volumes at the Alexandrian market were “copied only for sale;” in other words, hastily, and without revision or comparison with the originals. He also laments that the impertinence of the transcribers introduced matter which the author never penned. This scanty information is all which exists concerning the book-

* The implements used by a Grecian or Roman scribe were as follow:—“A reed cut like our pens; inks of different colors, but chiefly black; a sponge to cleanse the reed, and to rub out such letters as were written by mistake; a knife for mending the reed; pumice for a similar purpose, or to smooth the parchment; compasses for measuring the distances of the lines; scissors for cutting the paper; a puncher to point out the beginning and end of each line; a rule to draw lines and divide the sheets into columns; a glass containing sand, and another glass filled with water, probably to mix with the ink.”—*Manual of Classical Literature: from the German of J. J. Eschenburg.*

* The ancients seldom numbered the divisions of their works as we do, but named them after some deity or patron. Thus the books of Herodotus respectively bear the names of the muses.

sellers of the old world. When, however, literature forsook the east, and, travelling westward, set up a long rest in Rome, more ample details concerning their mode of doing business are at our disposal.

The first mention of Latin books, as forming regular articles of commerce, is made by several writers who existed during the time of the Roman emperors. It is to be inferred that, previous to that time, people of distinction borrowed works from their authors, and caused copies to be made either by professed scribes, (*librarii*,) or by their own slaves. Gradually, however, the demand for books made it worth while for certain individuals to devote time and capital to their purchase, and these tradesmen were designated, after their Grecian brethren, *bibliopole*. Their shops were in public places: in, for instance, the well-frequented streets near the Forum, the Palladium, the Sigilarii, the Argiletum, and the temple of peace; but principally, according to Gellius, in the Via Sandalinaria. These shops being, as at Athens, much resorted to by men of letters, were the chief sources of literary information; they formed what modern newspapers call an "excellent advertising medium:" announcements of new works were constantly exhibited not only outside the shops, but upon the pillars of the interior. Depôts for the sale of manuscripts were also to be met with in the provincial towns. A mongst the Roman booksellers originated the practice of purchasing copyrights, and it has been clearly ascertained that several of the most celebrated Latin works were the exclusive property of certain *bibliopole*. The names of several of these booksellers have been handed down to posterity, chiefly on account of their excellent mode of doing business, and for the care which they took in insuring the correctness of the manuscripts they sold; frequently going to the additional expense of employing the authors themselves to examine and compare the copies made from their works. The Tonsons, Longmans, Cadells, and Murrays of the times of Horace, Cicero, Martial, and Catullus, (who mention them,) were the "speculative" Tryphon, the "prudent" Atreetus, Tul. Lucensis "the freed man," the brothers Sosius, Q. P. Valerianus Dicus, and Ulpus. We are informed by Galenus that less respectable bookdealers took dishonest advantage of the fair fame of these magnates in the "trade," by forging the imprints of those celebrated publishers upon imperfect and ill-written copies.*

With the fall of the Roman empire the book-selling business not only declined, but was for a time swept away from the list of trades. Literature and science, ingulfed in the monastic system, were hidden in the cloister. The monks became the transcribers of books, and in this laborious occupation the learned Benedictines are known to have particularly excelled. The works produced by these religious men were almost exclusively missals, or books of devotion; copies of the Scriptures were also produced by them, though to a less extent. There was, however, at this period, a great difficulty in procuring material on which to write books, and the device, more ingenious than commendable, was resorted to of deterring the writing of old classics, and then using the cleaned parchment for the works required. This practice is understood to have caused the loss to the world

of several classic authors. Occasionally, in old collections of manuscript books, a missal or copy of the Gospels is to be seen inscribed on vellum, on which shines faintly the not-altogether obliterated work of an ancient writer. We lately saw, in the Bibliothèque Royale, or great public library in Paris, a copy of the Gospels as old as the ninth century, which had thus been written on the cleaned pages of a classic author. Whether on new or old vellum, a great number of books were copied and collected in England during the eighth century; the monks of that period having been exceedingly emulous of attaining skill in writing and illuminating; and at a later period, this was enumerated as one of the accomplishments even of so great a man as St. Dunstan. They abandoned the system of writing on scrolls, adopting the form in which books are now printed. Yet posterity had little benefit from these great assemblages of books; for, during the numerous inroads of the Danes from the ninth to the eleventh century, many of the richest libraries were committed to the flames, along with the monasteries which contained them.* In the thirteenth century, books were, from these destructions, extremely scarce, and the few that existed were exclusively in the hands of the monks; for they were almost the only persons who could read them. "Great authors," says D'Israeli, "occasionally composed a book in Latin, which none but other great authors cared for, and which the people could not read." For these reasons, the small amount of bookselling which took place in the middle ages was solely conducted by monks; and works, being scarce, fetched prices which would astonish the modern bibliomaniac. It is well authenticated that the homilies of Bede, and St. Austin's psalter, were sold in 1174 by the monks of Dorchester (Oxfordshire) to Walter, prior of St. Swithin's, (Winchester,) for twelve measures of barley and a splendid pall, embroidered in silver with historical representations of St. Birinus converting a Saxon king. At a later period, a copy of John of Meun's "Romance of the Rose" was sold before the palace gate at Paris for 40 crowns, or 33*l.* 6*s.* 8*d.* A learned lady, the Countess of Anjou, gave for the homilies of Haimon, bishop of Halberstadt, the unheard-of exchange of two hundred sheep, five quarters of wheat, and the same quantity of rye and millet. Among these instances of the high prices sometimes set on unprinted books, we cannot exclude mention of an extraordinary work, which was executed in a singular manner. It consists of the finest vellum, the text cut out of, instead of inscribed on each leaf, and being interleaved with blue paper, it is as easily read as print. The title involves one of the paradoxes in which authors of that age so much delighted: it is "Liber passionis Domini Nostri Jesu Christi, cum figuris et characteribus nulla materia compositis"—(The book of the passion of our Lord Jesus Christ, with figures and characters composed of nothing.) For this singular curiosity the Emperor Rodolph II. of Germany offered 11,000 ducats. As the book bears the royal arms of this country, it is thought to have been executed by some ingenious and patient English monk. We mention the work to account in some measure for the high prices adverted to, which Robertson, in his history of Charles V., adduces as a proof of the scarcity of manuscripts. The truth is, that some copies were intrinsically valuable for the beauty and rich-

*History of the Book-Trade and the art of Book-Printing. By Frederic Metz. Darmstadt: 1834.

*Biographia Britannica Literaria, pp. 35 and 107.

ness of the binding; and a few others were rendered almost beyond price, from having the relics of saints inserted in them. At a visitation of the treasury of St. Paul's cathedral, in the year 1295, by Ralph de Balduck, (afterwards bishop of London,) there were found twelve copies of the Gospels, all adorned with silver, some with gilding, pearls and gems, and one with eleven relics, which were ingeniously let in to the plates of precious metal that surrounded each page.*

We cannot find that bookselling awoke from its monastic torpor till the establishment of universities in various parts of the continent. But in 1259, sellers of manuscripts, chiefly on theological subjects, became so numerous in Paris, that special regulations were instituted regarding them. Pierre de Blois mentions that they were called librarii or stationarii. The former were brokers or agents for the sale and loan of manuscripts. By stationarii (so called from having stations in various parts of cities and at markets) were meant sellers and copiers of manuscripts, like their Roman prototypes. It appears that at the time the above laws were made, there were in Paris twenty-nine book-sellers and book-brokers, two of whom were females. The enormous prices they demanded for their books became a public scandal, and one object of the new law was to regulate their charges. *Taxatores Librorum*, or book-taxers, were employed to determine the price which every manuscript should be charged, that, on the one hand, the stationarii should have a reasonable profit, and that, on the other, the purchaser should not pay too dear.† But the most profitable branch of the trade appears to have been lending books, which were generally so valuable, that for their safe return security was taken. When Louis XI. borrowed the works of Rhases, the Arabian physician, he not only deposited, by way of pledge, a large quantity of plate, but was obliged to find a nobleman to join him as surety in a deed binding him under a great penalty to restore the book unharmed. Some books were so highly prized, that they were conveyed or pledged as security for loans, as estates are mortgaged. It is recorded that one Geoffrey de St. Lieges deposited the *Speculum Historiale in Consuetudines Parisienses* (Historical Mirror of the Customs of the Parisians) with Gerrard de Montagu, king's advocate, as security for a sum equal to about 10*l*.

From these facts, it would appear that book-selling was in Paris—then the chief seat of learning—a profitable calling between the twelfth and fifteenth centuries. They were not, however, the only members of the trade existing in Europe. Wherever universities were established, book-sellers also resided, especially in Vienna, Palermo, Padua, and Salamanca. Gradually, "the trade" spread itself over less learned places; and by the time printing was invented, both librarii and stationarii exercised their vocations in most of the larger European towns.

Such was the condition of the trade up to the year 1440, when it felt the effects of a revolution which shook far more important professions and institutions to their base. About the year 1430 it was whispered in Mayence that one John Guttenberg had invented a process by which he and an assistant could produce more copies in one day than two hundred and fifty of the most expert pen-

men. The learned were incredulous; but a few years afterwards their doubts were silenced by the appearance of a Bible in Latin—*printed* from metal types. This wonder was effected by a machine which has since done more for the advance of civilization than all the other expedients of ingenious man to save his labor, or to promote his welfare—THE PRESS.

From Chambers' Journal.

MADMOISELLE LENORMAND.

THE French have been accused of incredulity and want of faith in matters of high and weighty import. How far this may be true we are not now about to inquire; but the sum of 500,000 francs, amassed by Mademoiselle Lenormand, the celebrated fortune-teller, testifies strongly to the credulity of the nation in subjects on which a want of faith might justly be defended. And that credulity, strange to say, was manifested at a time when what were called the fetters of ancient superstition were cast aside by a large portion of society. Moreover, in the character of this far-famed prophetess there does not seem to have been any remarkable elevation, or any great display of intellect. A few fortunate coincidences, an unbounded self-confidence, and considerable shrewdness, were the groundwork of her fortunes, and served to call forth, in a singularly striking form, the weakness of many of the most celebrated characters of the last half century; though it must be acknowledged that her own countrymen alone were not the dupes of her imposture.

The father of Mademoiselle Lenormand was of Falaise; but having married a Mademoiselle Guilbert of Alençon, he established himself in the latter city, where the celebrated fortune-teller was born, besides a younger sister, and a brother who entered the military service. M. Lenormand died young, and his widow, who re-married, did not long survive her second nuptials. The second husband also soon consoled himself for his loss, and took another wife; by which event Mademoiselle Lenormand, her brother and sister, became dependent on the care of a father and mother-in-law; who, to be quit of a young family which did not belong to them, placed the daughters in a convent of Benedictine nuns in the town; from whence, when they had learned all that the good sisters could teach, they were removed to that of the Visitation; and so on through all the convents of Alençon in their turn, after which the future prophetess was apprenticed to a milliner. It was in the house of the Benedictines that Mademoiselle commenced her vocation, by predicting that the superior would soon be deprived of her office; for which ill-boding the young lady was subjected to punishment, and underwent a penance; but the event soon justified the prediction. She continued the career she had begun by announcing the name, age, and various other particulars respecting the successor of the deprived abbess. There were at the time many candidates for the office, and the ultimate decision remained in doubt and abeyance. Verifying at length the truth of the oracle, it confirmed the pretensions of the damsel to a supernatural power of revealing the events of futurity. But the town of Alençon was too confined a theatre for her aspiring disposition, and the needle too ignoble an instrument for one who aspired to wield the wand of prophecy. She persuaded her mother-in-law to send her to Paris, where her

* Dogdale's Monasticon, iii., p. 309—324.

† Annals of Parisian Typography. By the Rev. Parr Greaswell London: 1832.

stepfather was then residing; and at fourteen years of age Mademoiselle Lenormand started for the metropolis, with no other worldly possessions than the clothes on her back, and a piece of six francs in her pocket, given to her by her maternal guardian.

Arrived in the great city, her father-in-law obtained for the young adventuress a place in a shop, where she soon gained the good-will of her employers, and *la grosse Normande* became a universal favorite. One of the clerks undertook to instruct her in arithmetic and book-keeping, and gave her some knowledge also of mathematics. Pursuing her studies with great industry, she soon surpassed her instructor, and resolved, after a time, to gain the means of subsistence by her own exertions, and in a manner congenial to her habits and inclinations. To this end she established in the Rue de Tournon a *bureau d'écriture*, which succeeded well, and where she continued to exercise her vocation as a prophetess till the time of her death in 1843. Her success enabled her, after a time, to get her sister married as she desired, and to promote her brother in his military career. It was towards the end of the reign of Louis XVI. that Mademoiselle Lenormand commenced practice. She found the troubles of the times, which unhinged the minds of all around her, and filled them with alarm and anxiety, very propitious to her views. The unfortunate Princess de Lamballe, whose untimely fate she predicted, was one of her frequent visitors; and she possessed a letter from Mirabeau, written from his prison at Vincennes, in which he intreated her to tell him when his captivity would cease. The revolution followed, and applicants for the benefit of her oracular powers increased. Alarmed at the rapid progress of events, and rendered superstitious by their fears, crowds of anxious inquirers flocked to the Rue de Tournon under various disguises, which it required no great shrewdness or talent to discover. It was at this time that two French guards who had joined the crowd in the attack on the Bastille visited the celebrated reader of futurity: to one she predicted a short but glorious military career, and an early death by poison; to the other the baton of a *marechal* of France. The former was afterwards General Hoche, whose untimely fate fulfilled the augury; the other the celebrated Lefebvre. The Comte de Provence, (afterwards Louis XVIII.,) on the night of his flight from Paris, sent to consult the sybil of the Rue de Tournon, "en qualité de voisine," previous to his departure.

During the reign of terror, Mademoiselle Lenormand continued for some time undisturbed in the exercise of her divination, and was visited one evening by three men, who demanded with smiles of evident incredulity to learn their future destiny. On examining their hands attentively, she became greatly agitated, probably knowing the parties she had to deal with; they encouraged her, however, to speak without fear, as they were ready, they said, to hear whatever doom she should pronounce. For some time she remained silent, and continued to examine the cards apparently with great attention, but evidently under considerable excitement; yielding at length to their encouragement, she foretold their destiny, and, tragic as it was, her visitors received the prophecy with shouts of incredulous laughter. "The oracle has failed for once," observed one of them; "if we are destined to destruction, we shall at least fall

at the same time; it cannot be that I should be the first victim, and receive such splendid honors after death, whilst the people shall heap your last moments with every possible insult." "She slanders the citizens, and should answer for it at the tribunal," observed the youngest of the party. "Bah!" replied the third; "the dreams of prophecy are never worth regarding." The death of Marat, one of the inquirers, soon after, confirmed the first part of the prediction; and the completion of the second alone saved the prophetess from destruction, she being incarcerated when Robespierre and St. Just, the other two visitors, met the destiny she had foretold them. How it chanced that the science of Mademoiselle did not guard her against the danger in which she was involved, is nowhere recorded. Occupied, we must suppose, with the destiny of others, she seems to have neglected to read her own, and fell into perils she might otherwise have avoided by examining the lines in her own fair palm, or dealing out the cards for once for her own information and instruction. Yet that she really had faith in her own power of divination, seems to be proved by her conduct with regard to her brother, who, as has been stated, was in the army. Receiving intelligence that he was severely wounded in an engagement, she never ceased seeking, by means of the cards, to know the state of his health; and at length, after having passed a night in various cabalistic researches, she was found in the morning by her attendant bathed in tears, and gave orders for mourning, having ascertained, she said, that her brother was dead; which was soon afterwards confirmed by the arrival of letters.

After the reign of terror, the celebrity of the prophetess continued to increase. Barrère was one of her constant visitors. Madame Tallien seldom allowed a week to pass without availing herself of her supernatural powers. Barras frequently sent for her to the Luxembourg. From the access she had to the leaders of all parties, it required no great skill in divination to predict many of the events which took place at that time. The empire was, however, the season of her richest harvest. Josephine, as is generally known, was a firm believer in auguries and prophetic intimations. The early prediction of her future greatness, and its termination, has been so frequently repeated, without receiving any contradiction, that it is become a fact which no one questions, and would easily account for the firm faith she reposed in the oracles of Mademoiselle Lenormand, to whom she constantly sent to ask, amidst other questions, explanations respecting the dreams of Napoleon; and when the latter projected any new enterprise, the empress never failed to consult the reader of futurity as to its results. The disasters of the Russian campaign, it is said, were clearly predicted by Mademoiselle Lenormand; and it was from her also that Josephine received the first intimations of the divorce which was in contemplation, which premature revelation, unfortunately for the authoress, procured for her an interview with Fouché, who, on her being introduced, inquired, in a tone of railery, if the cards had informed her of the arrest which awaited her? "No," she replied; "I thought I was summoned here for a consultation, and have brought them with me;" at the same time dealing them out upon the table of the minister of police without any apparent embarrassment. Without mentioning the divorce, Fouché began to reproach her

with many of the prophecies she had lately uttered; and which, notwithstanding the kindness she had received from the empress, had been employed to flatter the hopes of the royalists in the Faubourg St. Germain. Mademoiselle Lenormand continued to deal the cards, repeating to herself in an under tone, "The knave of clubs! again the knave of clubs!" Fouché continued his reprimands, and informed her that, however lightly she might be disposed to regard the matter, he was about to send her to prison, where she would probably remain for a considerable time.

"How do you know that?" asked the prophetess. "Here is the knave of clubs again, who will set me free sooner than you expect."

"Ah, the knave of clubs will have the credit of it, will he!"

"Yes, the knave of clubs represents your successor in office—the Duc de Rovigo."

The fall of Napoleon brought fresh credit and honor to Mademoiselle Lenormand. She had foretold the restoration of the Bourbons, and received the rewards of divination. The Emperor Alexander visited and consulted her; and her old patron, Louis XVIII., again availed himself of her science and advice. But it was not the monarchs of Europe alone that gave their support to this singular woman. Prince Talleyrand, with all his incredulity, and with all his knowledge of man, and Madame de Staël, with all her boasted talents and wisdom, both were carried away in the general delusion.

It was during the consulate, when Madame de Staël returned to Paris, after a lengthened absence, that she allowed herself to be persuaded to make a visit to the Rue de Tournon. In the course of conversation, Mademoiselle Lenormand observed, "You are anxious about some event which will probably take place to-morrow, but from which you will receive very little satisfaction." On the succeeding day, Madame de Staël was to have an audience of the first consul, who well knew her pretensions, and was but little disposed to yield to them. Madame, however, flattered herself that the power of her genius, and the charms of her conversation, would overcome the prejudice she was aware he had conceived against her. The lady was received in the midst of a numerous circle, and fully expected to produce a brilliant effect upon Bonaparte, and all who surrounded him. On her being introduced, the consul abruptly asked, "Have you seen *la pie voleuse*, which is so much in fashion?"* Surprised at the unexpected question, Madame de Staël hesitated a moment for a reply. "On dit," he added, "we are soon to have *la pie séditeuse* also." The second observation completed the lady's confusion; and the first consul, not wishing to increase it, turned and entered into conversation with some more favored visitor. After this memorable audience, Madame de Staël called to mind the observation of Mademoiselle Lenormand, and from that time had great confidence in her skill, paying her many subsequent visits.

The residence of the prophetess for forty years was at the extremity of a court, (No. 5, Rue de Tournon,) and over the door was inscribed, "Mademoiselle Lenormand, Libraire." The profession of a prophetess not being recognized by the code, she took a "patente de libraire," to receive

* The Thieving Magpie, a play so called; the same, we presume, as that called in English the Maid and the Magpie.

her visitors and exercise her vocation, without giving offence to the prefect de police or his agents; and, under the title of librarian, her name is inscribed in the royal and national almanac. On ringing at the door of the oracular abode, a servant appeared, and you were introduced into an apartment in which there was nothing extraordinary. So well was the character of Mademoiselle established, that no additional means of imposture were requisite to support it. Some thirty or forty volumes were arranged on shelves against the wall, chiefly consisting of the works of the lady herself—"Les Souvenirs Prophétiques," "La Réponse à Mon. Hoffman, journaliste," "Les Mémoires Historiques," and five or six other works chiefly on cabalistic subjects. Mademoiselle soon made her appearance—a short fat little woman, with a ruddy face, overshadowed by the abundant curls of a flaxen wig, and surmounted by a semi-oriental turban, the rest of her attire being much in the style of a butter-woman.

"What is your pleasure?" she demanded of her visitor.

"Mademoiselle, I come to consult you."

"Well, sit down; what course of inquiries do you wish to make? I have them at all prices; from six, to ten, twenty, or four hundred francs."

"I wish for information to the amount of a louis-d'or."

"Very well; come to this table; sit down, and give me your left hand." Then followed several queries—"What is your age? What is your favorite flower? To what animal have you the greatest repugnance?" During the course of her questions she continued shuffling the cards; and at length presenting them, desired you to cut them with your left hand. She then dealt them out upon the table one by one, at the same time proclaiming your future fate with a volubility that rendered it very difficult to follow up all she said, and as if she were reading with great rapidity from a printed book. In this torrent of words, sometimes quite unintelligible, occasionally occurred something which particularly struck the inquirer, whose character, tastes, and habits, she sometimes described very accurately, probably in part from phrenological observation. Very often she mentioned remarkable circumstances in their past life with great correctness, at the same time predicting future events, which many of her visitors found to be afterwards realized. Of the failures, probably innumerable, nothing was heard. In justice to the lady, it must however be observed, that her natural shrewdness and observation frequently enabled her to give advice which was of considerable advantage to the inquirer.

Mademoiselle Lenormand, notwithstanding the favors she received from the emperor and Josephine, was a steady and devoted adherent to the elder branch of the Bourbons; and, after the revolution of July, retired very much from her usual business, both in consequence of her age, and from the diminution of her visitors; passing much of her time at Alençon, where she purchased lands and houses, and built herself a residence which she called "La petite maison de Socrate." Remembering the little honor a prophet receives in his own country, she refused to exercise her vocation in her native town, saying that she came to Alençon to forget that she was a "devineresse," and only calculated horoscopes at Paris.

How far she believed in her own skill, cannot be exactly ascertained; but from the fact relative to her brother's death, she seems decidedly to have had some faith in the revelations she drew from cards. Another instance is recorded in which she acted from some principle analogous to those from which her conclusions were sometimes drawn. At the time of the first invasion by the allies, Mademoiselle Lenormand had beside her a considerable sum of money, and many articles of value, which she was anxious to intrust to some one in whom she could place confidence. The only person who presented himself at the time was not much known to her, but at the moment there was no one else to whom she chose to address herself. "To what animal," she asked in her usual routine, "have you the most repugnance?" "To rats," was the reply. "It is the sign of a good conscience," she observed. "And to which do you give the preference?" "Oh, I prefer dogs far beyond all others." Mademoiselle, without hesitation, committed the important charge to his care, as one in whom she could place entire confidence.

The prophetess was in person excessively fat and ugly; but her eyes even in age preserved their brightness and vivacity, and the good citizens of Alençon were wont to say, "Que ses yeux flamboyants leur faisaient peur." It was never understood that Mademoiselle Lenormand showed the smallest inclination to marriage, nor was there ever a question on the subject; but she was well known to have a great aversion to young children. Besides a large funded property, and her houses and lands at Alençon, she possessed a very handsome house in the Rue de la Santé at Paris; a chateau at Poisey, eight leagues from the metropolis; and a large collection of very good pictures, principally representing the acts and deeds of members of the house of Bourbon; also a vast collection of very curious notes respecting the events of which she was either a spectatress or an actress, all written in her own hand, which, by the by, is a most cabalistic-looking scrawl. She had also autographic and confidential letters from most of the sovereigns of Europe, and was in fact a remarkable proof of the credulity of the nineteenth century, and of an imposture which, for its long and continued success, has had few rivals in any age of the world.

Of the two children of her sister, which she adopted after their mother's death, the daughter died young, of consumption, and the son is now an officer of rank. On the decease of his aunt during the last year, he inherited all her property.

EXTRAORDINARY SPORTING STATEMENT.—The following anecdote is given on the authority of "An old sportsman," on whose veracity we can rely:—A gamekeeper to a nobleman in an adjoining county, being shooting upon his employer's estate, on the second of September last, flushed a covey of partridges, a brace of which separated from the others and fled in a direct line for a large fish-pond, by the side of which was a foot-road leading to the mansion. The keeper having killed a sufficient supply for the larder, was returning, when one of his dogs made a stand by the side of the pool, and on the keeper's approaching, the brace of strayed birds rose, and attempted to cross

the pool, but the keeper shot one of them, which was immediately taken, while fluttering on the water, by a large pike. This circumstance did not much surprise him, as he well knew the voracious propensities of the fish. But on the morrow, as he was again passing this large sheet of water, the same dog made what is termed a dead set at the edge of it, and kept looking steadily at a few rushes that grew in the water, about two yards from land. Not seeing anything in the water, the keeper was surprised at his dog standing, and tried to send him in, but without effect, when presently he saw a large pike, about four inches beneath the surface, which he shot, when the dog dashed in and brought it to land. In returning home the keeper perceived an unusual fulness in the belly of the fish, and, taking it into the kitchen, requested the cook to cut it open, when, to his great surprise, he found the bird of his yesterday's killing, which sufficiently accounted for his dog standing when he got to leeward of the fish, as no doubt he was setting the bird, which he must have scented from the respiration of the fish.—The above is one of the many wonderful circumstances which frequently occur to the observation of sportsmen.—*Worcester Chronicle.*

CONTINENTAL RAILROADS.

ROYAL NORTH OF SPAIN.—**BAY OF BISCAY TO MADRID.**—This line is to commence at the port of Aviles, and to extend inland as far as Leon. For this purpose one million of capital will be sufficient. Aviles possesses a fine natural harbor, and it is intended to effect a regular steam communication between Aviles and Falmouth, a distance which will be accomplished in two days. The effect to be produced on the civilization of Spain, by bringing London within three days' journey of Madrid, it is not easy to over-estimate. Within eight miles of Aviles are the Ferrones collieries; a little further on are those of Santo Firme, and for nearly forty miles the line crosses the great Asturian coal-field, the largest in Europe. The anticipated dividend is 14 per cent., the lease is for 99 years, and it is important to our own manufactures to know that all the material for constructing and working the line is to be introduced from Great Britain free of duty.—*Railway Chronicle.*

A line from Lisbon to Badajoz is to be formed and completed in ten years.

BELGIAN RAILWAYS.—*Brussels, March 12.*—We learn that Mr. Stephenson, the celebrated English engineer, has accepted the proposal, made by Richards and Co., to visit the line *entre Sambre et Meuse* in all its details, to study the situation of the country, and consider the wants of the various branches of manufactures, and the modifications in the proposed line which may appear to be advantageous.

GREAT PARIS AND LYONS.—Proposes to connect the north and the south of France, and, by a branch from Dijon to Mulhausen, to connect Marseilles with Strasbourg and the Mediterranean with the Rhine, so as to secure to France the continuance of the commercial transit of which Austria and Italy seek to deprive her.

The formation of companies for foreign railroads proceeds at a rapid pace, and it is said that the Dutch are coming into our market for funds to construct a new line.

From Jerrold's Magazine.

THE HISTORY OF ST. GILES AND ST. JAMES.

CHAPTER VII

As it is our hope, in the course of this small history, to chronicle many great achievements of our hero of the gutter, St. Giles, we shall not follow him year by year through his humble yet industrious course, in which, to his own satisfaction and strengthening conceit, he became profoundly knowing; subtly learned in every way of petty speculation; whether he plundered the orange-baskets of Covent Garden market, or whether, with finest skill, he twitched the tempting handkerchief from the pocket of the lounge. Nor was this, his lowly career, undignified by suffering. No; for ere he was twelve years old, he had tasted the hospitality of Bridewell; where, in truth, he had been inducted into the knowledge of far deeper mysteries than he had ever hoped to learn. In Bridewell, his young and ardent soul had expanded with the thoughts of future fame, won by highway pistol—or burglar's jemmy. And there, too, would he listen to fairy tales of coining; would dream of easy, lasting wealth, acquired by copper guineas. As for the lash bestowed upon him, the pain of that did but burn into his mind his high resolves. He would the more fiercely revenge the suffering upon everybody called honest. He would steal with all his heart and all his soul; he was born and bred to steal; he came into the world to do it, and he would notably fulfil his mission. Such was the strengthened belief of young St. Giles, when, at fourteen and for the second time, he came back to the world across the threshold of Bridewell. Such was his creed: the only creed his world had taught him. Nevertheless, our hero did not vaunt this belief, save among those of his own Newgate persuasion; on the contrary, he assumed the character of a tradesman, that under his commercial aspect he might the more securely plunder the innocents who dealt with him. True it is, he had not the security of a shop; he could not, like his patron the dealer in marine stores, despoil across a counter; but he carried a basket: and whilst to the unsuspecting eye, he seemed only the Arcadian vender of chickweed, groundsel, and turf for singing-birds—for the caged minstrels of the poor—he was, in every thought, a robber.

It was a fine morning early in spring, and Plumtree-street resounded with the sharp tradesman cry of young St. Giles. Pausing at a door-step, and looking up to the second-floor windows, he pitched his commercial note with a peculiar significance, as though giving notice of his whereabouts to an expected customer. "Chickweed for singing birds," cried St. Giles, in a shrill, prolonged voice, as though he would send the glad tidings up to the garret casement, where hopped and fluttered some solitary linnnet—some lonely goldfinch—that, feeling the breath of spring, albeit through prison bars, sang a song of hope and cheerfulness. "Chickweed for singing-birds," cried St. Giles, with increasing volume and impatience. Then again he looked up at the window, and then muttered, "The old un can't be dead, can she?" As he thus speculated, the window was raised, and a woman looked down into the street. "Is it you, my poor boy?" she cried; "stop a minute;" and instantly disappeared. "Thought the old un could n't be dead," said St. Giles, self-communing; and then he began to hum a tune and shuffle

a dancing-step upon the pavement. The door was opened by a girl, who, with no very cordial looks, muttered—"Mrs. Simmer—well, she's a droll cretur, she is!—Mrs. Simmer says you're to come up. You can leave your basket here, can't you?"

"In course, my beauty," said St. Giles, "'cause, you see, there's only these two bunches left; and them I can carry in my hand without breaking my back." With this, St. Giles, rapidly placing his basket against the wall, gave a saucy wink to the servant, and bounded like a kid up stairs. In a moment he was with his patroness, Mrs. Simmer.

"My poor child, I thought you was lost," said the dame in the kindest voice. "What makes you so late?"

"Why, do you know mum, I can't tell what's come to the chickweed: it does n't grow no how, now. If I was n't at five in the morning in Hampstead fields, a hunting in every edge, and hav'n't got above three penn'orth. Chickweed, mum, as Tom Blast says, seems a perishin' from the face of the earth, and only to spite poor people as lives by it. I don't know how much I could n't ha' sold this mornin'; but I says to myself—no, there's Mrs. Simmer's blessed little linnnet, and her darlin' goldfinch as draws his own water—they sha'n't go without, whoever does."

"Poor dear child! good little boy," said Mrs. Simmer, looking with softened looks upon the wily little trader.

"And to hear how all the birds did seem to call to me from their cages—I'm blessed if they did n't, mum, as I came along—but no, says I to 'em, it's no use, my little cockies, no use to be gammonin' me—this here chickweed's for Mrs. Simmer's Bob and Tit, and for nobody else whateomever." And after this fashion was the simplicity of two-score and ten talked to and duped by precocious fourteen.

But dear Mrs. Simmer seemed to be one of those good, old people, who strangely enough carry their hearts in their heads. She had not been above a fortnight in London at the time of this interview with St. Giles, whom she had met in the street, and whose pathetic tale of destitution—delivered with the cunning of an actor—had carried away her sympathies. St. Giles, however, had another claim upon her. He was, she said, such a pretty boy. Dear soul! she could no more read a human face than she could read Sanscrit. She only saw the bright, glittering eyes of St. Giles, and not the fox that looked from them; she praised his eyes and face, as she might have praised a handsome hieroglyph, wholly unconscious of its subtle meaning. A great master has said, "there is something in true beauty that vulgar souls cannot admire." And sure we are, there is something in the truest rascality, that simple benevolent souls cannot detect. They have not an eye for the worst counterfeit countenance; have no ear for a false voice, let it ring ever so brassily. Now, dear Mrs. Simmer was one of these: hence, was she, at fifty, but a babe, an innocent, in the hands of young St. Giles.

"Now, my poor child," she said, "take some tea. I've kept it for you, with some toast;" and Mrs. Simmer took a smoking jug and a plate piled with toast from either hob, and placed them on the table, before her guest. "Take as much as you can, my child, and then you shall tell me all your story as you promised. Poor lamb! Bless you, eat—it does my heart good to see

you;" and Mrs. Simmer, folding her hands, looked with almost maternal tenderness upon St. Giles, who, acknowledging the welcome with a knowing nod of the head, proceeded vigorously with his meal. Mrs. Simmer thought she never saw so handsome a creature: what St. Giles thought of Mrs. Simmer, we will not say. "And so you've no father nor mother, my dear boy?" after some time asked Mrs. Simmer.

"Not one on 'em," answered St. Giles, rapidly moving his buttered chin. "Not one on 'em."

"The Lord help you!" cried Mrs. Simmer: "and no uncle, no aunt, no"—

"No nothing, mum," said St. Giles; and he gulped his tea. "All on 'em died, mum, when I was a babby."

"Poor dear child! Bless my heart! And how have you been brought up?"

"Brought up, mum"—and St. Giles grinned and scratched his head—"you said brought up, mum! Don't know, mum."

"And where do you live, now, my poor boy?" and Mrs. Simmer melted with every question.

"Don't live nowhere, reg'lar, mum. Poor boys, like me, why we live—as Tom Blast says—like the rats, where we can. Then o'nights, mum, I sometimes sleeps in the market among the baskets. Sometimes, though, don't they come with a stick, and cut us out! I believe you!" and St. Giles seemed to speak with a lively recollection of such incidents. "Cuts the werry breath out o' you," he then significantly added.

"Cruel creatures! Gracious little lamb! And I'm afraid you meet with bad boys there, eh? Wicked boys, that may some day tempt you to do something wrong! Eh?" asked simple Mrs. Simmer.

"Believe you," said St. Giles, with well-acted gravity. "Lots on 'em wanted me to go picking pockets—"

"Heaven forbid!" cried Mrs. Simmer, and the tears came to her eyes.

"That's what I said, mum; no, says I, no, I shall stick to chickweed if I starves for it—I'm not a-going to be hanged to please nobody: no, mum."

"That such a precious flower should be thrown away!" cried Mrs. Simmer to herself: and then to St. Giles: "you're a good boy; I'm sure you're a good boy. And tell me; I hope you go to church?"

"Oh, I should like it so!" cried St. Giles: "but you see, mum, it's impossible."

"How so, my boy?" asked Mrs. Simmer.

"Look here, mum," and St. Giles, with the coolness of a philosopher, drew his feet up almost level with the table, and with his forefinger pointed to his ten muddy toes, that showed themselves through the parted shoe-leather. "Parson would n't have 'em, by no means. I did once try to go to church; I did begin to feel so wicked. Well, mum, if the beadle did n't come up, mum, and nearly cut me in two, mum."

"How wicked—how barbarous!" said the ingenuous Mrs. Simmer.

"And only for my bad shoes, and the oles in my coat; but that's how they serves poor boys, mum. I don't think it's kind, mum; do you, mum?" And St. Giles tried to look at once injured and innocent.

Mrs. Simmer wiped her eyes, making an effort to be calm. She then said, "I've been thinking, if I could get you a place in a gentleman's house."

"Would n't that be prime!" cried St. Giles: and as he spoke, there rang through the house a loud and hurried knock at the street-door. Mrs. Simmer, without a word, jumped to her feet, and ran to the window.

"Well, I declare! if it is n't that blessed child! if it is n't his lordship!" she cried.

Young St. Giles, at the word lordship, slid from his chair, and looked slyly about him. Was it possible that a lord could be coming into that room? Could he imagine such a thing, as to see a real lord in such a place? Ere St. Giles had done wondering, the room-door was flung open, and in ran young St. James. St. Giles seemed to shrink into himself at the splendid appearance of the new comer. He wore a bright scarlet coat, thickly ornamented with gold buttons; and a black beaver hat, with a large, heavy feather of the same color, brought out in strong contrast his flushed and happy face. For the moment, young St. Giles felt himself overpowered, abashed by the magnificent outside of the little stranger. He sidled into a corner of the room, and looked at that scarlet coat as though it had been something dropped from the heavens. "Well, nurse," cried St. James, with a loud, ringing laugh, "I told you I'd come and see you, and here I am. I went out riding with Mr. Folder. Well, he stopt to talk to somebody, and so I just gave him the slip, put Jessy into such a gallop! and was here in a minute. I say, can't that boy?"—and St. James pointed his riding-whip towards St. Giles—"can't that boy hold Jessy, instead of the girl?"

"To be sure, my lord—to be sure," cried Mrs. Simmer.

"Certainly, my lord—directly, my lord—I knows how to hold osses, my lord," said St. Giles in a flutter.

"Just walk, her up and down a little, will you, for she's hot," said St. James, with an early knowledge of horse-flesh.

"Yes, my lord—to be sure, my lord—walk her up and down, my lord;" and St. Giles flew down the stairs, and relieved the girl of her charge. Young St. James was then left to have his gossip with Mrs. Simmer: from which gossip a stranger might have learned that the good woman had, for years, been in the service of the family of St. James; that she had been the favorite nurse of his young lordship; and that for the first time in her life she had come to London from the country, where, made comfortable by a pension granted to her by the marchioness, after a short sojourn in the metropolis, it was her purpose to return. She had been to the house in the square, where young St. James had made his chivalrous promise to visit her; yes, at all hazards, to seek Plum-tree street, out of pure love, and a little frolic, to his old nurse. "Oh, I shall be at home now before Mr. Folder," said young St. James, in answer to the fears of Mrs. Simmer, alarmed at the escape of the young gentleman from his tutor. However, we must leave them and descend to the pavement to St. Giles.

With an air of becoming gravity, the boy led the pony up and down before the door, his eyes riveted upon the beast: certainly a creature of extreme beauty. She was jet black, of exquisite delicacy of outline; and her arched neck, quivering nostril, and fiery eye, told something for the spirit and horsemanship of the boy who rode her. Up and down St. Giles walked; and now looking at the animal, now thinking of the boy lord, it appeared

to him that all the treasures of the world were concentrated in that pony—that St. James was a sort of earthly angel; a being of altogether another kind to the boys St. Giles had ordinarily met with. There was something so magnificent about the pony and its rider—that only to have had his lordship speak to him—that only to hold the bridle of his steed, seemed in the confused brain of St. Giles to redeem him from somewhat of his misery and lowliness. He could not but think the better of himself for all time to come. He had spoken to a lord—had held his horse! Could any of his gutter companions boast such greatness? These thoughts were busying the mind of St. Giles, when he heard himself addressed by a familiar voice. "What! my flower?" was the greeting; and St. Giles, turning, beheld his friend and tutor, Tom Blast. St. Giles, in his last retirement to Bridewell, had had the advantage of Tom's tuition; and to speak truly, the teacher and pupil were worthy of each other. Tom was a scoundrel of most extensive experience; and had the happy art of so simplifying his knowledge, that he made it available to the meanest understanding. St. Giles, however, had no need of any such condescension: he could jump at a meaning—good or bad—half way. Hence, the teacher and the taught respected each other for their mutual excellence. In fact, Tom Blast looked upon young St. Giles, as his Newgate son; and St. Giles, in default of another, considered Tom as the best of fathers.

"What have you got here?" asked Tom, his eye sparkling all over the pony.

"Got a oss to old," said St. Giles with an inquiring look at Tom. Then he added, sinking his voice—"it belongs to a lord: sich a little chap, and yet a lord."

"Well, she's a beauty," said Blast; "make her walk a little faster."

"She is a beauty," cried St. Giles, boldly venturing an opinion, and quickening the animal's pace.

"What a sweet trot!" said Blast, "so light and so free; why she would n't break a egg-shell! would she?"

"I should think not," answered St. Giles, a little flattered that his opinion was solicited.

"Come up!" cried Blast, urging the beast into a quicker pace. "Come along, sweet-lips!"

"Stop, Tom; stop!" said the prudent St. Giles, when he had arrived in Bedford-square. "Blest if we don't turn back, if they won't think we're a-going to steal her; and that would n't do, no how, would it Tom?" asked the boy, and his eye encountered Tom's thoughtful look.

"Why—no," answered Tom with some deliberation. "No; it would n't—turn her round again; and walk her gently, Giles; gently, pretty cretur." And as St. Giles complied, Tom turned too, walking with meditative eye that now glanced at the boy and now at the pony. Ambitious thoughts busied the brain of the small, timid thief, Tom Blast; and he pondered on the means whereby he could reap the profits of a stolen horse, still assuring to himself exemption from the tragic penalty. For many years Tom had from time to time eaten stolen bread; nevertheless, he had lived, as it were, upon the crumbs, the broken morsels of crime. He had never had the courage to dare Tyburn that he might dine, but he satisfied himself with the pickings of petty larceny. No; he never promised to earn for himself either biogra-

phy or portrait in the Newgate Calendar. Hence, he was a little perplexed at the temptation that would intrude itself upon him as he glanced at Lord St. James' satin-coated pony. Fortune seemed willing to make him a handsome present of horse-flesh, if he had only the valor to accept it. No; he would not be tempted; he had resolved to die a natural death, and therefore he resolutely dismissed the demon that would destroy him. Nevertheless, he thought it possible that policy might achieve what courage failed to attempt. He might accomplish all by a stroke of wit, profiting in security by the danger of another. St. Giles might be made the robber, and Tom Blast, in happiest safety, pocket the proceeds. Thus ruminating, Tom again reached Mrs. Simmer's door.

"Not wanted yet," said St. Giles, looking from the door to the window. "We'll give her another trot, eh?" And at the word the pony was turned towards Bedford-square.

"Gently," said Blast, "gently. Why don't you have a ride upon her? The young lord would n't know nothing of it. And what if he did? He could n't take the ride out of you again. Only not so big, else she's the very picture—yes the very moral of Dick Turpin's Bess," said Blast, looking critically, admiringly, at Jessy. "Get up, and don't be a young fool," he added; and then St. Giles—he hardly knew how it was accomplished—found himself in the saddle. "There, that's something like life, isn't it," said the tempter suddenly, speaking from the whole breadth of the pavement, and every other minute looking cautiously behind him the while he mended his pace, and St. Giles jerked the pony into a trot. "That's something like living for, eh? and I should like to know why you should n't have it just as soon as any little lord whatsomever?"

"Ha! would n't that be prime, Tom?" cried St. Giles, his eyes sparkling, and face glowing. "Would n't it be prime?"

"It's nothing more than what you ought to have; why, you ride as well as if you was born upon her back—give her her head a little more—now down this way," sharply added Blast; and then rapidly turning to the right, he ran on, St. Giles trotting hard after him. Arrived at the east side of Russell-square, Tom suddenly halted. "Now, St. Giles," said he, "are you man enough to make your fortin?"

"I should think so," said Giles, in high spirits with his feat of horsemanship.

"Now listen to a friend, Giles—a friend as never yet deceived you," said Blast with sudden gravity. "Throw away this bit of luck, and you may never get another. Take the pony and sell it." St. Giles stared. "Why not, you fool! you may as well," cried Blast, "you've stole it, you know!"

"Stole it!" cried St. Giles.

"It's all the same; there's nobody as would believe otherwise—so I'll stand your friend, and get you the money for the bargain. Ha! I see—you have n't no pluck in you—not a bit," said the taunting friend.

"Ain't I though! just you see!" cried young St. Giles, determined to do anything.

"Well, then, as you've got yourself in a bit of trouble, I'll stand by you. Now, you listen; just dash as hard as you can through the fields, and then turn to the right—and so round and round, until—you know the way—until you drop

down upon Smithfield. Then make for Long Lane; and then, just afore you get to the Blue Posts, get off and lead the pony up and down, as if you was holding her for somebody—and then in a crack I'm with you. Now, look sly, and your fortin's made. Young Turpin forever! Off with you!" And so saying, the Tyburn monitor slapt the pony smartly with his broad hand, and the mettlesome creature bounded forth, young St. Giles with difficulty keeping the saddle. Away went the pony up the Long Fields and away towards Islington! The words "young Turpin" still rang in the ears of St. Giles, as he cantered along. He felt that he had already done something worthy the exalted name bestowed upon him; and as his blood mounted with the exercise, he imagined future triumphs that would make him glorious. The robbery of the horse was—for the time—altogether forgotten in the increased importance that had fallen upon him. He dreamt not of the punishment attending the theft; he only thought of the hateful of guineas that the stolen property would produce him. And then, as he rode, how petty and contemptible did his former pickings and stealings appear to him! he almost felt ashamed of himself, comparing his past petty larcenies with his last grand achievement. From that moment he had taken leave of boyhood. He had suddenly become a man, by the grace of daring felony. Then—he thought—how should he ever be able to spend the money! Would he not have a scarlet coat with gold lace to it? ay, much finer than the little lord's! And would he not go to the play every night, and have his hot supper afterwards! And would he not flourish money in a hundred ways that should make all his old companions—the little dirty, paltry thieves of Hog Lane—look up to him with devotion and astonishment?

Still young St. Giles ambled along, and still the world seemed changed to him. He was in a waking dream—a rapture of happiness! All things about him bore a brighter hue; all things sounded with a sweeter music; his brain seemed on wings, and his lightened heart danced in his bosom. And—poor wretch—this ecstasy of ignorance arose from evil, from a crime whose fatal effects, certain as death, would follow him. Still the very houses, to his fancy, took a new and pleasant aspect; wherever he looked he saw a new face of happiness—whatever he heard came toned with a new note of harmony. He saw not the blackened stones of Newgate—heard not the freezing accents of the death-dooming judge. Miserable, foolish wretch!

Yet how often do men—in the ripeness of worldly wisdom, imitate the folly, share the ignorance of young St. Giles! Elated by the commission of some profitable wrong, seeming secret, too, as profitable—how often to them does fortune seem to put on a new and shining face, when at the very time she grasps the lash, or drags the bitter bowl that shall revenge the wickedness. For a brief time does successful evil put a new tint of outside beauty upon all the world; and happy knavery rejoices in the cunning that makes the world to him so beautiful. What a plodding, leaden-eyed fool is mere honesty! what an oaf, an ass, compared to him who squares his code of morals by his seeming interest! And then full surely time advances, and the world, that looked so fresh and smiling, is hollow-cheeked and ghastly—its beauty wiped away, even as a harlot's

paint. Successful knavery, dizzied with its luck, sees suddenly delicious scenes—a paradise of worldly joy and life-long rest—then, waking to the truth, beholds around it burning, barren sand. If the mature pilgrims of the world are sometimes so deceived, why not the boy St. Giles?

Still the young, yes, and happy, felon trotted on, until he entered Smithfield. He then walked the pony slowly up Long Lane, and soon as he espied the Blue Posts, faithful to his orders, he dismounted, looking anxiously around him for his friend and instructor, Tom Blast. A quarter of an hour passed, and still he came not. And then, and for the first time, he looked at the stolen goods with lowering eyes, and his heart felt leaden. What was he to do with the pony without Tom? Nobody would buy it of him. And then a deeper and a deeper shadow fell upon all things; and, biting his lips, young St. Giles, with eyes quick as rats', looked about and about him. What an ugly brute the pony seemed to him! Yes; he knew what he would do: he would jump upon the pony—gallop back to Plumtree-street, and swear he had only been for a ride. Anything to be well clear of the pony. With this thought St. Giles had his foot in the stirrup, when he was tapped upon the shoulders by a man plainly and comfortably dressed in a dark-gray suit, wearing a light flaxen wig in tight curls, surmounted by a large beaver hat, scrupulously sleek. He had a broad, fat face, with a continual smile, laid like lacker upon it. And, when he spoke, he spoke very gently and very softly, as with lips of butter.

"My dear little boy," said the stranger, patting St. Giles affectionately on the back, "where have you been so long?"

St. Giles looked—he could not help it—very suspiciously at the stranger; then scratching his head, he observed, "Don't know you, sir."

"I dare say not; how should you, my dear? But you will know me, and for a friend. I've waited for you, these ten minutes."

St. Giles said nothing; nevertheless his thoughts were never more active. He by no means liked the appearance of his new friend: he felt afraid of him. He would fling himself into the saddle, and gallop off. As he determined upon this, the stranger, in the gentlest manner, twitched the bridle from his hand, and gently said, "My little dear, it's all right."

"All right!" cried St. Giles; and somehow he felt that his stolen pony was about to be stolen from him—"what's all right?"

"You came from Plumtree-street." St. Giles winced. "Now you know you did; don't tell a lie, my little dear; for don't you know what comes of little boys who tell lies! I have seen your friend, and paid him; it's all right; but as you're such a nice little boy, here's a guinea for yourself." St. Giles' heart rose somewhat at the guinea. "You're to go into the house, and wait for Mr. Blast." St. Giles' eyes twinkled at the name: of course, as the stranger averred, it must be all right, "Stop, don't change the guinea; here's a shilling too, my little dear. Now, go in—I don't want to be thanked—only let me see you go in, that you may n't come to any harm in the street." St. Giles, taking a last look at the pony, entered the Blue Posts. The stranger and the pony went—who shall say whither?

St. Giles meekly seated himself in a corner of the hostelry, ordering for his refection two penny

worth of ale, and some bread and cheese. And when he had somewhat soled his inward boy, he began to wonder when Tom Blast would come. Hour after hour passed, and still St. Giles remained alone. Again and again he looked at the clock—again and again at the guinea. Never before had he possessed such wealth: and the contemplation of his riches in a great measure abated his anxiety for the arrival of Tom; even though he thought of him as the bearer of other guineas, the purchase-money of the pony. Still, there was the charm, the fascination of ready gold to comfort St. Giles: the glitter of the money held him like the eye of a snake. His only perplexity was how he could best spend it. He was deep in these thoughts when, the room having filled, his attention was awakened and afterwards possessed by a man who, talking very loudly—and with his clenched fist beating the table the while—about what he called the abstract beauty of honesty, gradually hushed all speakers into reverent listeners. The man was about the middle-time of life, drest somewhat like a grazier. He seemed prematurely bald, which questionable defect gave to his head an outside look of wisdom, possibly not warranted by the contents. He had one of those large clear faces, often called open, because probably there is nothing positive in them. He was earnest and voluble in his speech, as though his arguments welled up from his heart, and would out.

"You have said, sir," he cried, "that honesty is the best policy. You have been pleased to call that a golden maxim."

"I have," answered a huge, dull-looking man, in a butcher's coat. "I have," he repeated; sucking his pipe, and winking his small eyes.

"Sir," cried the bald-headed orator, "I call it the maxim of a rogue and a rascal."

"Hallo! Hallo!" cried some, and "Prove it—prove it," shouted others.

"Prove it! Why it's as plain as the door of Newgate. Now, listen, gentlemen, if you please. Honesty is the best policy, that's what I have to tackle. Very well. What is honesty? I ask you that. Why, I suppose, it's not to pick a man's pocket—it's not to steal his purse, or his coat, or his sheep, or his horse!" Young St. Giles turned his eyes from the speaker. "It's not to put off bad money, or to give short measure, or light weight."

"Stick to the pint," cried a man with an apron, apparently a small shopkeeper.

"I am sticking to it," resumed the orator. "Now I tell you again that that maxim is n't the maxim of a good man, but of a rascal: of a fellow that wants to be rewarded for not stealing—for not passing off bad money—for not giving short measure. He says, no says he, I'll be honest, not because I love honesty for itself, but because it's all to my advantage to be honest. Now, I ask you, is n't that the trick, the cunning, of a sly fellow! What does he know about what I beg leave to call honesty in the abstract?"

"Stop, old fellow; not so fast," cried the shopkeeper. "I never heard of that. What is honesty in the abstract?"

"Why it's honesty stript of all flummery and nonsense," was the answer; "in a word, it's honesty stark-naked."

"I see," said the butcher, winking knowingly. "I see: just as the lord mayor—with his robes and his gold chain, and every rag and thread in the world stript off him—would be the abstract of a lord mayor."

"That's it; just it," said the bald-headed man. "Now, I ask, is any man here a friend of the lord mayor's?"

"I am"—"And I"—"And I"—"And I," cried several.

"Very well; now suppose you got nothing by him! Suppose you never got a dinner out of him, or a little favor of any sort—or a bow—or so much as a civil word of him—well, would you be his friends still! I ask you that." There was no reply. "Well, then, the lord mayor's nothing to you in the abstract, and your friendship's not worth a brass farthing. In the same way that the man who follows honesty because it's the best policy, follows it for what is nothing more than a mean and dirty advantage. No, gentlemen. Make honesty *not* the best policy, and then show me the man that loves it. That's my man—that's the true heart, gentlemen. But, to follow honesty because it's the best policy—why, I repeat it, it's nothing more than the calculation of a sneak-up—of a fellow that has n't the courage to be a rogue. No; give me honesty naked as truth; that's the honesty I love best. I don't want to be bribed for being honest! Eh?" and he gazed triumphantly around him.

"I want you," said a man, putting his head in at the door, and looking with strange significance at the speaker.

"God bless me!" cried the orator, and immediately obeyed the summons.

Oh, abstract honesty! bleed for thy worshipper; for in less than three minutes was he handcuffed at the door on a charge of street robbery.

To return to young St. Giles, an attentive though unenlightened listener to the lecturer upon honesty. St. Giles had heard of honesty; had some dim notion of its meaning. It was a something especially made for people who had all things comfortable about them: so much he knew of honesty: but for honesty in the abstract—in that he was as ignorant, ay, as even some of his betters.

The hours passed, and still Tom Blast came not. Evening approached—night shut in—midnight came, and St. Giles, with a heavy heart, though lightened somewhat by his guinea, turned into the street. He could not go home—no; at least, for a time, Hog Lane must be to him a forbidden Paradise. No matter. Had he not a guinea—a whole guinea—to himself! The thought, even in the midnight street, fell like a sunbeam upon him; he sprang from the pavement with a shout, reckless with his wealth. He would make a night of it—yes, he would have all things glorious! And with this hilarious wilfulness, he took to his heels, and was speedily housed for the night within the very shadow of Newgate.

CHAPTER VIII.

For more than a week did St. Giles live upon his guinea. True it is, that for the first day or two he dined and supped in the Apollo of an eastern cook-shop; besides taking his luncheon of fried fish in the Minorities, for the which delicacy, the Hebrews, thereabout dwelling, enjoy a just renown. But these days of Carnival past, St. Giles economized, with a fine knowledge of the resources of the metropolis. Threepence awarded to him the sweets of sleep beneath a roof; and a shilling saw him safely through the day. However, let not the reader imagine that St. Giles—like many a great genius—was made dull and in-

active by the golden reward of his ability—a circumstance to be so often deplored in the case of great authors, great painters, and especially of great philosophers; wherefore, it is questionable, if the world would not really gain more by them if it never rewarded them at all.—St. Giles was by no means one of these. No: he still kept his eyes wide open at the doings of life; still hived in that odd, world-twisted little brain of his, all sorts of knowledge for the future day. He especially employed part of his time, dodging about the haunts of Tom Blast; but, strange to say, that interesting person never showed himself in any of his wonted places of ease and recreation. Again and again did St. Giles travel Long-Lane—again slink and spy into every haunt in the fond and foolish hope of once more meeting with the soft-spoken man who, at the ruinous price of one guinea one shilling, had purchased a pony of incomparable Arab blood. St. Giles, with all his friendship, all his gratitude for Tom, could not but feel that he had been tricked, bamboozled by his tutor: and the nearer and nearer he approached to his last shilling, the more intense was his indignation—the more insatiable his thoughts of revenge. Yes, it was strange; but the poorer St. Giles became, the less tolerant was he of human frailty. And this uncharitableness is only another of the thousand evils to be shunned in poverty. Therefore, reader, if only to cultivate charity, cultivate wealth: virtue blossoms on a golden bough.

It was the ninth day of St. Giles' absence from his maternal home, and the pilgrim of London stood before a house of humble entertainment in Cow Cross. The time was noon; and St. Giles, feeling the last threepence in his pocket—turning them over, one by one—was endeavoring to arbitrate between pudding and bed. If he bought a out of pudding—and through the very window-pane he seemed to nose its odor—he had not wherewithal to buy a lodging. What of that! London had many doorways—hospitable stone-steps—for nothing; and pudding must be paid for. Still he hesitated; when the cook-shop man removed the pudding from the window. This removal immediately decided St. Giles. He rushed into the shop, and laid down his last worldly stake upon the counter. "Threepenn'orth o' puddin', and a good threepenn'orth," said St. Giles. With a look of half-reproof and half-contempt the tradesman silently executed the order; and in a few moments, St. Giles stood upon the king's highway, devouring with great unction his last threepence. Whilst thus genially employed, he heard a far-off voice roaring through the muggy air: his heart beat, and he ate almost to choking, as he listened to these familiar words:—"A most True and Particular Account of the Horrible Circumstance of a Bear that has been Fed upon Five Young Children in a Cellar in Westminster!" It was the voice of Blast; and St. Giles swallowed his pudding, hurriedly used the back of his hand for a napkin, and following the sound of the crier, was in a trice in Peter-street, one of the mob that circled the marvel-monger of Hog-Lane. Nevertheless, though Tom roared with an energy that very strongly declared his own faith in the horror that he sought to vend for only one halfpenny, still his auditors lacked credulity or coppers, for the well-worn enormity. Nobody purchased. Not even a timorous, sympathizing servant-maid advanced through the crowd to make the mystery her own. Tom looked about him with evident disgust at

what he had heard called the advancement of the age; he had heard of the nuisance, and now he beheld it. His standing in the world as a tradesman was fast crumbling from beneath his feet. St. Giles was hurrying up to his old and early friend, when, at a short distance, he beheld his former patron, Capetick the muffin-maker, and Bright Jem. They looked, as he thought, somewhat curiously at his friend Tom, and then seemed to take counsel of one another. Under these circumstances, St. Giles thought that to accost Tom, would be to call unnecessary attention to himself. He therefore remained, shrunk down among the mob that every moment became less and less. What, too, made it most discouraging to Mr. Blast were the scoffs and loud laughter with which certain new-comers would listen to the description of the horror sought to be circulated, and then hurry off. "That cock won't fight now!" cried one—"A little late in the day for that. Get something new," cried another. "Gammon!" shouted a third.

Nevertheless, be of good heart, Tom Blast: take consolation from this. You suffer in great society: you sink in most worshipful companionship. Very reverend, grave, authoritative persons—men of the bench, even of the pulpit—who for centuries sold to their exceeding profit, "Most True and Particular Accounts" of a horrid bear of some sort—whether of royal or feudal privilege—of witchcraft—of popery—of sham rebellion—nay, fifty bears and bugbears, all of horrid, ghastly nature—they, too, in their turns, have outlived the profitable lie. And even in these latter days, when some Tom Blast in higher places—nay, in the highest—sounds his tin horn of bigotry, and would trade upon some bear apocryphal—he is assured in the like sense, although in gentler phrase, that such cock will by no means fight—that the day has passed for so foolish, vain a story—that, finally, his bear is no bear at all, but briefly, yet intensely—gammon. Has not history her catch-pennies, even as the archives of Seven Dials?

Mr. Blast was somewhat of a philosopher. He could have borne the laughter and scoffing of the crowd, if any of them had bought his ware; but his philosophy was not of that transcendental kind to endure outrage, unmitigated by any sort of coin, even the smallest, current in the realm. He therefore, with a *sotto voce* expression of the deepest contempt for his hearers, broke from the crowd, passing on, and then—his legs evidently walking in a passion—turning, he strode still onwards until he entered Cow-Lane. Here, St. Giles, hanging at his skirts, came up with him.

"Well, if it isn't a sight for bad eyes to see you!" said the unabashed Tom. "But don't let's talk in the street." And Tom made for an opposite public-house, one of his customary places of call, unknown to St. Giles. Stalking through the passage, followed by his young friend, he made his way into a small, dark, low room. "I thought there'd be nobody here," said Tom; and then in a tone of great tenderness and anxiety, looking straight in the eyes of St. Giles, he asked, "Well, and *where* have you been? They're mad about you in the Lane. Where *have* you been?"

"Why, I've been looking for you," said St. Giles moodily, shaking his head. "You must have know'd that."

"And that's I suppose why we did n't happen to meet," replied Tom; possibly recollecting that

his chief care had been to keep out of the boy's way. "Why, what's the matter? you look plaguy sarcy! What are you looking so black at, you young devil?" cried Tom, with sudden ferocity; but St. Giles felt his injuries, and was not to be browbeaten.

"Why, I'm a looking at you—and not much to look at neither," shouted St. Giles, with answering vigor. "You're not a goin' to frighten me, I can tell you. Why did 'nt you come as you promised you would? You're a good un, you are."

"Now, what does ail the boy?" said Tom coaxingly; though evidently ill at ease: for his fingers worked; and he bit his lip as he gazed on the boy, who with sullen, defying air, returned his look.

"Why, this ails me. Did n't you tell me to take that pony to Long Lane—and then did n't you tell me to wait for you?"

"I know it, Giles; I know it; but you see, as I went along, I thought agin over the matter. I thought, you see, it might lead you into trouble, if I came; so I thought I'd stay away, and you'd bring the pony home agin, and then, mayhap, after a little breeze, there'd be an end of the matter. That's it, Giles," said cautious Mr. Blast.

"Then why did you send the man as gave me a guinea, and took the pony away? and, as said too, that he'd made it all right with you, and that?"

Here St. Giles was interrupted in his volubility by Mr. Blast; who performed—and an admirable performance it was—a look of immense astonishment, at the same time whistling very vehemently. At length, mastering his wonder, he cried—

"Why, Giles! you've never sold the pony?"

"No. I never sold it—but you did; the gem-man told me so. You sold it; and after that—"

Mr. Blast could scarcely contain himself, so big, so swelling was his compassion for the injured boy.

"Oh, Giles," he cried—"poor little fellow! You're done, Giles; you're done."

"And who's done me? Why, you have," screamed the youngster in a paroxysm of passion. All childhood vanished from his face, so suddenly was it convulsed with rage. He stood, for a moment, breathless with emotion; and forgetful in his fury of the bulk and strength of his former teacher, he clenched his little fist, and grinding his teeth, advanced towards Blast, who, for a moment, recoiled from the small assailant. Then recovering himself, he laid his hands upon his knees, and with an effort to be calm, contemptuous, said—"And this, you little varmint, is your thanks to me; to me, you scorpion, as has been better than a father to you! To me, who's taught you ballad-chanting, and everything as is decent, you know; to me, as has laid awake in my bed thinkin' what I could do for you in the mornin'; to me, who's always looked on you as a rasher of my own flesh! And you'll shake them little mawleys at me!" The picture of ingratitude was almost too much for Mr. Blast. He was nearly melted in his own tenderness.

"None o' that: that won't do for me, no how," cried St. Giles. "You made me steal the pony—you sold it, and now—"

The charge was too much for the indignant virtue of Mr. Blast. With an exclamation of disgust, he aimed a blow at his accuser, that but for his agility, would have laid him senseless on the floor. Bobbing his head and doubling himself up with wonderful elasticity, St. Giles escaped

the meditated punishment, and the next moment saw him fastened on Tom: clapping him round the waist, and kicking with all his might and malice at his benefactor's shins. Tom, mad with pain and vexation, sought to fling the urchin off; but he held to his prey like a stoat. For some moments the boy heroically suffered the worst punishment that his master in equity could inflict, returning it with unequal powers. At length, Blast unclasping the urchin's hold, seized him in his arms, and threw him violently off. The boy fell, stunned, against the wainscot. The infuriate savage—his passion raging—was about to deal a blow—it would have been the last—upon the prostrate boy, when Capstick, Bright Jem, and a couple of officers burst into the room. Blast immediately divined their business, and with masterly coolness observed, pointing to St. Giles lying in the corner a senseless heap—"There's your young oss-stealer for you; and a nice job I've had to nibble him. A varmint of a pole-cat as he is."

"The young un and the old un, too," said one of the officers. "Why this is better luck than we bargained for."

Jem lifted up the boy between his knees; he was still pale and senseless. "Mr. Capstick," said Jem, "for God's sake, some water!" Then turning an indignant look upon Blast, he added, "Why, what a paving-stone you must have for a heart, to use a poor child like this."

"A child!" cried Blast, "a young devil."

"And if he is," said Jem, "who's made him one? Murder! why it's the worst of murders; to take and kill all the good in a child's soul, and then to fling him into the world to do his worst, and answer for it."

"There, there, never mind, Jem," cried Capstick, who was turning himself round, and shuffling about, visibly affected by the miserable condition of the child, yet struggling to maintain his outward misanthropy. "All wretches; all alike, worthless animals!" And then he roared at the waiter as he entered—"Why don't you bring some water—some brandy—anything, everything for this poor creature—this miserable—helpless—forlorn—unhappy little boy?" And then Capstick turned his face in a corner, and violently blew his nose, and coughed, and vowed he never had such a cold in all his life.

"There, there," said one of the officers, as Jem bathed the boy's face, "he'll come round again, never fear."

Jem groaned, and shook his head. "Yes, he will come round," he said. "If it was n't that blood would be on somebody's head, it would be a good thing, if he did n't. Lord! Lord!" cried Jem, "to think this is the baby's face I once knew."

"Pooh—pooh!—nonsense," said Capstick; "we've nothing to do with that; nothing at all. The ends of justice—the ends of justice, Mr. Aniseed"—and again the muffin-maker coughed; he had such a cold.

However, whilst Jem—with his heart running at his eyes—is solacing young St. Giles, we will, as briefly as we may, inform the reader of the cause that has brought the muffin-maker and the link-man to Smithfield.

Ever since the conclusion of our sixth chapter—which the urbanity of the reader will consider to be no less than six years ago—fortune smiled upon Capstick. True it is, she often smiles upon

the strangest lumps of men—is oft a very Titania enamored with an ass's head—nevertheless, she showed good judgment in the favors she bestowed upon the muffin-maker. So fortune made interest with her good sister fame to play a flourish on her trumpet in praise of Capstick's muffins; that in time rejoiced many hearths without the circle of St. Giles'. In a word, Capstick soon built an enduring reputation upon muffins; and therefore had a better chance of his name going buttered down to posterity, than has the name of every monarch duly buttered in birth-day ode. Well, the calls upon Capstick's oven were so increasing, that his wife suggested he should forthwith start a horse and very genteel cart. She, good woman! had no eye to a Sunday drive—the vanity never entered her head: all she thought of was business: she was a woman, and therefore had no wish to adulterate it with even a drop of pleasure. Mr. Capstick was somewhat twitted with himself that such proposal emanated from his wife: it was so good, so reasonable, it ought to have been his own. However, he would say, the woman had caught something like judgment by living with him. At once, then, Mr. Capstick consented to the vehicle; and that purchased a bargain, he took his way—in pestilent hour for him—to Smithfield, to buy a horse. Now, Mr. Capstick knew no more of the points of a horse than of a unicorn. As, however, he had little faith in human nature, and none whatever when mixed up with horse-flesh, he said to himself that he might as well be cheated at first hand as at second; therefore, went he alone to buy a steed. Arrived in the market, full soon was he singled out by a benevolent, yet withal discerning dealer, who could see in a twinkling the very sort of thing that would suit him. "A nice little cretur that would eat nothing, and go fifty miles a day upon it." In brief, the worthy man sold it to the muffin-maker, sold it to him for an old song—to be sure, he could afford to let it go thus cheap—the black pony which only two days before had been the valued possession of Lord St. James. For four-and-twenty hours alone did the muffin-man rejoice in his purchase: for on his very first attempt to degrade the high-blooded animal to a cart—it was quite as fit to draw St. Paul's—the creature, although its flowing tail and mane had been ruthlessly docked and cropped—was identified by Cesar Gum, on his way, with a sisterly message, to Short's Gardens. Never before had Mr. Capstick known the full value of a good character. His story of the transaction was received as truth; and though he lost the ten pounds—the value of the old song—he had given for the animal, he maintained his untarnished reputation. Of course, St. Giles was soon known as the horse-stealer. It also came out, that Mr. Thomas Blast had been seen in very earnest conversation with the boy, as he led the pony. Every search was made for Tom; and as, with a modesty not usual to him, he seemed wholly to have withdrawn himself from his native parish, curiosity to learn his whereabouts was the more quickened. Mr. Capstick felt his judgment, his pocket, too, somewhat involved in the transaction. He felt that he stood fair and upright in the eye of the world, nevertheless it would be to him a peculiar satisfaction could he detect Mr. Thomas Blast, or the benevolent, simple-spoken tradesman who—for the price of an old song—had sold the pony. With this wish thumping at his heart, Capstick every day visited

Smithfield and its neighborhood; taking with him Bright Jem, whom he had accustomed himself to think an honest, worthy fellow, and his particular friend; that is, so far as the misanthropy of the muffin-maker would acknowledge the existence of such a treasure. It was strange, however, that Capstick, in his thoughts of revenge, had no thought of young St. Giles. No; all the vehemence of his wrath was roused against the boy's tutor.

We have now, we trust, sufficiently explained the course of accidents that brought the muffin-maker and Jem to Porter-street, and so made them hearers of the unprofitable oratory of Tom Blast. Fearful that they might be recognized by him, they employed a third party to watch him to his haunt, whilst they secured the attendance of officers. Hence, they saw not St. Giles, who, as we have before observed, kept himself close among the mob. They were the more astonished to find the ill-used boy in the same room with his schoolmaster.

"There, now, he's all right," cried one of the officers, as St. Giles—restored by the efforts of Bright Jem—looked about him. However, no sooner was he conscious of the presence of Capstick and his fast friend Jem, than his face glowed like a coal. He hung down his head, and burst into tears: there was no sham whimpering—no taunted effort of sorrow—but the boy's heart seemed touched, melted, and he wept and writhed convulsively. A recollection of the goodness—the disregarded kindness of the men before him—thrilled through his soul, and though he knew it not, he felt the yearnings of a better nature. There was anguish—penitence—in the sobs that seemed to tear his vitals.

"Thank God for that!" cried Jem; and the poor fellow wept, too. "I like to hear that, eh, Mr. Capstick?"

Mr. Capstick felt an old queasiness in his throat, and could say nothing. He therefore again threw himself upon his pocket-handkerchief. Then, conscious that he had a great duty to perform for the ends of justice—a fact, that when otherwise puzzled he had more than once insisted upon—he turned to the officers, and pointing his thumb towards Blast, observed with peculiar loftiness, "You will be good enough to handcuff that man."

"Handcuff me!" cried Mr. Blast. "They'll do it at their peril."

"Ha! my good man—I beg your pardon—you desperate scoundrel!" said Capstick, with withering urbanity; "they're accustomed to do a great deal at their peril: thanks to such rascals as you. Handcuff him."

"They darn't do it—they darn't do it," shouted the struggling Blast; and in a moment afterwards his wrists were locked in iron. "I'll make you pay for this—never mind; it's no matter to me—but I'll make you pay for this," he said; and then, like a Tyburn philosopher, Tom became suddenly reconciled to his manacles.

We will not dwell upon the details of the examination of the prisoners. It will be sufficient for the reader to know that, after certain preliminaries, a sitting alderman committed St. Giles and his tutor for horse-stealing. Both scholar and master awaited their trial in Newgate.

It was not until after the culprit's first examination, that Capstick felt the full annoyance of his position. When Jem would shake his head, and

look dumpish on the matter, Capstick would talk loud, and beg him to think of the ends of justice: but when the boy was committed on the capital charge, the muffin-maker's public spirit wholly forsook him. Evidence had brought the accusation quite home to the boy; however legal proof might fail to criminate his tempter. "They'll never—never think of much hurting the boy—a child, you know—a mere child," said Capstick to Jem, as they left Guildhall together.

"Humph! I don't know what you call hurting, Mr. Capstick," said Jem, moodily. "But I should n't think hanging pleasant."

Capstick turned pale as flour, and he could scarcely articulate the words—"Impossible—ridiculous—they could n't do it."

"Ha!" cried Jem, "when hanging's the thing, you don't know what they can do. Well, I'd rather ha' been in bed, with a broken limb, than had a finger in this matter. I shall have that poor child always about me; I know I shall. When he's killed and gone, I shall never take my pipe without seeing his face in the fire. And then my poor old woman! She that still's so fond of him—poor orphan thing! for his mother's worse than lost to him—she'll lead me a nice life—that is, though she won't say anything outright, she'll always be a crying about him. We've done a nice thing, Mr. Capstick, to make our lives pleasant as long as they last!"

"Pooh, pooh—folly, Jem; all folly. I suppose property must be protected. I suppose you won't deny that, eh?" asked Capstick.

"I deny nothing," answered Jem hopelessly; and then he groaned "God help us! Why did n't he die in the frost and snow! Why did I warm him, when a babby, at my own fire, only to help to hang him arterwards?"

"Hang him! Nonsense! I tell you, Jem, you're a fool—an old, butter-hearted fool—and you know nothing: here have you lived all your life with the worst of people about you—not but what folks at the very best are great rascals, every one of 'em—but here have you been up to your ears in villany—and yet you look upon everybody about you as innocent as shepherds and shepherdesses in white china. I'm ashamed of you, Jem; be a man, and think of the world as its rascality deserves. For, Lord! what a lump of roguery it is! How that the blessed sun should ever condescend to smile upon such a lot of wretches as we are, I can't tell."

"No more can I," answered Jem; "but since the sun, as you say, does condescend to show a good face to us, I think it's as little as we can do to try to do the same to one another."

Capstick, taken somewhat aback, looked suddenly round upon Jem; and then, feeling himself wholly unable to controvert this opinion, he simply said, "Jem, you're a fool."

A week passed on, and the trial of St. Giles approached. It was strange to Mr. Capstick that so many of his customers would ask him about his health. "Why, what can ail the people?" he would say. "I was never better—never in all my life. I eat like a pig, and sleep like a dormouse: can any man do better than that?" But Mr. Capstick was not well. The biped pig made poor meals; the human dormouse had restless nights: and when dreaming, dreamt horrid visions of death and Newgate.

It wanted some ten days of the trial, when Bright Jem presented himself at Capstick's house.

"You see," said Jem, "they're getting some money in the Lane so that they may have a lawyer for poor St. Giles. Well, they're a bad lot, I daresay: but you should only know what some of the poor souls have done."

"And what have they done?" asked Capstick, with what he meant for a sneer.

"Why, some as had two blankets have sold one on 'em; some with two gowns have pawned one o' them. It would make you bless yourself, Mr. Capstick, to see besides what things they've made twopences and threepences of—kettles, sarcepans, anything. It's wonderful to see how they do stick by one another."

"Crime, Mr. Aniseed, crime is a brazen cord—and certainly does hold rogues together," said Capstick.

"You may say what you like," said Jem, "but whenever I've looked up that horrid Lane, and seen men and women like devils, and children—poor creturs—like devils' little ones—I never could have thought that in that dismal place there was after all a sort of good, that the very best of us would n't be any worse for more of it."

"Very like; very like," said Capstick. "And I am to understand, that the people want to fee a lawyer?"

"That's it," replied Jem. "There's a Mr. Tangle, somewhere in Clifford's Inn; he's a sharp un: they say he'd get a chap out o' Newgate; get him out through a flaw no bigger than a key-hole. Well, I've been thinking—not that I can do much—but I've been thinking that as we helped to get the boy into Newgate, if we was to give what money we could to help to get him out."

"And so defeat the ends of justice?" cried Capstick, and he frowned severely.

"Oh, I daresay it's wrong," said Jem; "nevertheless, if we could only get the boy safe off, he might be a good un after all. Did n't you hear how he cried! Oh, there's heart in him yet, I'm sure there is. Well, then, you see—"

"I see perfectly," said Capstick, "you've come to ask me to subscribe to the fund for the lawyer?"

"Well, that's just it," assented Jem.

"Forgetful of my serious responsibility as a witness—forgetful of the ends of justice—forgetful of what I owe to society—forgetful—"

"Forgetful," cried Jem with animation, "of everything except of saving a child from the gal-lows."

"Mr. Aniseed," said Capstick very decidedly, "I am sorry to refuse you anything, but you must not let your feelings blind you: you mean well, but you have yet to learn that the best meaning men are those who so often do the most mischief. In a word, sir, I can have nothing to say to this business."

Bright Jem made no answer, but with a moody nod, was about to leave the shop, when the muffin-maker called to him. "I think you said this attorney's name was Wrangle?"

"Tangle," said Jem, shortly.

"Tangle, Lyon's Inn," said Capstick.

"Clifford's-Inn," cried Jem, a little sulkily, and then he darted from the shop.

It is most true that Mr. Tangle deserved the high reputation bestowed upon him by Jem. His office in Clifford's-Inn was looked upon as a pri-

vate way out from Newgate. Many and many a time, when the fatal halter seemed inevitable, has he, by some deft device, turned the running into a slip-knot, and the hangman has been defrauded by the quibbler. Many a gentleman had Mr. Tangle restored to the road, none at all the worse for Newgate. Many a highwayman, on his solitary midnight watch, might think with gratitude of the master-spirit of Clifford's Inn.

It was the evening of the day on which Bright Jem solicited Capstick, and Mr. Tangle sat in the solitude of his chambers. He was sunk in profound study; possibly, pondering how to find or make a flaw: how to give to the line of right a zig-zag, profitable bend, for some consulting client shut in Newgate stones. His clerk was out: therefore, his knocker being struck, he rose himself and opened the door. A tall, bulky man, wrapped in a great-coat, a hat slouched over his face, tied by a handkerchief that almost wholly covered his features, stalked into the room. Mr. Tangle was not at all surprised; not at all. So many odd people, so strangely appointed, every session called upon him.

"You are Mr. Tangle," said a voice that most assuredly belonged to Capstick, the ruffin-maker. Mr. Tangle bowed. "You are interested in the case of a boy, one St. Giles?"

"I have been consulted," said Tangle in his dry way. "A bad case; confessedly, a bad case; still, something may be done. You know till a man's hanged there's always hope; that is, if there's always—"

"Money." Mr. Tangle smiled and nodded. Mr. Capstick took a small leathern bag from

his pocket, from which he counted out ten guineas. "I am not a rich man, Mr. Tangle," said Capstick.

"I am sorry for it," said Tangle, (and evidently with a feeling of sincerity;) "otherwise the ten might have been fifty."

"But do what you can for that wretched boy—only save him from hanging, and there's twenty more."

"Thirty pounds," said Tangle; "it's doing it—if indeed it's to be done at all—very cheap; too cheap. Nevertheless, as you're not a rich man, I'll not refuse money. What name?"

"Never mind that," said Capstick. "I think I've given you enough to show that I'm in earnest. Now, only save the child, and as God's in heaven you shall have the other twenty."

"We'll see what can be done," said Tangle, showing Capstick to the door—"I have hopes; great hopes."

And the trial came on, and St. Giles and Thomas Blast were arraigned for stealing a pony of the value of fifty pounds, the property of the Marquess of St. James. Nothing could be clearer than the evidence against the boy, as delivered by young St. James, Mrs. Simmer, and her servant. But legal proof was wanting against Blast. True, he had been seen talking to St. Giles, as the boy led the pony; but nothing more. There was no doubt that the man who had taken the animal from St. Giles in Long Lane was an accomplice of Blast's, but he was not to be found—there was no proof. Whereupon, Thomas Blast was acquitted; and young St. Giles found "Guilty—Death."

THE BELLS ON SUNDAY MORNING.

Translated for the Protestant Churchman, from the German of Agnes Franz.

Up, up, the day is broad awake,

The stars have gone to bed,

The glorious sun is spreading fast

His banner o'er our head;

And, hark, from the heights the merry bells ring,

'Tis a message from heaven to earth they bring;

"Up, up, from your sleep break away,"

The morning breeze wafts the chimes along,

Arousing the birds to their morning song;

"Think of the Lord—think of the Lord,

Who has given another day."

The mother wakes her little one,

And teaches him to pray

And praise the Lord, who has begun

Another blessed day.

The night has gone with its chilling fears,

And the warmth of the cheerful light appears,

And the bells ring merrily;

She bends with a pious heart to hear

The voice which the chimes are wafting near,—

"Praise ye the Lord,

Praise ye the Lord,

Who has tenderly guarded thee."

The sick man tosses to and fro,

Trying in vain to pray;

The cheerful sun but comes to show

A sad and suffering day.

"Who cares for a friendless soul like me,

Who cares for the sick in their misery;

Alas! there is none to hear."

Then suddenly burst from their heights above,
The chimes of the bells with their voice of love,

"Rest on the Lord,

Rest on the Lord,

Who treasures up every tear."

The rich man on his bed of down,

Is scarcely roused to hear

The merry chimes, alas! they fall

Unheeded on the ear.

Thou idler, awake—each moment of thine

Is a talent but lent by a Master divine;

Be ready the bond to pay!

Then hark to the chimes as they're floating past,

They tell thee thy moments are flying fast;

"Think of the Lord,

Think of the Lord,

And the awe of the judgment day."

Oh, holy, blessed Sunday bells,

Ye bring us from above,

The tidings which each bosom swells,

Of God, the Father's love;

Long may your echoing chimes rebound,

And over the heathen land resound,

Till all in one harmony blend.

Then arouse to the voice when the matin bells ring,

For a message of love from the heavens they bring,

"Think of the Lord,

Think of the Lord,

Who pities and loves to the end."

M. W.

From Chambers' Journal.

A FEW DAYS IN A FRENCH CHATEAU.

BY A LADY.

I OFTEN wonder at what has been a thousand times wondered at already—the remarkable resemblance between the course of events in English and French history. A king possessing many good qualities, falling on evil times, is carried by his people to the scaffold. Next follows a pretended republic, which merges in a military despotism. This ends, and then comes back the old reigning family. But this family not conducting itself properly, loses the popular affection, is turned adrift, and a far-off cousin is elected king. To make the parallel pretty nearly complete, the family of the dethroned monarch lives in a distant land, hoping for better times, and retains a hold on the loyalty and compassion of certain old families of distinction, whose feelings cannot brook an unhesitating submission to the powers that be. One thing more, indeed, as respects France is still wanting to render the resemblance complete—an insurrection led on by these old-fashioned loyalists, and fruitless in everything but utter ruin to their expiring cause.

No such mad freak having yet occurred, the legitimists of France, as they are pleased to term themselves, occupy a position parallel with the Jacobites in Scotland and the Cavaliers in England, a short time before their annihilation as a party by the rebellion of 1745. In the same manner that these sturdy Jacobites and Cavaliers used to shun the court of George I. and II., and live in grumbling retirement in their old castles and halls, so do the legitimists of France eschew the court of Louis Philippe, and shutting themselves up in their chateaux or their town mansions, live but for their families, and dream only of a second restoration. James III. was "the king over the water," who, the Cavalier party declared, should one day "enjoy his own again;" the young Duke of Bourdeaux (nominally Henri V.) is the object of veneration among the saddened adherents of the Bourbons.

Visionary as everybody now allows the projects of the Cavaliers and Jacobites to have been, nothing can make me disbelieve them to have been a noble set of men—gentlemen of high principle, brave, generous; their very misfortunes making one almost love them in spite of their manifold errors. Had I lived a hundred years ago, I dare say I should have attended the ball of "the prince" in Holyrood, at least if so gallant a personage as Fergus M'Ivor had asked me. I am certain I should have wept the fate of Lords Kilmarnock and Balmerino and Charles Ratcliffe; and even now I have a degree of tender regard for the "bonny white rose," the emblem of the unfortunate house of Stuart. Of such poetical inclinations, it will not be thought surprising that, on a late visit to Paris, with a party of friends, I should have wished to see and know something of the old loyalist families who still cling to the *fleur-de-lis*—the De Sullys, the De Montmorencies, the De Choiseuls, and other remnants of the shattered noblesse.

In ordinary circumstances it is no easy matter to become acquainted with these families; for they do not mingle much in general society. The few who dwell in Paris reside in the Fauxbourg St. Germain, a *quartier* which has now become synonymous with their party, and the inhabitants

of which are associated in the mind with the brilliant court of Louis XIV. The loyalists who have retained their fortunes display their taste for magnificence only in the sumptuous adornment of their palace-like houses, and in the splendor of their equipages. The brilliant *toilette*, so dear to all other Frenchwomen, is by the ladies of these families discarded, and replaced by the neatest and most simple attire. Their manners partake of the same simple character; they are frank, and at the same time polite; merry without being boisterous, and never exacting; for they have been schooled by that best of teachers—adversity.

A previous acquaintance in London with certain members of one of these ancient and noble families, was now fortunately instrumental in bringing us an invitation to spend a few days with them and their venerable relative at their seat in the country; and as life in a French chateau can be but little known in England, I propose—adopting, as may be supposed, fictitious titles—to attempt a sketch of what fell under our observation at the chateau of our new but valued friend.

The Comte de Beaulieu, one of the sons-in-law of the nobleman to whose country-house we had been so hospitably invited, offered to come to Paris to escort us to Linière; but this stretch of politeness we positively declined, and only would consent to meet him at Versailles, where we intended to remain for a few days previous to quitting France. Behold our party, then, at Versailles, where, on the appointed day, the comte made his appearance; and after an interesting stroll with him through some of the private apartments of the palace, to which he had special access, we set off for Linière early in the afternoon, and under as bright a sun as ever shone on la belle France, being preceded by the comte, who drove an elegant open carriage, built from a design of his own, and drawn by a pair of fine English bay horses. The excursion was short and delightful. Passing through a district of country tolerably wooded, we had here and there a glimpse of an old chateau, whose white walls contrasted finely with the bright green of the trees which surrounded it, and were thus prepared for what we might expect at the conclusion of our drive. On we went, and in about two hours arrived at the park gates of Linière. At the head of an avenue of trees stood the mansion, a fine pile of building, with a spacious flight of steps in the middle, from the top of which, on each side, branched off a terrace with a balustrade of stone running across the front of the chateau. The steps at both sides were flanked by quantities of geranium and other fragrant plants in full bloom, which imparted an air of elegance to the scene.

At our near approach, the venerable master of the house, the Marquis de Tourville, accompanied by another of his sons-in-law, the Vicomte de Saint Prosper, descended the steps where they had been waiting some time. The truly hospitable and kind manner in which we were thus welcomed, could only be equalled by that which we experienced from the ladies, when, a few moments after, we arrived at the vestibule, where they reiterated the same kind expressions in the most engaging manner. We then walked through the antechamber and billiard-room into the drawing-room, where we chatted for a short time, and then adjourned up stairs, preceded by the Marchioness and the Countess de Beaulieu, who pointed out our individual apartments, and quickly retired, warn-

ing us that we had not much time before dinner for the duties of the toilet. In a short time the great dinner bell rung, and when the ladies tapped at our door to conduct us to the drawing-room, we were not quite prepared to descend. When we made our appearance in the drawing-room, we found all the family assembled: therefore, whilst waiting for the announcement of dinner, let me describe our host, hostess, and family. The marquis numbers more than seventy years, although he does not appear so old: from his military bearing, no portion of his height is lost, and this, combined with an aqueline nose and eagle eye, give him such an imposing presence, that one cannot approach him without feeling a degree of awe. From infancy he had been in attendance upon Maria Antoinette, as his family was one of those who enjoyed the intimate acquaintance of that unfortunate queen.

The marquis in early life joined the allied army, and is linked in the dearest bonds of friendship with some of our brave old generals with whom he had served. After the Restoration, he was reinstated in his former rank and position, and succeeded in regaining a great part of his fortune. When Charles X. ascended the throne, he was intrusted with a high and responsible command of great honor, which he filled up to the moment of the Revolution. He has ever since lived apart from the court, and never takes his seat in the Chamber of Peers unless some question involving the vital interests of his country is to be agitated. The marchioness is the descendant of one of the most renowned families in France: her mother and grandmother both perished under the guillotine. She has passed middle life, is peculiarly graceful both in person and manner, has a sweet but sad expression of countenance, and in youth must have been beautiful. She dresses to perfection; never tries, by any youthful denudings, to take one year off her age; and wears her own nice gray hair. Her family consists of three daughters, who are all married. The eldest, the Countess de Beaulieu, always resides with her parents; she is an elegant, self-possessed, intelligent woman, with a very engaging expression, and excels in music and painting. She has six children. The comte, who is the heir of a house as ancient as that of his wife, is a handsome, dark-complexioned man, and highly accomplished. The youngest daughter, who was staying here, resembles a lovely young Englishwoman; she is a beautiful blonde, and is married to the Vicomte de Saint Prosper, eldest son of the Duke de Saint Prosper, with whom they reside nine months every year, the other three being passed at Linière. The vicomte is a tall, handsome, fair-complexioned man, and so much like a John Bull, that he has frequently been mistaken for an Englishman. They have also six children.

On dinner being announced, the marquis politely offered one of us his arm, with the air of an old cavalier, and the rest of the company followed. According to French custom, the host and hostess sat at opposite sides of the table, on which the display was simple and tasteful, the eye being feasted as well as the palate. I was particularly struck with a large and handsome basket occupying the middle of the table, and filled with the most beautiful flowers. As soon as the soups were despatched, and the covers removed, an immense joint of roasted beef, as a compliment to us, stood revealed, towering over all the delicate

dishes. After three courses, which would have done credit to Ude himself, the table, with the cloth still on, was replenished with the most delicious fruits, sweetmeats, and iced creams.

The conversation during dinner, which lasted about two hours, was lively and entertaining. A number of merry stories were related of the mistakes made by English people in France, and *vice versa*; indeed the Comtesse de Beaulieu told some very laughable anecdotes of her own experience in London. After finger-glasses were handed round, we were all escorted back again in the same order to the drawing-room. On the way, we saw eight lovely little girls, all dressed alike, playing in the billiard-room. They accompanied us into the drawing-room, and as soon as coffee was dispensed, the party quickly broke into little social knots. Music, conversation, and looking at the gentlemen playing billiards in the adjoining apartment, made the evening pass most agreeably. When the drawing-room was lighting up, a new contrivance struck us as having a pretty effect. Two brilliant lamps were placed in superb china vases, on each side of the mantel-piece, throwing down a light upon a pyramidal stand of flowers, which entirely concealed the fireplace. Tea was served at a late hour. The marquis told us that, although they always had this beverage in Paris, they had not yet habituated themselves to it in the country. Tea, indeed, is still a rare luxury among the French.

We had been so long accustomed to the narrow and uncomfortable beds in French hotels, that when, on having retired for the night, we sunk in capacious down couches, with linen akin to cambric, and pillows trimmed with fine lace, we could scarcely credit our senses that we were really in France. We arose early to enjoy the delightful view from our windows. The beautiful park, studded with lofty clumps of trees, reminded us of merry England. At eight o'clock the waiting-maid of the marchioness brought in a large tray covered with a napkin, upon which were placed tea, coffee, hot rolls, butter in curious devices covered with pieces of ice, and suddy kinds of cakes quite hot. The cups and saucers were each ornamented by a marquis' coronet, and were of the finest Sèvres china. The entire establishment being conducted by men-servants, with the exception of the respective waiting-maids and nursery attendants, was the reason that the marchioness, in consideration of our English prejudices, was so kind as to let her own maid bring in our breakfast, which we enjoyed very much.

Fain would we now have rambled about the grounds, but, knowing that it is customary for the ladies to stay in their own rooms until the bell for the *grand déjeuner*, or general breakfast, summons all the family, we constrained ourselves to conform to the rules of the house. By adhering to this plan, each separate family is enabled to make their own private arrangements, and give their orders for the day, the remainder of which they spend together free from household cares. The ladies have each a cup of coffee at eight o'clock, or earlier, and the gentlemen also when they are indisposed, but not otherwise. Prevented from going out, we took the opportunity of taking a look round the apartments allotted for our use. Our bedrooms were very large, carpeted all over, and superbly furnished with footstools, arm and small chairs, sofas, marble-topped cabinets, chests of drawers, dressing-tables, and last, but certainly

not least in our estimation, capacious mahogany bedsteads, terminating at each end in Greek scrolls, and provided with two sets of curtains, appended to a gilt coronet fastened into the wall, the outside hangings light-colored silk, to match the window-curtains, the inside ones fine clear white muslin. In the centre of each bedroom stood a library table, furnished with writing materials, matches, waters, almanacs, wherein the saints' days were peculiarly notified; and these articles complete the list, with the addition of hanging pin-cushions at each side of the large looking-glass which stood on the mantel-piece. Attached to each sleeping apartment was a handsome dressing-room, leading to another small apartment designed for a waiting-maid, from which there is an exit to the corridor. Each visitor therefore may be said to have a cluster of two or three private apartments. The other parts of the mansion are on the same princely scale. It was built in the reign of Louis XIII., and consists of a centre two stories high, with a wing at each side of the same height. Staircases lead to the long corridors, which run from one end of the chateau to the other, and from which all the bedrooms are entered. The lower corridor is hung with family portraits—knights and belles of "high degree"—and is lighted by the windows which form part of the façade. The lower floor of one of the wings contains the suite of rooms appropriated to the marchioness, the other those of the marquis, and the entire upper part of each is occupied by the children, their servants, and English governesses. The drawing, billiard, and dining-rooms, are noble apartments, and, with antechambers, run the entire length and breadth of the chateau. In one of the drawing-rooms is placed a marble bust of the Duke de Bourdeaux, in a most conspicuous position. It is valuable both as a likeness, and as a fine work of art. Luxury and comfort are singularly combined in this charming room, from which the grounds can be entered by means of a flight of steps.

The ladies had the kindness again to call at our door, to convey us down stairs as soon as the bell rang for general breakfast. We found all the family assembled in the drawing-room. Some of the gentlemen had been walking in the grounds, others in the village, and the intellectual comte had been giving his accustomed German lessons to his daughters. We were all conducted in the same order to the dining-room as we had been the preceding evening. We found the beautiful polished table covered by a delicious melange of poultry, joints of roasted meat, bread, cakes, potatoes in divers forms, and most recherché made dishes. Tea, coffee, and chocolate were poured out from silver pots by servants at each person's desire, the cups and saucers alone being placed on the table. Eggs, poached and dressed in oil, we found to be delicious: they were, however, served singly in small earthenware pipkins with handles, which certainly appeared rather incongruous amongst such a brilliant display of plate. Sweetmeats of the rarest and most curious description, strawberries, cherries, and various fruits, some of them iced, were also present; likewise wines and liqueurs—the whole reminding me of the far-famed breakfasts of the Scotch. The absence of a table-cloth, however, gave a foreign air to the repast. Finger-glasses, as at dinner, was the signal for rising from table, when we were again marshalled to the drawing room, where all the

children were assembled; preparatory to their walking out. They breakfast at halfpast seven o'clock, and have all their lessons over by twelve, after which they take exercise and dine. Music, reading, and different kinds of needlework occupy them until five o'clock, when they take some light supper, and appear in the drawing-room, after their parents' dinner, for about an hour—a custom which is infinitely preferable to the English habit of admitting a troop of children into the dining room during the dessert.

Having settled ourselves in the drawing-room, some of the party sat down to embroidery, and others to reading, the table being covered with newspapers just arrived from Paris; whilst we visited by invitation the apartments of the marchioness, which, as before observed, occupy all the ground-floor of the left wing. We entered her library from a door in the drawing-room leading into it, and were much pleased to find such a choice collection of French translations of English works, as madame cannot read them in the original. Sir Walter Scott's works occupied a large space. We were much amused, on opening one of his novels, by seeing an attempt at a translation of Edie Ochiltree's Scotch; and a very queer attempt it was. In a recess stood a handsome bedstead, draped with pale blue *gros de Naples*, covered by the most beautiful and delicate lace-work of that species called *application*. The coverlet and toilet-cover were likewise of the same material; the former was flounced round in a corresponding pattern. All these elegant specimens of needlecraft have been the result of the marchioness' own industry. In the middle of a large bow-window stood the toilet-table, covered by a profusion of silver, gold, china, Venice glass, and colored stone dressing utensils. Near the fireplace is hung a rosary, in a glass-case, which was pointed out to us with pride and veneration, as it is believed to contain a piece of the true cross. The beads are formed from precious stones. This interesting object was presented to an ancestor of the marchioness by the celebrated Père Joseph, the friend and agent of Richelieu.

The gentlemen and the marchioness having proposed a walk through the grounds, in order to show them to us, we readily assented, and were greatly pleased with the excursion. The walks were diversified, and so well laid out, that from different points of the higher grounds we had charming prospects of the country around, including the old village and church of Linière. Finally, we visited the orangerie and hothouses, and were then conducted by the marchioness to her favorite spot, laid out to resemble, and called an English garden. She showed us a small parterre of pretty Scotch roses, which had been sent her as a present from the venerable Lord Lynedoch, a brother in arms of the marquis. We had scarcely returned to the house, when we were told to prepare for a drive, as they wished us to see some of the neighboring chateaux. When we were ready, three handsome equipages drove up—a caleche, Brougham, and the Comte de Beau-lieu's favorite, each drawn by a pair of fine English horses. We visited two chateaux. One of these contained a rare collection of paintings by the old masters, hung in a gallery evidently copied from the Louvre. The luxury of everything there was regal. Precious bronzes and antique marble busts were distributed through the apartments.

The dining-room was worthy of Lucullus. The house had belonged to one of the ancient noblesse, whose widow, after his decapitation, had been obliged to sell it for a trifle to a citizen. This man had a daughter in whom all his wealth centred; she married a young member of the old aristocracy, and is now a widow with two children. Some years back, her husband was sent as ambassador to England by Louis XVIII. We were particularly struck by the sofas with awnings dispersed through the grounds, and by an octagon room, some of the windows of which opened upon the lawn; they had also awnings over them, and at each side of the steps flowers in vases. A beautiful ornamented cottage in the grounds was most tastefully furnished, and would make a charming summer abode. The riding house and some of the stables are built with the stones which once formed a part of the celebrated convent, the "Port Royal," where the virtuous Arnaulds flourished so long, both as reformers and as the great supporters of Jansenism. At the other chateau the garden pleased us most. The noble duke who is the proprietor seldom visits it; therefore it presented a very different appearance from the one we had just quitted. On our return we entered a very ancient church, with most exquisitely painted windows. Madame de Beaulieu was much pleased at her eldest daughter, nine years old, being able to recognize and narrate the different Scripture histories set forth thereon. As soon as we arrived within sight of the great altar, all our friends, gentlemen as well as ladies, dropped upon their knees, and appeared for some minutes to be lost in devotion. After a delightful drive, we returned to Linière just in time to dress for dinner.

As I have now detailed our proceedings for one day, it would be only a vain repetition to continue to do so, as nearly every hour was spent much in the same manner, with some exceptions; as, for instance, when the day was wet, we each took our work and had some interesting conversation. The marchioness was engaged upon the finest piece of needlework we ever saw, which is intended as a cover for the great altar in her own church at Linière. Every day, after our first breakfast, we read until the general one, always over night providing ourselves with the books which we desired to peruse. During a morning excursion we visited the ruins of one of the strongholds of the bold Jean de Montford, Duke of Brittany, celebrated in one of the ruthless wars of the fourteenth century.

During our stay we had many animated discussions relative to the difference both in manners and customs of our respective countries; but they all ended, as such conversations generally do, by leaving each individual wedded to the opinion expressed at first. One part of French chateau life had for some years puzzled us, but we think we understand it *now*; I allude to the harmonious manner in which many branches of one family reside under the same roof. The Marquis de Tourville, one day, when speaking on this subject, said he rejoiced to entertain us at his chateau, that we might witness the patriarchal manner in which he lived with his daughters and their husbands and children, among whom never a jar occurred. I am inclined to ascribe this felicity to the strict etiquette and habitual politeness of the French. Although all relations, and living together in one house, each branch keeps itself to itself, and no one takes

undue liberties with another. I observed that the two sons-in-law of the marchioness always addressed her as *maman*, or *ma chère maman*. One tolerably obvious reason for this clubbing together of families is narrowness of fortune. It will also be recollected that, by the new law of inheritance in France, properties are divided equally among the children, and all seem to maintain an equal hold on the paternal feelings. While acknowledging that this practice of equal division seems the most reasonable and just, I have, after all, doubts of its general efficacy. It no doubt appears scandalous, that, by our law of primogeniture, while the elder son gets all, the younger sons get nothing; yet it causes universal exertion, and is probably best for the nation at large. Few things are more striking to a stranger in France than the hosts of genteel idlers everywhere—men waiting for slices of their fathers' fortune; and it would not, I think, improve society in England to fill it with such a class of persons. I am, however, no politician, and speak diffidently on a question of such moment.

At the chateau, a German gentleman had been invited to meet us, and to remain for some days, as he had the reputation of speaking English fluently. When this worthy man, however, was placed next one of our party at dinner, not a word could he muster in our language; and he appeared to discover for the first time that reading and speaking a foreign tongue are two separate things. He, however, conversed fluently in French; and being a very well informed man, we considered him a great addition to our little society. He bore the jokes passed upon his failure of English with much good humor. The perfect harmony which prevailed in this family was delightful to witness. The venerable marquis was considered by the children as common property during the hour they remained in the drawing-room after dinner. One beautiful urchin climbed his knee; a little girl seated herself on the other; one pulled his hair; another mounted on his back: in fact, he resembled Gulliver when the Lilliputians covered him all over. The parents were likewise besieged; but the instant the time for going to bed arrived, there was no hankering, no shuffling, to gain half an hour. Strict obedience was demanded, and, I must say, cheerfully paid. The Comtesse de Beaulieu's two eldest daughters played the piano remarkably well. The second, who is only eight years old, is quite a musical genius. Both conduct themselves like women. They asked us such intelligent questions relative to our country, which they are most anxious to see, that it was a pleasure to answer them. They both speak and write our language correctly. The young vicomtesse has two lovely little boys who were beginning to lisp English; and from what I saw and heard here and elsewhere, I should imagine the time is not far distant when every one among the higher classes in France will be able to speak English as well as ourselves. The constant intercourse with England and America is forcing on this result.

I am now brought to the conclusion of my visit. The day of our departure from this charming mansion arrived, and we were obliged to bid adieu to our friends, whom we quitted with much regret, mingled with gratitude, for the very kind and hospitable manner in which we had been treated during our stay in the chateau.

From Chambers' Journal.

RAILWAY LITERATURE.

AMONGST the very great alterations in our social system which railway extension over the breadth and length of Great Britain has produced, the effect it has had upon literature should not be overlooked. Railways have created a new class of publications exclusively devoted to their interests. They have called into existence not merely a new branch of literature, but a whole literature of their own, with each department definitely marked and industriously filled. They have their useful, serious, business books and periodicals for the public to consult, as it does the Ready-Reckoner or the Times newspaper. They have also their light and graceful belles-lettres, which the fashionable world is beginning to prefer to common-place poetry and blasé fiction. A glance at this new and comprehensive literature will assuredly be instructive of the ever-advancing progress of this country.

In the useful department, preëminence must be given to a neat waistcoat-pocket compendium, which is as portable as the tiniest Ready-Reckoner, and quite as necessary to the man of business. It may be with truth designated the traveller's best companion, although its real title is "Bradshaw's Railway Guide." It consists of a set of tables, interspersed with distinctly engraved maps. The tables tell us the respective distances, the times of starting from and arriving at every railway station in Great Britain; to which is added a list of the fares for each distance. Supposing, therefore, a man to be lounging in the neighborhood of John o' Groat's a few years hence, (when all the railways in this island shall have been complete,) and he possess a copy of Mr. Bradshaw's miniature time-book, he will only have to make one or two references to it to be able to inform himself of the hour, nay, of the precise minute, at which he would arrive at the Land's End in Cornwall. Even by the aid of the edition now before us, a traveller being in Newcastle-upon-Tyne, may very safely order by post a dinner for the next day at Mr. Wynn's excellent hotel in Falmouth at a certain number of minutes before or after any particular hour; and start with the assurance that, though he will have to go over some four hundred and sixty miles—not of ground exactly, but of iron rail—he will be nearly sure of finding himself seated at table just as the Falmouth cook is dishing up the pilchards. He can also, before setting out, calculate from the lists of fares the exact amount of money the excursion will cost him, and know, by consulting the maps, through what counties, towns, and villages he will pass. All this information, and much more about steamboats, coaches, and carriers, is compressed into the smallest possible compass, and bound up in a neat cloth cover.

Next in utility, though perhaps far above Mr. Bradshaw's little work in point of importance, come several newspapers, which are exclusively devoted to railway affairs. Those already existing are the Railway Journal, the Railway Times, the Railway Record, and the Irish Railway Gazette, published weekly, and the Railway Register, issued monthly. All these periodicals are conducted by scientific men, with a high degree of respectability and independence; the last, a most essential qualification; for their conductors are manifestly more open to temptations of partial-

ity and favoritism than any other class of editors. Hence there resides much influence in these journals for good or for evil. Being looked up to by the public as authorities on the subject to which they are devoted, they have the power either to puff off unstable schemes, which are never intended to be carried further than the share market; or, by dint of cautious inquiry and fearless exposure, to guard capitalists against them. As vehicles for the publication of various transactions connected with old as well as new lines, they put their readers in possession of data upon which to form correct opinions concerning the actual condition and progress not only of particular companies, but of the aggregate of the new but gigantic interest which is now centred in this mode of conveyance. To the honor of all the important companies be it spoken, open unconcealed trading appears to be their rule of conduct, and each publishes a weekly account of the amount of business done during every eight days. Under the head of "Official railway traffic returns," there appears in the railway newspapers a table setting forth the money received for the transit of passengers and goods. That every means of calculation and deduction may be afforded to the interested reader, beside this item is placed the amount of receipts of the corresponding weeks in as many previous years as the line has been in operation; also the authorized capital of every company, the amount of its periodical expenses, and the dividend per cent. received by each shareholder at the last division of profits. Thus, by the aid of the railway journals, a person who wishes to invest money may know the exact value of the shares he would purchase on the very day he desires to buy them; and, moreover, be able to form a tolerably correct notion as to whether the property is likely to improve, or to become deteriorated in value. Thanks, therefore, to the exertions of "railway editors," there is no species of property which a capitalist can purchase with his eyes so widely open as railway property; for if he wishes to invest his money in houses, he must depend greatly upon the opinion of his builder, or upon the interested report he gets regarding the character and responsibility of the tenants. If, again, he desires land property, he is almost entirely in the hands of his surveyor; but, in buying railway shares, he has only to consult the railway newspapers, and he may judge unerringly for himself. To assist him in such cases, the "Railway Record" attaches to its weekly account "Notes on the traffic table," in which is set forth a short statement of the condition (whether finished or not) of the line, or any specialty in the monetary affairs of each company.

There is one peculiarity belonging to these newspapers which, so far as we recollect, no others possess. They are entirely and unmixedly devoted to their one subject, to the exclusion of every other description of matter whatever. The military and naval journals contain short accounts of what is going on in the civil world; the doings of laymen are recorded in the religious papers; and, in short, most of the publications addressed to special classes show some little sympathy with the ordinary affairs of life by some brief chronicle of them. Not so with the papers under consideration. We have one before us, for instance, containing twenty-four pages of close print, and not one single word relative to anything besides railways. So inflexible do the conductors appear in

this respect, that they even exclude the flourishing eloquence of puffing advertisers. Out of ten pages of advertisements, not one but has direct or indirect reference to railways. Besides several of the official advertisements of the various companies, they consist of announcements of patent inventions for particular parts of railway machinery, of the names and addresses of share-brokers, and other announcements only relating to railways. The news is equally exclusive. Reports of meetings of companies, letters from aggrieved travellers or disappointed shareholders, information concerning foreign railways, railway police reports, with a leading article, and an essay or two on locomotive topics, form the sum of contents in a railway newspaper.

From the researches we have made from time to time in these very exclusive vehicles of railway information, we may conscientiously say that—considering the temptations we have before hinted at which lie in their way to diverge from the straight line of honesty and truth—a better conducted class of newspapers does not exist. Some, of course, are better than others; but it would be as invidious as unnecessary here to make distinctions.

A few of the temptations to which railway editors are exposed, may be mentioned in the second section of our little treatise on the useful department of railway literature. The readers of general newspapers may have observed that almost every one of these organs, whether provincial or metropolitan, devotes a column or so to "Railway Intelligence," in which all the several haps that the railway is heir to are duly chronicled. Where, in the case of a provincial paper, a line is projected or in progress through the district in which it is published, that of course forms the subject for the exercise of the editor's pen—the pivot on which to turn the graces of rhetoric in his leaders. When rival lines are proposed, rival newspapers naturally take a stand in their favor, and a fierce pen and ink war ensues; which introduces us to the controversial department of railway literature. Without hinting a breath of disrespect against provincial editors as a body, we may now produce our instances of the temptations to tergiversation to which they are exposed. We learn from one of the parliamentary reports, that in a certain district a warfare between two rival companies ran so high, and was so energetically supported, that the older of the projecting companies thought it expedient to "buy off" the opposition of their vigorous opponent, and he was soon able to present an exception to a very general rule; namely, that of a literary man retiring upon a fortune! In his case railway literature had proved a golden egg, though he managed to hatch it under very discreditable circumstances. Another even stronger example of the height to which literary warfare has been carried, is mentioned on good authority. In a midland county, an editor wielded his facts and his logic so manfully, that, in the opinion of the opposed company, he created an effect upon the minds of his readers far too serious not to damage, perhaps to overthrow, their project. Against bribes—unlike his above-mentioned brother journalist—he was proof. A new paper was started in opposition, but the leaders were weak and ineffective compared with his. Every scheme was tried that ingenuity could invent, or cash execute, to silence him; but the more this was attempted, the stronger he wrote, and the

more fiercely he denounced the scheme. At length one of the directors hit upon an expedient worthy of Machiavel. He got himself cautiously introduced to the proprietor of the journal, professed a desire to risk a few thousands in a newspaper property, and by the dazzling offers he made, actually induced the unconscious proprietor, unknown to his editor, (who would perhaps have told him better,) to sell the property. The moment the bargain was concluded, it was discovered, too late, that the railway company had, through the wily director, possessed themselves of the copyright of the paper, of the printing-office, and of the services of the editor. He, however, nobly refused to change his railway politics, and was accordingly dismissed, taking with him the respect both of friends and enemies. This case will readily be credited when we state that in one of the reports adverted to, it is stated that the cost of a certain railway in "buying off" opposition from land proprietors as well as editors, and in law, amounted to £1800 per mile; and that before a single rail was laid, or a spade put into the ground.

Before dismissing the four well-conducted special railway journals, and the regular stand which railway intelligence and controversy has taken in the columns of the press in general, we must not forget that the London Gazette has of late become almost a railway newspaper. By a recent act of parliament, not only notices of every projected line must be set forth, but the decisions of the government railway board concerning their expediency promulgated in that official publication. During the present session of parliament, notices for no fewer than 248 new branches or new lines have been issued, and it is no uncommon thing to see the Gazette nearly filled with them.

But of the vast masses of printing called into existence by railways, there is nothing to equal in quantity the reports of parliamentary committees—those enormous folio "blue-books," so dreadful to the visions of busy editors, but so dear to the eyes of enthusiastic statisticians. Whenever a dispute occurs concerning the expediency of having more than one line laid down between the same places, or when certain interested parties deem any railway whatever inexpedient, the controversy is referred to a "select committee of the House of Commons." These committees consist of some eight or ten members of parliament, who hear evidence on both sides, and give their decision in "reports." It often happens that weeks are employed in merely taking evidence; every word of which is accurately noted in short-hand, afterwards printed, and stitched into the well-known blue covers. Besides this, there is a report of the committee printed separately, as well as addenda, appendices, &c. Now, it happened that, in the course of the last session of parliament, between forty and fifty of these committees sat, heard evidence, reported, and—printed. Consequently, at the very least five-and-forty blue-books were issued, with their equally blue satellites, in the shape of reports, additions and appendices. Supposing we give to each of these twelve hundred and fifty pages, (a moderate average,) we may calculate that in one year railway speculation and railway opposition called into existence upwards of sixty thousand folio pages of print! And this is not all. These reports give rise to countless pamphlets, written either in reply to some of the witnesses, or for the advocacy of particular views. As regards the

utility or instructiveness of the blue-book branch of railway literature, we can only say that its chief fault is its extreme bulkiness; for much honey is to be extracted from it. Amongst the witnesses are the most eminent engineers, who furnish valuable information in answer to questions put to them; practical men of business supply lessons of sound wisdom; whilst non-professional witnesses sometimes relieve the tedium of scientific detail by the quaintness or jocularly of their replies.

From the statistical, periodical, and controversial writings which the all-powerful locomotive has created, we now turn to its historical literature. Upon this subject much has been written, and a short summary of what has already appeared we now propose to give. Railways being still in their infancy, of course their history is short.

The mere notion of lessening the draught of wheeled carriages by running them on the smooth surface of wooden or iron rails, is by no means new; such rails, in the form of grooves or ruts, for the reception of the edges of wheels, and called trams, were in use quite two centuries ago in the English collieries. Roger North, in describing the "way-leaves" granted for the privilege of laying down such roads, and of transit over them at Newcastle, says, "When men have pieces of ground between the colliery and the river, they sell *leave* to lead coals over their ground, and so dear, that the owner of a rood of ground will expect £20 per annum for this leave. The manner of the carriage is by laying rails of timber from the colliery down to the river exactly straight and parallel, and bulky carts are made with four rowlets fitting these rails, whereby the carriage is so easy, that one horse will draw down four or five chaldrons of coals, and is an immense benefit to the coal merchants."*

This practice was somewhat older than 1676, when the above passage was written. By the middle, however, of the last century, the iron works of Shropshire and Staffordshire had become sufficiently extensive to enable the Northumberland coal proprietors to substitute iron for wooden trams, and to attract the system southward. In 1760, iron plates were first laid down upon wooden rails in Colebrook Dale, Shropshire, and were speedily adopted in all the English and Welsh mines and collieries; so that by 1811 there were, in South Wales alone, above 150 miles of this description of railway. Still, the power of steam remained unapplied till the year 1813, when Mr. George Stephenson constructed the first locomotive engine. Mere theorists thought him crazed; for it was never supposed that the smooth wheels of a steam-carriage would adhere sufficiently to the equally smooth rails, so as to produce locomotion. It was thought that the wheels would run, or rather slip, round without moving the carriage; that, in short, "they would not *bite*." But George Stephenson determined to try by actual experiment. "The first locomotive which I made," said that gentleman, at a dinner given to him late last year in Newcastle, "was at Killingworth colliery, and with Lord Ravensworth's money. Yes! Lord Ravensworth and Co. were the first parties that would intrust me with money to make a locomotive engine. That engine was made 33 years ago, and we called it 'My Lord.' I said to my friends that there was no limit to the

speed of such an engine, provided the works could be made to stand." A partial failure on the Stockton and Darlington line—on which Stephenson's locomotive was tried, and which was opened in 1825, for conveying passengers by means of horse-draught—led to a temporary prejudice against his sanguine views as to amount of speed. One writer, who professed himself a friend of locomotive engines, delivered himself as follows:—"It is far from my wish to promulgate to the world that the ridiculous expectations, or rather professions, of the enthusiastic speculatist will be realized, and that we shall see engines travelling at the rate of twelve, sixteen, eighteen, twenty miles an hour. Nothing could do more harm towards their general adoption and improvement than the promulgation of such *nonsense*!"

Still Stephenson, who knew well what he was about, persisted in asserting the above "nonsense;" but it was so little heeded even by experienced men, that when, in 1828, the promoters of the Liverpool and Manchester railway employed him, and he was summoned as a witness before a committee of the House of Commons, they intreated him not to shock the common sense of the members by stating his expectations of higher speed than ten miles an hour. "When," said Mr. Stephenson, in the above-quoted speech, "I went to Liverpool to plan a line to Manchester, I pledged myself to attain a speed of ten miles an hour. I said I had no doubt the locomotive might be made to go much faster, but we had better be moderate at the beginning. The directors said I was quite right; for if, when they went to parliament, I talked of going at a greater rate than ten miles an hour, I would put a cross on the concern. It was not an easy task for me to keep the engine down to ten miles an hour; but it must be done, and I did my best. I had to place myself in that most unpleasant of all positions—the witness box of a parliamentary committee. I was not long in it, I assure you, before I began to wish for a hole to creep out at. I could not find words to satisfy either the committee or myself. Some one inquired if I were a foreigner, and another hinted that I was mad. But I put up with every rebuff, and went on with my plans, determined not to be put down. Assistance gradually increased—improvements were made every day—and to-day a train which started from London in the morning, has brought me in the afternoon to my native soil, and enabled me to take my place in this room, and see around me many faces which I have great pleasure in looking upon." Thanks to the indomitable perseverance of Stephenson in persisting in his "nonsense," there are at present nearly a hundred lines in Great Britain in full operation, not one of which is the average rate of speed less than twenty miles per hour. So much for the "ridiculous expectations of enthusiastic speculatists." From this scrap of railway history, we turn to a consideration of its light literature.

We cannot conscientiously recommend so strongly as the railway newspapers, certain other periodicals professing to be devoted to the lighter matters which float about railways, because they seem in a great measure to hoist false colors. On looking into them, we cannot perceive that they are anything more than repertoires of general facts and stray witticisms, illustrated with wood engravings. We must therefore dismiss them at once, to consider the effects which railways are

*Life of Lord Keeper Guilford, vol. i., p. 265.

gradually spreading over the current literature of the day.

Composed as a railway train is of mechanical details, and connected as it is with utilitarian maxims and doings, it possesses, we believe, some of the elements of poetry. Sink details—remove it to a distance where we only witness its force and speed, and, even as a sight, it becomes sublime. Regard it further as a recent product of man's restless ingenuity—a surprising application of physical principles to the convenience of our race, and the sublimity becomes moral. Here there surely is poetry. *Against* railways, indeed, the voice of a distinguished English poet has lately been raised. But his effusion was promptly answered by other sonneteers, who adopted the views we are now advocating. And why should it not be? The ship, with all its attributes and accessories, has for ages furnished similes for poets: who can say that, when time has sufficiently hallowed such objects, steamers and locomotives will not be equally prolific in tropes! To the novelist, a railway train is invaluable; for where can he bring his characters so unexpectedly, yet so probably together as in a double-seated carriage? His elopements may be managed with far more celerity—hence with far more excitement—by rail than by the slow-going post-chaises of the old north road; and then for a catastrophe, what would satisfy poetical justice and a melo-dramatic author so abundantly, as to crush up all his bad characters by a railway collision? We perceive that one writer has taken to the rail for his plots in right earnest. In recent numbers of the *Dublin University Magazine* appears a series entitled "Tales of the Trains, being some chapters of Railroad Romance."

We take leave of the subject by mentioning one very gratifying fact which is intimately connected with it. Some of the liberal-minded amongst the railway directories have provided for their engineers, stokers, and other employées, small and compact libraries for their amusement or instruction during the many intervals of leisure which necessarily occur. These collections of books, enclosed in a case so as to be easily removed from one station to another, form libraries always at the command of the companies' servants at the hours they most need them. Some time ago we had the pleasure of selecting such a collection at the request of the authorities of a railway near Edinburgh.

From the *Foreign Quarterly Review*.

SOCIAL ANARCHY IN FRANCE.

Du Prêtre, de la Femme, et de la Famille, par JULES MICHELET. Paris: 1845.

DURING the last four years, France has been the theatre of a passionate struggle of which few tidings have reached us here in England. It is not because the struggle was unimportant, or unworthy of European attention, but because other and political struggles which made more noise, usurped our attention, that we heard so little of the angry and profound dissension which agitated most serious minds. The struggle we allude to is that between the Jesuits and the Philosophers; and we hope to present our readers with a detailed account of it in our next.

Meanwhile, there lies before us the latest manifesto of the anti-Jesuit party—the brilliant book

of the historian Michelet—which is exciting such a sensation, that we must at once take notice of it as a separate publication. It is, indeed, a book which has an individual interest quite independent of the quarrel whence it originated. It is a book which at all times would be welcomed as a profound insight into the social life of France, but which is particularly valuable at the present time, when in our own country there is a powerful, persevering influence at work, which strives to hurry society into accepting spiritual direction and celibacy, the two monster evils of Catholicism. We speak of that active, ardent, and, if successful, terrible sect, the Puseyites. Its more recondite principles we are not now to discuss; but what it openly avows, we may openly challenge; it avows its preference for the celibacy of priests; and it avows, though less boldly, its approbation of confession and spiritual direction.

This brings the subject of M. Michelet's work home to our "business and bosoms." This makes that which is a subject of European interest a special subject of English interest. His work is full of eloquent indignation, piquant portraits, historical traits, and subtle analysis; but these are literary qualities which the majority of people would be tolerably indifferent to, did they not all combine to illustrate one strong, vehement purpose, and that purpose practical.

"The family is in question;

"That home where we would all fain repose, after so many useless efforts, so many illusions destroyed. We return home very wearied—do we find repose there?

"We must not dissimulate, we must frankly confess to ourselves the real state of things. There exists in the bosom of society—in the family circle—a serious dissension, nay, the most serious of all dissensions.

"We may talk with our mothers, our wives, or our daughters, on all those matters about which we talk with our acquaintances: on business, on the news of the day, but not at all on matters nearest the heart, on religion, on God, on the soul.

"Take the instant when you would fain find yourself united with your family in one common feeling, in the repose of the evening, round the family table; there, in your home, at your own hearth, venture to utter a word on these matters; your mother sadly shakes her head, your wife contradicts you, your daughter, although silent, disapproves. They are on one side of the table, you on the other, and alone.

"It would seem as if in the midst of them, opposite to you, sat an invisible man to contradict what you say."

Such is the mysterious opening of the work. That invisible enemy is the priest. To show how the priest becomes your enemy, and your powerful enemy, is the object of what follows. Although we entirely agree in the reasons M. Michelet alleges, and quite see the force of his arguments against celibacy, confession, and direction, as destructive to domestic peace, we think he has omitted two elements of the social anarchy, elements which marvellously facilitate the dangerous powers given to the priest by confession and direction. These, as supplementary rather than contradictory to his work, we may briefly indicate.

1st. *The husband has not the same faith as his*

wife. In France, while the girls are sedulously educated in the principles of the church, and turn out religious, often devout women, the boys, with the greater license of public schools, and the general, almost universal skepticism, or, at least, indifference in matters of religion prevalent amongst men, and apparent in every shape of French literature, are found to have no religion at all. There is very little Voltairianism in France; but there is a wide-spread indifference; no polemics, but no fervor of belief, not even fervor of disbelief. When we say France, we mean, of course, Paris; for to some of the provinces the same charge will not apply.

What is the consequence? A timid, devout, serious girl, is sold in marriage to an ambitious, occupied, or frivolous man. But the man, whether he be ambitious, over-worked, or frivolous, is sure to be indifferent to all religious matters. We repeat, *indifferent*. Were he a positive skeptic, he might convert her; and then, at least, there would be sympathy. But he does not attempt it. All her religious scruples are received with a shrug, her heart's effusions scared by a *bon mot*; her sympathies are outraged. She married without love; she is soon to be a wife without respect, as well as without love for him who ought to be her all-in-all.

But her sympathies though chilled, are not stifled; they are agitating the heart, they struggle for utterance. An English wife so situated, if not cursed with some "female friend and counselor," would soon make up her mind; keeping her thoughts to herself, praying in her own way, and praying for her husband, she would devote herself to the education of her children. There would be a "silent sorrow" in the home, as there must always be when such differences exist. But the husband would possess a wife, the children a mother, the house, a mistress. The French wife has not this refuge. The priest is at her side. To him she is bound to confide her sorrows, and how willingly does she perform the duty! To him she tells all—the secret of her soul, the secret of her home. She asks advice, and receives it; but from that moment she is lost. The priest sits at the hearth, in the place where the husband should sit. The priest has all the deepest utterances of the young heart poured into his ear; he is the only one to sympathize with her. She is *une femme incomprise*; but the priest is there ready to understand her; he is there with the most poisonous of all flattery—sympathy! He is there, unconsciously, unwillingly, the refuge for all her disappointed aspirations, all her outraged feelings. She does not love her husband; love-matches are rare in France, and the affection she could bestow on him, and which in time might ripen into love, she bestows on another.

This is no exaggerated picture; it is the inevitable result of an unhappy position. The priest is perhaps the hastener of the evil; he is not the first cause of it. If he were the first cause, why is he not so wherever Catholicism is accepted? Why not in Spain, in Italy, in Ireland? M. Michelet will not contend that the sad evil he so eloquently exposes, exists to anything like the same extent in those countries as in France; and why not? Simply, we believe, because the priest is not there so often called in to interfere. The faith of the wife is also the faith of the husband, her aspirations, if not always shared, are always understood; her deepest thoughts find an echo in

her husband's heart; what she holds sacred, he holds sacred. Upon these points, the priest is not called to interfere. He may listen to her confession, he may direct her conduct; but he has not to listen to the outpourings of a wounded spirit; he has not to soothe and flatter *la femme incomprise*.

2nd. *The mother does not nurse her infant, does not educate her child.* This point is perhaps of less importance than the former, but less than that only, and being coupled with it, becomes of fearful importance. M. Michelet has finely treated that portion of it which concerns education. It wrings from him expressions of the noblest kind; and wisely, feelingly, does he exhort the reader to pay attention to the claims of nature in this respect, and not be led away by the foolish notion of a mother's care making her son effeminate. Willingly would we transfer to our pages all the passages in which he treats of this matter; but we must be content to refer our readers—who will, we trust, all become his readers—to the work itself.

But this is not all the question. That the child is best educated by the mother, because she alone rightly understands him, when the father or the tutor so often misunderstands him, so often expects him to appreciate that which is above his comprehension—this will scarcely be denied. We mean, of course, a competent mother, not a silly, doting woman. But M. Michelet is a Frenchman, and as such, we may venture to say, is not so much alive to the importance of the mother's nursing her child, as all Englishmen are; and here we fancy he overlooks a grave consideration. Our readers are probably aware, that it is the very general custom in France for women not only to procure wet-nurses for their infants, (as many English mothers unhappily also do,) but for the infants to be sent away into the country to nurse. A serious social error. We pass over all collateral evils to dwell solely on those which immediately bear upon our present subject. The young mother is left alone! She has no husband to love; she has no child to occupy her thoughts—no child to form the centre of all her hopes, her fears, her thousand womanly affections.

Remember, the case is stronger than with the English mother, who, if she were to send her baby away from her, would (unless a young wife and mother, and to her the case does not so well apply) have other children to occupy her affections. The French are often facetious on the subject of large English families; and they little imagine how much of their own social anarchy results from their obedience to Plato's uncompromising and audacious law of proportioning the number of children to the amount of property—*οὐχ ὑπὲρ τῆς οὐσίας ποιούμενοι τοὺς παῖδας, ἀλλὰ θεομαχοὶ παντὶ ἢ πόλει*.* It is a subject we dare not dwell upon. Enough that the position of the wife and mother is an isolated one. The infant is sent away to nurse. When it returns home it is almost time for it to be sent to school. The mother is thus alone. What are her resources?

To be thus alone is to be a prey to the demon of *Ennui*. The fearful effects of that condition M. Michelet has pointed out; and in one epigram he has condensed volumes: "*Ennui* makes her receive friends she knows to be enemies—curious, envious, calumnious." If it makes such society agreeable, what charm must it not lend to the

* "De Rep." ii., p. 85, ed Bekker; confer also "Leges," v., p. 297.

society of one who feels for her, understands her, flatters her, occupies her? There are two persons who are capable of this:—a priest and a lover. How often the two are one!

The last phrase will startle many; but it was not written carelessly. The priest differs essentially from the clergyman; and it is because they differ, and because the Puseyite tendency is to make them resemble, that we feel reticence would now be cowardice. We assert, therefore, calmly, but distinctly, that the priest is but too often the lover of the woman whose conscience he directs. The thing is natural, often inevitable. M. Michelet's work abundantly proves it; and thousands of daily examples confirm his work. It is an awful fact; but its very awfulness only the more stringently forces examination of its causes.

Our readers, if personally unacquainted with French society, and drawing their notions of it from novels and vaudevilles, may imagine that every married French woman has, or will have, her lover. Indeed, to believe the novelists, love seems only possible when it is adulterous. But, although there is prodigious exaggeration in all this—although there are French homes as happy as English homes, and French wives as chaste, as fond, and as devoted as English wives, the exaggeration is the over-statement of a real truth. Adultery does exist in France to a frightful extent; and we have just named two powerful causes. The lover is accepted because he fills the "aching void" of an unoccupied heart. He is the centre of feelings which have no other centre. He takes the place of husband and children. When he is not chosen to fill that place the priest is chosen.

The priest, as confessor, possesses the secret of a woman's soul; he knows every half-formed hope, every dim desire, every thwarted feeling. The priest, as spiritual director, animates that woman with his own ideas, moves her with his own will, fashions her according to his own fancy. And this priest is doomed to celibacy. He is a man, but is bound to pluck from his heart the feelings of a man. If he is without faith, he makes desperate use of his power over those confiding in him. If he is sincerely devout, he has to struggle with his passions, and there is a perilous chance of his being defeated in that struggle. And even should he come off victorious, still the mischief done is incalculable and irreparable. The woman's virtue has been preserved but by an accident, by a power extraneous to herself. She was wax in her spiritual director's hands; she has ceased to be a *person*, and is become a *thing*.

There is something diabolical in the institution of celibacy accompanying confession. Paul Louis Courier has painted a fearful picture of the priest's position as an unmarried confessor; and as Courier's works are far less read than they deserve to be, we make no scruple of transferring his powerful sentences to our pages.

"What a life, what a condition is that of our priests! Love is forbidden them, marriage especially; women are given up to them. They may not have one of their own, and yet live familiarly with all, nay, in the confidential, intimate privacy of their hidden actions, of all their thoughts. An innocent girl first hears the priest under her mother's wing; he then calls her to him, speaks alone with her, and is the first to talk of sin to her before she can have known it. When instructed she marries; when married, he still confesses and

governs her. He has preceded the husband in her affections, and will always maintain himself in them. What she would not venture to confide to her mother, or confess to her husband, he, a priest, must know it, asks it, hears it, and yet he shall not be her lover. How could he indeed! is he not *tensured*? He hears whispered in his ear, by a young woman, her faults, passions, desires, weaknesses, receives her sighs without feeling agitated, and he is five-and-twenty!

"To confess a woman! imagine what that is. At the end of the church a species of closet or sentry-box is erected against the wall, where this priest, wise and pious as I have known some, but yet a man, and young, (they are almost all so,) awaits in the evening, after vespers, his young penitent, whom he loves, and who knows it; love cannot be concealed from the beloved person. You will stop me there: his character of priest, his education, his vow.—I reply that there is no vow which holds good, that every village *curé* just come from the seminary, healthy, robust, and vigorous, doubtless loves one of his parishioners. It cannot be otherwise, and if you contest this, I will say more still, and that is, that he loves them *all*, those at least of his own age; but he prefers one, who appears to him, if not more beautiful than the others, more modest and wiser, and whom he would marry; he would make her a virtuous, pious, wife if it were not for the pope. He sees her daily, meets her at church or elsewhere, and sitting opposite her in the winter evenings, he imbibes, imprudent man! the poison of her eyes.

"Now I ask you, when he hears that one coming the next day, and approaching the confessional, when he recognizes her footsteps and can say, 'It is she;' what is passing in the mind of the poor confessor! Honesty, duty, wise resolutions, are here of little use, without peculiarly heavenly grace. I will suppose him a saint; unable to fly, he apparently groans, sighs, recommends himself to God; but if he is only a man, he shudders, desires, and already unwillingly, without knowing it, perhaps, he hopes. She arrives, kneels down at his knees, before him whose heart leaps and palpitates. You are young, monsieur, or you have been so; between ourselves, what do you think of such a situation! Alone most of the time, and having these walls, these vaulted roofs as sole witnesses, they talk; of what? alas! of all that is not innocent. They talk, or rather murmur, in a low voice, and their lips approach each other, and their breaths mingle. This lasts for an hour or more, and is often renewed.

"Do not think I invent. This scene takes place such as I describe it, and through all France; is renewed daily by forty thousand young priests with as many young girls whom they love, because they are men, whom they confess in this manner, entirely *tête-à-tête*, and visit, because they are priests, and whom they do not marry because the pope is opposed to it."

Paul Louis might have added another argument. Forbidden fruit is proverbially of all fruit the most coveted. The very fact of man's imagination being thus stimulated by contradiction is enough to constitute temptation. What is temptation? It is the irritation of the soul, produced by the presence of an object desired, but forbidden. Were it not desired, there could be no temptation. Often there would be no desire were it not forbidden. Now it is well that men should conquer their desires; it is well that they should learn to calculate

consequences, and to forego the present enjoyment, if that enjoyment must be too dearly purchased. And such mastery all wise men possess. But, although a man may conquer one desire, although he may resist one temptation, because by an effort of the will he can rise superior to his own passions, such a state of effort is spasmodic, not normal: it may conquer once, it cannot always conquer. It is an effort; and the very nature of effort is spasmodical and temporary; it must relax, and in relaxing the man succumbs. The vehemence with which a man resists temptation is a latent cause of his fall, if the temptation continue. "When a woman hesitates she's lost;" when a man does not at once shut himself out from the possibility of a recurring temptation he is lost.

Let us take an illustration from another class. You are residing in the house of a friend whose wife is extremely fascinating. You begin to perceive that she interests you too much, and, conscious of the peril, you either put a guard upon your feelings, or, which is by far the wiser plan, you quit the house. By an effort, you have conquered. But there was only wisdom in your effort; there was no virtue; for this fascinating woman was not only another's, but had shown no signs of interest in you. This is a simple and, doubtless, common case. But now let us make it more complicated. Instead of being merely her friend, you are her confidant; and you are made the repository of all her secrets, of thoughts which neither her mother nor her husband ever know; you are revered as a superior being; your word is law; your menace terrible. She almost worships you; and you cannot leave her, cannot shun her, cannot put a stop to those confidences which torment you. In vain you struggle: you conquer to-day only to renew the fight to-morrow. The agonizing irritation of the soul named Temptation, is perpetually present. How many men are there who could withstand this?

This the priest has to suffer; and to him the peril is greater, because he is blinded by sophisms. A man in love with his friend's wife sees everything clearly enough; he knows his guilt, and shuns or braves it with open eyes. But the priest has the spiritual care of her he loves; her soul is in his hands. He is connected with her by the most sacred ties; his interest in her he disguises to himself under the cloak of spiritual anxiety. He can always quiet the voice of conscience, by an equivoque. The mystic language of love is also the mystic language of religion, and what guilt is shrouded under this equivoque, the history of priestcraft may show. *Parler l'amour c'est faire l'amour*, is a profound truth. From the love of God, it is easy to descend to the love of man; especially when this man is a priest, that is to say, a mediator between the woman and God, one who says, "God hears you through me; through me he will reply." This man, whom she has seen at the altar, and there invested with all the sacred robes and sacred associations of his office; whom she has visited in the confessional, and there laid bare her soul to him; whose visits she has received in her *boudoir*, and there submitted to his direction, this man whom she worships, is supposed to be an idea, a priest; no one supposing him to be a man, with a man's passions!

M. Michelet's book contains the proofs of what we have just said; but they are too numerous to

quote. We shall only borrow from his work the passages he gives from an unexceptionable authority, Llorente:

"Llorente, a contemporary, relates (t. iii., ch. 28, article 2, ed. 1817,) that when he was secretary to the Inquisition, a capuchin was brought before that tribunal, who directed a community of *déguines*, and had seduced almost all of them, by persuading them they were not leaving the road to perfection. He told each of them in the confessional that he had received from God a singular favor: 'Our Lord,' he said, 'has deigned to show himself to me in the sacrament, and has said to me: Almost all the souls that thou dost direct here, are pleasing to me, but especially such a one (*the capuchin named her to whom he spoke.*) She is already so perfect, that she has conquered every passion, except carnal desire, which torments her very much. Therefore, wishing virtue to have its reward, and that she should serve me tranquilly, I charge thee to give her a dispensation, but only to be made use of with thee; she need speak of it to no confessor; that would be useless, as with such a dispensation she cannot sin.' Out of seventeen *déguines* of which the community was composed, the intrepid capuchin gave the dispensation to thirteen, who were discreet for some length of time: one of them, however, fell ill, expected to die, and discovered everything, declaring that she had never been able to believe in the dispensation, but that she had profited by it.

"I remember," says Llorente, "having said to him: 'But, father, is it not astonishing that this singular virtue should have belonged exactly to the thirteen young and handsome ones, and not at all to the other four, who were ugly or old?' He coolly replied, 'The Holy Spirit inspires where it listeth.'"

"The same author in the same chapter, while reproaching the Protestants with having exaggerated the corruption of confessors, avows that: 'In the sixteenth century, the Inquisition had imposed on women the obligation of denouncing guilty confessors, but the denunciations were so numerous, that the penitents were declared dispensed from denouncing.'"

It is painful thus to drag to light the iniquities which have sullied the past; but our arguments would be suspected of gross exaggeration, were they not in some measure supported by these historical facts; and although we are as unwilling as any one, to hold a body of men responsible for the acts of their predecessors, we are surely keeping within the legitimate bounds of argument, in thus pointing out the *results* of an institution; results which we hold to be inherent in the very nature of that institution. We may as well anticipate an objection which is sure to be made. It will be said that the picture we have drawn of the priest and the wife is not a fair one, because it is not true of all priests and all wives; it is an exception, and not to be treated as the rule.

We accept this objection, and admit that the case we have considered does not apply to all wives. Let us explain, however. In the case we have considered, we assumed the wife to be truly religious, to have married a man she does not love, and who does not share her faith, and to have no children at home with her. This we say is the common, though not universal, position of French wives; and wherever it exists, the consequences we have pointed out will certainly follow. But the wife is not religious! In that case she would

not be in danger from the priest; but in that case the evils of the institution of priesthood would not have a trial. We say that celibacy, confession, and direction, have an almost inevitable tendency to convert the priest into a lover. This being the point we wish to illustrate, we are right in selecting only such cases as admit of the natural operation of this tendency. It would be no argument against the purity of a clergyman's doctrine and example, that several persons who never entered his church, and never paid attention to his acts, were notoriously dissolute and profane. In the same way, it is no argument against the danger of priesthood, that those persons who have no religion, or who seldom come in contact with the priests, are entirely free from the evil effects which are found to follow in other cases. If there is a real vice in the institution, it will best display itself where the surrounding circumstances are most favorable to its free operation: that is, in convents, and in families such as we have described.

M. Michelet says, that the priest is the cause of the social disunion; and to show how he is the cause, the book was written. He is the cause, because he possesses the wife, possesses her soul as a confessor, directs it as a director. He is the real master of the house. Old Selden long ago saw the nature of the priestly tactics. "When the priests come into a family," he says, "they do as a man that would set fire on a house; he does not put fire to the brick wall, but thrusts it into the thatch. They work upon the women, and let the men alone." And have we not had experience enough of the truth of this in our own country! Are not the Cantwells and the Stigginses abundant? Do we not find the essence of "direction," if not its name, among certain classes of religionists professing the strongest antipathy to Romanism? It were a serious error to suppose, that M. Michelet is only fighting against an evil endured by France. He fights against an evil which we are all bound to take arms against, because it more or less openly menaces us all. Wherever the priest departs from the strict nature of his office, interferes with temporal matters, and with the private concerns of family life, and makes himself privy keeper of the several consciences of his flock, there direction exists to all intents and purposes.

Having thus endeavored to point out the dangerous tendencies of direction, especially when accompanied by celibacy, we may now proceed to give an account of the book in which M. Michelet has so brilliantly exposed them: an account we would gladly enrich with piquant extracts, but that our space forbids it.

It is divided into three parts. The first is an historical appreciation of direction and its theories in the seventeenth century. This is touched in his own masterly manner. All the brilliant qualities of the historian assist him here; and exquisite are the pictures he paints of Saint François de Sales and Madame de Chantal, of Bossuet and la Sœur Cornuau, of Fénelon and Madame de la Maison Fort, and of Madame Guyon. Beside these portraits are little cabinet pictures of the inner life of much of the seventeenth century; and *La Dévotion Aisée*, and *La Dévotion Galante*, let us into the secret of the times. Contrasted with these cabinet pictures, there are some of those ghastly subjects worthy of the pencils of Rebyra and Francia; we speak of Molinos—the society of Le Sacré Cœur—la mère Agueda et Marie Alacoque.

The second part is devoted to an appreciation of direction in the nineteenth century. In this Michelet examines, in detail, the whole question of direction; the means by which the priest acquires his power, and the ends for which he uses it. This second part we have made use of in the foregoing pages, but the reader will find it a far more satisfactory exposition. It contains, moreover, a fearful exposure of the convent system; in the course of which he refers to Eugène Sue's "Juif Errant," the third volume of which contains the real history of Mademoiselle B. "It took place recently," says M. Michelet, "but in a convent, not in a mad-house."

The third part is devoted to a brief consideration of the Family: a subject we have already touched upon. From this brief outline, our readers will gather an idea of the extent and variety of the subject treated; and when we add, that it is treated by M. Michelet, we have said enough to excite the most eager curiosity.

From Chambers' Edinburgh Journal.

JOHN JOACHIM WINCKELMANN.

JOHN JOACHIM WINCKELMANN, the celebrated historian of ancient art, was born on the 9th of December, 1717, at Stendal, a town of Prussia, about eighty miles from Berlin. His father belonged to almost the lowest rank of life, being in fact a cobbler, struggling not only with poverty but with disease, which, at an early period of Winckelmann's life, forced him to take refuge in an hospital. As the boy grew up, he showed great anxiety to go to school; but his parents were unwilling to lose even his trifling services, and it was not without much difficulty that he at last persuaded them to send him to the burgh seminary. Once there, the rector, Esaias Wilhelm Tappert, a very worthy man, was struck with his dawning genius and earnest perseverance. He offered to instruct him for less than the usual fee, and by procuring him at the same time admission into the choir, enabled him, without drawing on his father's scanty resources, to remain at school. Young Winckelmann proved the most apt and diligent of scholars; he seldom joined in the sports of his companions: generally, when they were playing, he might be seen conning some difficult passage of a classic, or learning by heart from a manuscript before him long lists of Greek and Latin words. With his industry and fine faculties he made such progress, that Tappert promoted him, while quite a stripling, to the rank of usher; some also of the Stendal burghers employed him in giving private lessons to their children; and with the trifling gains thus acquired, Winckelmann began to find himself contributing to the support of his parents.

In time, a closer intimacy sprang up between the rector and his young protégé. Tappert lost his eyesight, and the other became his daily visitor, read to him, wrote for him, and tried in a thousand ways to cheer his solitary hours. The chief want of Winckelmann, as of every poor student, that of books, was now supplied. He had free access to his patron's well-chosen library, and he read with avidity Homer, the Greek dramatists, and works on archaeology and history. Meanwhile he was giving indications of something rarer than even an industrious and affectionate disposition. He wished to travel, he used to say, when quite a child;

above all, he longed to visit Egypt, that he might behold the pyramids. His innate love for objects of art began also to display itself, as well as it could in a place so sequestered as Stendal. Long after, when the poor cobbler's son had become a famous man, his companions remembered how he incited them, by the hope of some petty reward, to search the surrounding country for antiquarian remains; and, so recently as 1821, two Roman urns were to be seen in the library of the Stendal school, which were exhibited with pride as the product of one of these excursions.

When he had reached his seventeenth year, the kind Tappert despatched him to Berlin, with a letter of introduction to the rector of a gymnasium there, under whose roof he remained for a twelvemonth, alternately instructing and instructed. He was then recalled to Stendal, where his friend the rector placed him at the head of the choir. He spent the next four years in unremitting study, endeavoring at the same time to support himself and assist his family by teaching in public and in private. We have no detailed account of his life during this period. One anecdote only remains, which relates to his residence in Berlin, and deserves to be repeated as a pleasing illustration of his youthful enthusiasm. He had heard, it is said, that the library of the celebrated Fabricius was about to be sold at Hamburg, and he determined to proceed there on foot and be present at the sale. He set out accordingly, asking charity (a common practice with poor German students in their rambles, and not considered disgraceful) of the clergymen whose houses he passed on the road; and having collected in this way a little sum, he purchased on his arrival some of his darling poets, and returned to Berlin overjoyed with his success.

Winckelmann was now twenty-one, and it was quite time for him to choose a profession. His Stendal friends thought him fitted for the church, and they sent him to obtain the necessary qualifications at the university of Halle. He had no special inclination towards theology, but he obeyed in silence, and applied himself to it with his usual ardor. At Halle he had access to public libraries, and his studies seem to have been of the most miscellaneous kind, ranging from Homer and the higher mathematics, to medicine and the ponderous tomes of the feudal lawyers. At the end of two years he abandoned theology, probably because the help from home began to fail him. He remained at Halle for six months longer, arranging the library of one of the academic authorities; and then, with the small sum that he received for this, found himself thrown friendless upon the world. He was too poor to enter any profession, and a thousand vague wishes began to agitate his breast. His love of study had been confirmed into a habit: the magnificent gallery at Dresden, to which, on the occasion of some festivities, he had paid a flying visit, was ever before his eyes, and he resolved to devote his life to literature and art. Meanwhile his early passion for wandering revived, and he now put in execution a scheme which savors of less wisdom than might have been expected from a youth of twenty-three, who had seen something of the world. Fascinated with a fresh perusal of Cæsar's Commentaries, he began, in the summer of 1740, a pedestrian journey to France, solely, his biographers assure us, to visit the scene of the great Roman's military exploits. As is usual in such cases, his funds were speedily exhausted; and when near Frankfort-on-the-

Maine, he was compelled to retrace his steps. The most laughable part of the story remains to be told. Arriving at the bridge of Fulda, he remarked his own dishevelled, travel-stained appearance, and fancying no one near, resolved to remedy it. He had pulled out a razor, and was about to operate on his chin, when he heard a noise, and turning round, perceived a party of ladies, who, thinking him on the point of committing suicide, were shouting for help. The truth, however, was speedily explained, and the fair intruders, it is added, generously forced on his acceptance a gift of money sufficient for him to pursue his retreat in comfort.

Poor Winckelmann now discovered that life was made of sterner stuff than such romantic dreams. He went to Jena, and there, besides mastering Italian and English, struggled hard to complete his knowledge of medicine, with a view to making it a profession. But this scheme also, after a few months, poverty compelled him to forego. He became tutor in a family at Heimersleben, and during the year and a half which he spent there, devoted his leisure to historical studies, reading, we are informed, Bayle's dictionary twice through. At last the conrectorship of the school at Seehausen was offered him, with a yearly salary of 250 thalers, little more than 3*l*. Small as this was, it was a larger income than he had ever enjoyed: it enabled him to send something to his infirm and aged parents; accordingly, he accepted the post with joy, and in the autumn of 1743 we find him installed at Seehausen.

During no period of his life does Winckelmann appear more deserving of our regard than in the years of obscure drudgery which he passed at Seehausen. He found, on his arrival, none of his scholars acquainted with more than the first rudiments of Latin and Greek; many were ignorant of their ABC; and the poorer ones could obtain no money from their parents for the purchase of the necessary school-books. Thus, in spite of his title of conrector, Winckelmann had little scope for the display of his fine genius and deep erudition. But nothing daunted, nothing discouraged him. He made, with his own hand, copies of such passages in the classical authors as his scholars became qualified to read, and these he distributed among them. He labored and labored, until at last things began to wear a flourishing aspect. Beyond the sphere, too, of his immediate duties, he found time both for his own intellectual improvement and for the indulgence of his kindly disposition. After school, he gave a few private lessons. In the evening, a favorite pupil, whom he instructed in philosophy and mathematics, remained till ten. Then Winckelmann belouged to himself. Seizing his Sophocles, (a favorite author, of whom he was projecting a new edition,) he read and annotated till midnight. When twelve struck, he never dreamt of going to bed, but, wrapping himself closely in an old fur cloak, leant back in his chair, and slept among his books till four. He then renewed his own studies for two hours more; at six the favorite pupil returned, and stayed until it was time to open school. Few scholars of Winckelmann's eminence have had, during the early portion of their career, so little leisure for private study; none ever turned that little to better account.

Five years of this laborious existence did not impair Winckelmann's health of body or cheerfulness of mind. He was modest and wise enough to be content with his situation, and might have

remained all his life at Seehausen, had not some vexatious interference on the part of the school-inspector forced him reluctantly to leave it. After resolving on this step, he made several unsuccessful attempts to procure employment, and had finally made up his mind to betake himself to London, where, with his knowledge of languages, he hoped easily to obtain a situation as corrector of the press. Happily, during a brief visit to Dresden, in the June of 1748, he heard some one mention the vast collection of books which the Count Von Bünau, at his estate of Nöthenitz, near Dresden, was then amassing and arranging. He penned immediately a modest letter to that nobleman, imploring the most trifling literary engagement. The count inquired into his character and accomplishments, was pleased with both, and offered his petitioner a subordinate post in his library, with a yearly salary of 12*l*.! Winckelmann accepted the offer, received the money for his travelling expenses, hurried to Stendal, taking with him all the books he had through life painfully collected, commissioned a friend to sell them, and apply the proceeds in a weekly allowance to his father, to whom he bade farewell, and then proceeded, light of heart, to Nöthenitz.

The count was engaged in the composition of a history of the German empire, and Winckelmann's principal employment at Nöthenitz was to make such copies of, and extracts from, old documents as were to find a place in that work. He acquitted himself altogether to the satisfaction of his employer; nay, at first he labored with such assiduity that his hair became gray: we do not find, however, that he received any more solid encouragement from his excellency than praises and kind words. Nevertheless, with board and lodging provided him, and a little leisure on his hands, Winckelmann was for some time tolerably happy. He had a noble library at his command; from time to time he made excursions to Dresden, where he could converse with such men as Hagedorn and Oeser; and, still better, range at will through its picture-gallery and collection of antiquities. At last, what with the laborious fulfilment of his duties and the intensity of his private studies, even his Herculean strength gave way; his health grew daily worse; his drooping gait and emaciated frame betokened the approach of death; and his friends advised him, if he wished to live, at once to seek a warmer climate. Meanwhile (in the spring of 1751) Archinto, the papal nuncio at Dresden, came to Nöthenitz, and made, during his stay there, Winckelmann's acquaintance. He was charmed with his learning and exquisite taste, and, observing his debility, strongly recommended him to go to Italy. "That," cried Winckelmann, "is the goal of all my wishes." The nuncio begged him to pay him a visit at Dresden. There he introduced him to Father Rauch, the confessor of the king; and both hinted, among other things, that Winckelmann, by becoming a Catholic, might obtain a pension from the court of Dresden, and thus repair to Italy. Hints soon became persuasions: after long wavering, in an evil hour Winckelmann consented, and on the 11th of July, 1754, abjured Lutheranism to enter the pale of the Romish church. Such changes, when they proceed from conviction, can never deserve to be visited with reprobation; but in this case, the most friendly of Winckelmann's biographers admit far other motives were at work. We learn with pleasure, that at the moment he was severely punished by the estrangement of his very dearest

friends. At the same time, the Count Von Bünau must not escape uncensured. Even the tolerant and aristocratic Goethe is indignant at his niggardly neglect: the acquisition of a book-rarity the less, nay, a simple application from a minister of his influence to the court of Dresden, would have furnished the slender aid which Winckelmann purchased at so dear a rate.

His excellency contented himself with being very angry, and Winckelmann was soon of course forced to quit Nöthenitz. He repaired to Dresden; and here he found himself moneyless as ever: Archinto was in Italy, and Rauch, though very polite, kept his hand closed. Meanwhile, Winckelmann (narrowly escaping starvation) projected, drew, wrote, and studied—the last generally in the Brühl library, where Heyne was then employed. "It is a curious fact," remarks Mr. Carlyle, in his notice of the latter,* "that these two men, so singularly correspondent in their early sufferings, and subsequently distinction, line of study, and rugged enthusiasm of character, were at one time, while both as yet were under the horizon, brought into partial contact. 'An acquaintance of another sort,' says Heeren, 'the young Heyne was to make in the Brühl library, with a person whose importance he could not then anticipate. One frequent visitor of this establishment was a certain almost wholly unknown man, whose visits could not be specially desirable for the librarians, such endless labor did he cost them. He seemed insatiable in reading, and called for so many books, that his reception there grew rather of the coolest. It was John Winckelmann. Meditating his journey for Italy, he was then laying in preparations for it. Thus did these two men become, if not confidential, yet acquainted; who at that time, both still in darkness and poverty, could little suppose that in a few years they were to be the teachers of cultivated Europe, and the ornaments of their nation.'" For Winckelmann, both the "darkness" and the "poverty" were soon to be at an end. He found means, in the May of 1755, to publish his first book, the "Reflections on Imitation of the Greeks in Painting and Statuary," which was dedicated to the king, and brought its author high and sudden fame. A month or two afterwards, he received the promise of an annual pension of 30*l*.; Rauch sent eighty ducats for travelling expenses; and in the following October Winckelmann, now about to enter his thirty-ninth year, found himself at last in Rome.

It is not our intention to detail with the same minuteness the remaining thirteen years of Winckelmann's life, years of almost uninterrupted happiness. In Rome his health was completely restored; he needed little for the supply of his bodily wants, and that little he always obtained without difficulty. When his pension ceased, on the death, in 1759, of his patron Archinto, the Cardinal Albani invited him to become keeper of his collections, with an ample salary, and merely nominal duties. He was appointed by the Pope, in 1763, Antiquario della Camera Apostolica, or Superintendent of the Antiquities of Rome, an honorable post, congenial to his tastes. He lived on a familiar footing with the great and opulent; the most eminent of the artists resident in Rome were his daily companions; he had free access to the noblest collections of art in the world; and in the purest intellectual enjoyment and effort, he speedily forgot his past sufferings and struggles. Every

* *Miscellanies*, vol. ii., pp. 42-3.

foreigner of distinction who visited the Eternal City was proud to have Winckelmann for a cicerone: he himself delighted, when he found rank and genuine taste combined, to act in that capacity, and his conversation on such occasions was of the most brilliant and fascinating kind. The thoughts and emotions which were excited in him by the beautiful remains of antiquity, found moreover enduring expression in a long series of masterly writings. The principal of these, his *History of Ancient Art*, was begun in the second year of his residence at Rome, and published at Dresden in 1764.

The publication of this work raised him to the pinnacle of European celebrity, and more than one German potentate (the great Frederick among the rest) endeavored, without success, to tempt Winckelmann to his court. His friends in Germany, however, prevailed upon him, in 1768, to pay them a visit; and, in the company of a Roman sculptor named Cavaceppi, he set out for his native country in the April of that year. But as the distance increased between him and his beloved Rome, he sank into a deep melancholy: when they were crossing the Tyrolean Alps, he pointed to the gloomy sky overhead, and exclaimed, "Torniamo a Roma," (Let us return to Rome.) Cavaceppi persuaded him to continue his journey, and they reached Ratisbon, where the Empress-Queen, Maria Theresa, was then residing. Winckelmann now resolved to go no further. The Austrian prime minister, Kaunitz, himself joined his expostulations to those of Cavaceppi in vain. He remained at Ratisbon till the end of May, and having been presented to the empress, who bestowed on him some costly medals in proof of her regard, proceeded to Trieste, were (preserving, we know not why, a strict incognito) he took an apartment in a hotel, purposing to sail to Italy in the first ship bound for Ancona.

He met at the common dining-table of the hotel an Italian stranger named Francesco Arcangeli, who, it afterwards appeared, had been banished for theft from the Austrian dominions. This scoundrel easily gained his confidence, by introducing him to the captain of a ship bound for Ancona, and by an agreeable and winning manner. The unsuspecting Winckelmann told him everything about himself except his name, and showed him the presents of the empress; these excited the Italian's cupidity. On Wednesday, the 8th of June, Arcangeli left the hotel early in the morning, and having made some purchases, returned to his room, where he remained for some time, and then (as he was daily in the habit of doing) paid a visit to Winckelmann in his apartment. The latter was sitting, without neck-cloth or upper garment, at his writing-table, on which, as it chanced, there lay unfinished his literary testament. He rose to greet his guest, and they walked together up and down the room till ten, talking of his approaching departure. Winckelmann was in the gayest humor, spoke with enthusiasm of his patron Albani's splendid villa, and begged the other to come and visit him at Rome. Suddenly Arcangeli asked him to show the company at dinner that day the empress' medals. He refused. "Will you tell me, then, what your name is?" "No; I do not wish to be recognized," was Winckelmann's reply; and, offended with the abruptness of the questions, he sat down, with his back towards the Italian, and began to write. Arcangeli immediately took from his pocket, and threw over Winckelmann's head, a knotted cord, which, as he started up,

tightened round his throat. They closed, and had struggled together for a short time, when Arcangeli drew a knife and plunged it into his victim. At this moment a servant, hearing the noise, rushed up and opened the door, through which Arcangeli escaped unpursued. It is needless to protract the catastrophe. Physicians were summoned; but all was vain; and at four in the afternoon Winckelmann expired. The assassin was some weeks afterwards captured, tried, and executed.

The news of this unexpected, mysterious, and melancholy death, was received with regret throughout all Europe, especially in Germany, where many of his admirers (the youthful Goethe among the number) were ignorant of Winckelmann's abrupt return towards Italy, and were preparing to welcome him with enthusiasm. We have left ourselves no room to speak of his works: his biography is now before the reader. We wish that Winckelmann, by avoiding the fatal error of apostasy, had allowed us to say that his was a life altogether worthy of a scholar and a man.

From Hood's Magazine.

THE HERRING PIE.

It was a cold winter's evening: the rich banker Brounker had drawn his easy chair close into the corner of the stove, and sat smoking his long clay pipe with great complacency, while his intimate friend, Van Grote, employed in exactly the same manner, occupied the opposite corner. All was quiet in the house, for Brounker's wife and children were gone to a masked ball, and, secure from fear of interruption, the two friends indulged in a confidential conversation.

"I cannot think," said Van Grote, "why you should refuse your consent to the marriage. Berkenrode can give his daughter a good fortune, and you say that your son is desperately in love with her."

"I don't object to it," said Brounker. "It is my wife who will not hear of it."

"And what reason has she for refusing?"

"One which I cannot tell you," said his friend, sinking his voice.

"Oh! a mystery.—Come, out with it. You know I have always been frank and open with you, even to giving you my opinion of your absurd jealousy of your wife."

"Jealous of my wife? nonsense! Have I not just sent her to a masked ball?"

"I don't wonder you boast of it. I should like to have seen you do as much when you were first married. To be sure, you had reason to look sharply after her, for she was the prettiest woman in Amsterdam. Unfortunately, she has taken such advantage of your love, that the grey mare has become the better horse, and you refuse an advantageous match for your son, to gratify her caprice."

"You are quite wrong, my good friend. I never allow any one to be master here but myself; and in the present instance I cannot blame Clotilda. The secret of her refusal lies in a herring pie."

"A herring pie!" exclaimed Van Grote.

"Yes, a herring pie. You may remember it was a favorite dainty of mine, and that my wife could not endure even the smell of it. Well, during the first years of my marriage, I must confess that I was a little—a very little—jealous of Clotilda. My situation obliged me to keep open house, and among the young sparks who visited

us, none gave me so much uneasiness as the handsome Colonel Berkenrode. The reputation that he had already acquired for gallantry was enough to create alarm, and the marked attention he paid my wife convinced me it was well founded. What could I do? It was impossible to forbid him the house, for he had it in his power to deprive me of the government contracts; in other words, to ruin me. After pondering deeply on the subject, I decided on doing nothing, until the danger should become imminent; all that was necessary was to know how things really stood. Having just purchased this house, I caused a secret closet to be made behind the stove here. It communicates with my private room, and from it I could overhear everything that passed in this apartment without risk of being discovered. Thank God I have had no use for it for the last twenty years, and, indeed, I do not even know what has become of the key. Satisfied with this precaution, I did not hesitate to leave Clotilda when any of her admirers paid her a visit, though I promise you that some of the colonel's gallant speeches made me wince."

"Upon my word," interrupted his friend, "you showed a most commendable patience. In your place I should have contented myself with forbidding my wife to receive his visits."

"There spoke the old bachelor. But as I did not want to drive her headlong into his arms, I went a different way to work. Day after day I was forced to listen to the insidious arguments of the seducer. My wife—I must own she made a stout defence—at one time tried ridicule, at another entreaty, to deter him from his pursuit of her. He began to lose hope in proportion as I gained it, till one day he bethought himself of threatening to blow out his brains if she would not show him some compassion. Moved at this proof of the strength of his passion, she burst into tears, and pleaded that she was not free—in short, she gave him to understand that I was the obstacle to his happiness. Berkenrode was too well skilled in the art of seduction not to see that he had gained a point. He raved, cursed me as the cause of his misery, and tried to obtain a promise from her in case she should become a widow. She stopped him peremptorily; but I never closed an eye that night, and Clotilda, though she did not know that I watched her, was as uneasy as myself. On the following day a circumstance occurred that increased her agitation. While at breakfast, a message came from the cook asking to see me alone. I desired him to come in (as I was not in the habit of interfering in domestic affairs) and communicate his business in my wife's presence. When the man entered he was as pale as a ghost, and scarcely seemed to know what he was about. At last he told me that he had received a packet containing a small bottle, three hundred guildens, and a note, in which he was requested to put the contents of the former into the first herring pie he should prepare for me. He was assured that he might do so without fear, as the contents of the bottle were quite harmless, and would give a delicious flavor to the pie. An additional reward was promised if he complied with the request and kept his own counsel. The honest fellow, who was much attached to me, said he was convinced there must be something wrong in the affair, and should not be happy till bottle and money were out of his hands. I poured a few drops of the liquid on a lump of sugar, and gave it to my wife's lap-dog. It fell into convulsions, and died in a

few minutes. The case was now plain; there had been an attempt to poison me. Never shall I forget Clotilda's pale face as she threw herself weeping into my arms—"Poison! A murderer!" she exclaimed, clasping me as if to shield me from danger; "Merciful Heaven, protect us both!" I consoled her with the assurance that I was thankful to my unknown enemy, who was the means of showing me how much she loved me. That day Berkenrode came at the usual hour; but in vain did I take my seat in my hiding-place, he was not admitted. I afterwards found that she had sent him a letter, threatening if ever he came again that her husband should be informed of all that had passed. He made many attempts to soften her resolution, but to no purpose, and a year afterwards he married. No acquaintance has ever existed between the families; and now you know why my wife refuses her consent to our son's marriage with Berkenrode's daughter."

"I cannot blame her," said Van Grote. "Who would have thought that Berkenrode, a soldier, and a man of honor, could have been capable of such a rascally deed?"

"Ha! ha! ha!" laughed Brounker; "and do you really think it was the general who sent the poison?"

"Why, who else?"

"Myself, to be sure! The whole was my own contrivance, and it cost me three hundred guildens in a present to my cook; but it was money well laid out, for I saved my wife, and got rid of her troublesome lap-dog at the same time."

"Do you know, Brounker, I think it was rather a shabby trick to leave Berkenrode under such an imputation; and now that your son's happiness depends on your wife's being undeceived—"

"I am aware of all that, but to undeceive her now is not so easy as you think. How can I expect her to disbelieve a circumstance in which for the last twenty years she has put implicit faith?"

He was interrupted by the entrance of Vrow Brounker. Her cheeks were flushed, and she saluted Van Grote rather stiffly.

"What! not at the ball, Clotilda?" asked her husband.

"No! I had a bad headache," she replied, "and Maurice has promised to take charge of his sisters. But I have come to tell you that I have been thinking over his marriage with Mina Berkenrode, and have altered my mind on that subject. In short, I shall withdraw my opposition to the match."

The friends looked at each other in astonishment.

"By the bye," she continued, "here is a key I found some time ago; I think it must belong to you."

"Well, Clotilda," said her husband, striving to hide his confusion as he took the key, "this is good news about the marriage—"

"Suppose you and your friend celebrate it by a supper. There is a herring pie in the house, and you need not fear that it is poisoned."

She left the room. Brounker looked foolish, and Van Grote rubbed his hands as he exclaimed, "Caught in your own trap! He who digs a pit for his enemy shall fall into it himself."

"Nevertheless," replied Brounker, "I think I have got well out of mine."

CORRESPONDENCE.

IN one of our numbers we gave great praise to the new president, Mr. Polk, for being able to keep his own counsel—to rule his tongue. The late arrivals from England show that much trouble has arisen from his not persevering in this difficult struggle. In his inaugural address, he announced our title to the "country of the Oregon," as clear and unquestionable—and talked of the march of the American farmers, with their wives and children, to take possession of it. Now he perhaps meant to commit himself to England only so far as to *some* country connected with the *river* Oregon—while *here*, his phrase might be understood, by the rank and file, as meant to cover the whole ground of the dispute. And so the agricultural process and settlement (which are entirely in accordance with the treaty) might appear as the actual seizing of the debatable land—thus giving another text for popular vainglory.

But Sir Robert Peel has ably, adroitly, and we must acknowledge *fairly*, made use of the opportunity (supported by the whig opposition and the whole house) to animadvert upon the unusual course of the president, in thus apparently taking the ground that we will not submit anything to the negotiation which was said to be pending in a very amicable spirit. We are thus placed in the wrong, very plausibly, before the British nation, and the public opinion of Europe. Not, it is true, upon the main question—but *that* is damaged by this blunder.

The Britannia thus notices the subject:

THE question of the Oregon territory came under discussion in both houses of parliament on the 4th April. The language of ministers was firm, but cautious. The inaugural address of President Polk drew from Sir Robert Peel some strong expressions of condemnation; and, in reference to the assertion that the United States had "a clear

and unquestionable right" to the Oregon territory, the premier stated that this country had rights, and that, though he hoped for a pacific solution of the question, they should, if necessary, be firmly maintained. This language drew forth loud cheers from all parts of the house.

We have reason to believe that, however amicable in tone might be the negotiations of our government with President Tyler's cabinet, a matter of some difficulty was in discussion before Mr. Polk assumed office. The letter of Mr. Calhoun to the States' minister at Paris had excited the attention of our government, which had demanded the retraction and disavowal of the offensive document. It is probably from that question remaining unsettled, as well as from the unusual language of Mr. Polk, that ministers last night felt it necessary to hint that they were prepared for any alternative rather than disgraceful concession.

We believe that our government, without giving any just cause of alarm, is not confining itself to declarations merely. Urgent instructions have been forwarded to the governors of all our North American dependencies to keep themselves prepared for every emergency; and two additional companies of Royal Artillery are under orders for embarkation for Canada. The augmentation is small, yet the time at which it is made, the particular arm from which it is selected, and the fact that it is intended as a *reinforcement* and not as a relief, give it a degree of significance that might not otherwise attach to it.

In connection with this subject, we may mention the very unexpected detention at Liverpool of the Halifax steam-packet *Caledonia*, by orders from the Admiralty. This unlooked-for delay of at least thirty-six hours was yesterday the subject of much comment and conjecture in the city. The generally received explanation was, that it was done in order to give the government the opportunity of awaiting the result of the parliamentary discussions of last night on the Oregon question.

We may expect that the intelligence it will carry will cause a great sensation in America. Our ministers have at last spoken out, and the answer to their declarations of last night will

naturally be looked for with much anxiety. In plain words they say to President Polk, "We will not allow you to decide this question as you please. Your bluster does not frighten us. The points in dispute shall be settled by negotiation on principles of reason, not by the mere assertion of an inexperienced man whom chance has elevated to the first office of the American republic."

It seems very probable that the majority in favor of the Maynooth grant, on the division which took place on the 3d of April, was swelled by the premier's reference to the necessity of conciliating Ireland, in the crisis of this American demonstration.

How much better had it been had we followed Mr. Calhoun's counsel of "wise and masterly inactivity."

The arrivals of English papers up to the middle of April show a most violent and general opposition to the increased and permanent endowment of Maynooth. It is opposed as the beginning of a course of measures intended to take the whole support of the Romish clergy in Ireland into the hands of the British government. There seems no doubt of such intention, which is supported by the whigs, and is so very disagreeable to the conservatives, that although pressed by the whole power of ministerial patronage, half of them vote against it.

It is supported by Mr. Gladstone, who has thus forever forfeited the confidence of his *political* party.

We presume that nothing can be brought to bear upon the question sufficiently strong to overcome the determination of the present ministry, backed by the whigs, who only could be brought into their places. The battle will be fought before the Protestant forces can be gathered into array.

The Right of Search is to be suspended for two years:—this removes one of the grounds upon which we might hope for a French diversion in case of war. A war, while arbitration is open to us, would seem to be impossible, and would never be thought of except as a means of accomplishing political schemes and personal objects at home.

BOOKS RECEIVED.

From Harper & Brothers, New York.

No. 2, of the very useful *ENCYCLOPEDIA OF DOMESTIC ECONOMY*.

Nos. 49, 50, of the *ILLUMINATED SHAKSPEARE*.

A System of *LATIN VERSIFICATION*. By CHARLES ANTHON, LL.D.

From D. Appleton & Co., New York—and for sale by Haliburton & Dudley, Boston.

HISTORY OF GERMANY, from the Earliest Period

to the Present Time. By Fred. Kohfransch. Translated from the German by James D. Haas.

The author is Chief of the Board of Education for the kingdom of Hanover—and this work is said to have been popular for 30 years, and to have become a standard work in the continental universities. This American edition is handsomely printed, upon type and paper suited to its historical dignity. We have Parts 1, 2, and 3, and the whole will be complete in five parts.

We observe that it is to be a part of a Historical Library, to be issued by the same publishers, who appear to be desirous of doing good to the public, while they profitably conduct their large business.

NEVER TOO LATE. By Charles Burdett.

This story is intended to teach the lesson that the offer of Divine mercy is not withdrawn from those who turn to it, however tardy and undeserving.

From William D. Ticknor & Co., Boston.

ORTHOLOGY; OR VOCAL CULTURE IN ELOCUTION; a Manual of Elementary Exercises, adapted to Dr. Rush's Philosophy of the Human Voice, and designed as an introduction to Russell's American Elocutionist. By James E. Murdoch and William Russell. With an appendix containing directions for the Cultivation of Pure Tone, by G. J. Webb.

The principles of Dr. Rush's book (which has been so well received in England as well as at home) are here reduced to practice. The book contains engravings of the organs of voice. This is a subject which concerns not only every public speaker, or private reader, but every one who wishes to have a pleasant voice.

From Saxton & Kelt, Boston.

THE GERMAN'S TALE, KRUITZNER, by Miss Harriet Lee. Lord Byron's praise of this tale gave it a new vogue some 20 years ago. This is a very neat pocket edition.

TRIALS OF MARGARET LYNSDAY, by Professor Wilson. Having read this two years ago, we can only now look at the type and paper which are good, and recommend it to the young people.

From E. H. Pease & W. C. Little, Albany.

THE MONTHLY ROSE. A periodical sustained by the present and former members of the Albany Female Academy.

We have seen in the newspapers some very sweet poetry credited to the *Monthly Rose*, and are glad to know where it blooms.

CHRISTIAN WORLD. Philadelphia.

This is the first quarterly number of the fifth volume of the work, conducted by the Rev. Thomas H. Stockton. A very material part of the mission of this gentleman, is to unite all Christian people in a religious and benevolent association for the improvement of the press, so as to bring about a harmony in life and doctrine. Mr. Stockton is of the Protestant Methodist denomination, but cares little for any of the points which divide those who "love Christ in sincerity."

DEMOCRATIC REVIEW, for May, with a portrait of Mr. M'Duffie, apparently in the very act of defending his "forty bale" theory.

POLICY OF ENGLAND TOWARDS IRELAND.

The object of this volume is to take a general review of the treatment of Ireland by England, from the first conquest to the present age, in order to get a distinct perception of the causes that have produced the misery and disorders of that country, for the purpose of discovering a remedy. To carry out this object clearly and orderly, the author has considered his subject under five sections. He first takes a rapid glance at the English domination in Ireland from the conquest of Strongbow to the Revolution of 1688; showing that difference of race, and lust of confiscation, with the fear, contempt, anger, and violence springing from these sources, first induced the conquerors to treat the natives as an inferior sept, whilst the Reformation, by producing a difference of religion, prevented the amalgamation of the two peoples under the most vigorous rule or by the lapse of time. The epoch from the second (or third) conquest of Ireland, by William of Orange, to the close of the last century, is more elaborately treated, to exhibit the excessive severity of the penal laws at a time when persecution for religion was diminishing or dying away elsewhere, and to show how, by means of religious difference, a distinction of caste was kept up, more mischievous than any other system of castes ever established, because it not merely produced inferiority but degradation. The third section embraces the period from the struggles of the Irish people at the close of the last century, to the passing of the Emancipation Act; when the terrible but definite system of the Puritanico-Orangemen was abandoned for the miserable "juste-milieu" and "bit-by-bit" policy, that maintained all the galling degradations of the Catholics, yet allowed them to acquire wealth and power, granted what was granted grudgingly, too late, and imperfectly; the author showing, by quotations from the evidence given before the parliamentary committees, that the payment of the Romish clergy, and their recognition by the state, (as has been lately done under the Charitable Bequests Act,) were declared by O'Connell and the Romish bishops essential parts of any emancipation-scheme. He therefore holds, that the policy of the present time is as exasperating as that of the worst period, in that it still maintains the degrading distinctions of conquest and superiority, whilst it does not act with the consistency of the elder time, which crushed into helplessness those whom it degraded.

Having thus concluded that the privileged church of the minority and the religious degradation of the majority is the monster grievance of Ireland, the author in his fourth section takes an extensive review of the policy followed in other countries with regard to religion, since the fury of state persecutions for opinion has passed away. The practice of Austria, Prussia, Bavaria, Holland, Belgium, France, and some subordinate states, is successively examined; and is shown to treat the different branches of Christian belief with equal respect and encouragement. The Romish states, or rather the states where the rulers or the majority are Romish, pay the Protestant clergy and protect them in their worship—sometimes, as in Austria, going so far as to prevent offensive controversies or reflections in the sermons of rival sects. On the other hand, the states where the Protestants predominate, support the clergy of the Romish church, acknowledge the authority of the

pope, are openly represented by diplomatic envoys, and enjoy all the advantages which spring from the influence of paymaster and protector, and a good understanding with the Court of Rome. Even this Protestant kingdom herself is compelled, by the pressure of circumstances, to adopt this principle everywhere except in Ireland; supporting in her colonies the Episcopalian, Presbyterian, and Romish churches. But whilst the Protestant "state with a conscience" does enough to "break with Heaven," it loses the benefit of its insolvency—"She pays great debts, but she compounds the small." In Ireland, the practical contempt with which the Romanists have been treated causes all the evils of politics and passion in that unhappy country; the non-payment of their clergy renders them hostile to the state, instead of its supporters; whilst our "under-the-rose" relations with the Court of Rome seem to possess the usual disadvantages of clandestine connexions.

Nut long after the Emancipation Act of 1829, it was found that, with millions of Catholics scattered over all parts of the empire, it was indispensable that, for the purpose of communication, we should establish diplomatic relations of some sort with the pope. Our government dared not do so openly and avowedly; they knew that all the bigotry and folly in the country would have instantly been roused to join in full chorus against such an abomination: but the necessity was urgent, and could not be postponed; and accordingly the following expedient was adopted. In 1832, the late Mr. Aubyn (then Attaché to the Legation at Florence) was sent to Rome, where he was ordered to reside without any diplomatic character, and ostensibly as a private gentleman; but by a sort of clandestine diplomacy, he was put in secret and authorized but unacknowledged communication with the cardinal secretary of state, with whom he confidentially transacted business, exactly in the same manner, and for the same purposes, as if he had been the accredited representative of his sovereign. * * *

"Can anything be conceived more inconsistent, and more undignified, than such a private appeal to an authority the existence of which we publicly and ostensibly affect to deny? Nor is this an imaginary case, but one which has actually occurred.

"When a Roman Catholic see in Ireland became vacant a few years ago, according to the usual custom, three names were transmitted to the pope, from which he was to select one. The British government was desirous that the choice should not fall upon a particular individual; and a request was preferred to his holiness, through the channel of our agent, that he would bestow the vacant mitre on either of the other two candidates: but the pope said, that since the Relief Bill had passed, the English government was constantly asking favors of him and requiring his assistance; that he did not find such a disposition to oblige him and conform to his wishes, as to induce him always to comply with theirs, and therefore he should not pass over the person objected to; who consequently received the appointment. Now, this fact seems to prove, first, the egregious folly of doing things by halves, and ineffectually; and secondly, that if we were to deal with the pope in a spirit of frankness and cordiality, and in a manner befitting the dignity of both the contracting parties, he would readily coöperate with us in any measures conducive to the advantage of the people

of Ireland and the security and tranquillity of the empire.

"The pope would no doubt be exceedingly gratified if his authority were formally acknowledged by the queen; and when this was done, nothing is more certain than that we should find every disposition on his part to make its exercise harmonize with the temporal objects of our government.

"When the rebellion broke out in Canada, we requested the pope to exert his authority with the Roman Catholic priests to induce them to assist us in quelling the disturbance; and his Holiness addressed a pastoral letter to them for that purpose, which was attended by the best effects."

The fifth section is devoted to the future policy which our author deduces from the present and the past: and it substantially amounts to a payment of the Romish clergy, the acknowledgment of the pope, a reduction in the Irish Church Establishments—the "appropriation," in fact, which Mr. Ward discovered, and the whigs, after wearing till they wore it out, threw away. The principle of the appropriation, however "irreligious or sacrilegious," is greedily sanctioned by all parties when it is to put money in the purse of the landlords; as the author shows by reference to the various tithe-bills, &c. The difficulties arising from the prejudices of the British people and the interests of the clergy he does not disguise or deny; but he thinks them superable, and by Sir Robert Peel.

"At such a crisis it is impossible not to turn with hope, amounting to expectation, towards Sir Robert Peel, and with confidence that whatever prejudices may still remain elsewhere unrooted, he, at least, will rise superior to them. Not one of all his predecessors in the high office he holds has ever rendered more important services to his country than he has now the opportunity of conferring upon her; and of all men he is the best fitted by character, by capacity, and by position, to accomplish the mighty task that is presented to him. He has already done enough to prove to the world that he is actuated by none of the ordinary motives of vulgar ambition. On a memorable occasion, he consented to make momentous and deeply-felt sacrifices to an overwhelming sense of public duty. The subsequent experience of fifteen years, and that intermediate study of the book of life which is the great instructor and adviser of statesmen, can hardly have failed to make him contemplate the discharge of his public obligations in a spirit more independent and more stern; and in a recent instance he evinced a firmness and decision, and a fearlessness of giving offence, equally indicative of his indifference to the possession of office and his resolution to retain it no longer than he was permitted to exercise the power it conferred according to his own judgment of what was most beneficial to the state. From the very beginning of his public career Sir Robert Peel may claim to be called a Reformer. He has, through the whole course of his political life, steadily, consistently, but cautiously, endeavored to correct abuses and errors, and to amend the laws, in order to improve the social condition of the country. Having without scruple freely canvassed his antecedent conduct, I may without scruple do justice to the purity of his motives, the sagacity of his views, and the good services he has performed: but the best of those services will sink into insignificance in comparison with the pacification and reconciliation of Ireland, if Providence

should reserve to him the crowning mercy of such an achievement. It would indeed be a fallacy and a delusion to suppose that he, or any man, or any set of men, could by any measures, however politic or pacific, immediately dry up the ancient sources of weakness and disunion in that country; it would be over sanguine to expect that Ireland should be at once and completely incorporated in feeling, as well as in law, with the rest of the empire; all that he can do is to lay the foundations, foundations broad and deep, on which a superstructure of conciliation and union may gradually be built."

Except in the condensed exposition of the practice of the principal European states in dealing with religion, and the correlative proof that Ireland is an exception to the civilized world, there is no novelty in the course or conclusions of this volume. An historical review of the treatment of Ireland by England is a stock theme in all books or pamphlets upon Irish policy; many years since, Sydney Smith urged the payment of the Romish clergy, with a cogency of argument as well as of wit that would have settled the matter long ago had mere reason been allowed to settle it; whilst numbers, conspicuous for their position, have proposed dealings with Irish Church property, from reduction to extinction. The book, however, is very able. It displays, indeed, the reading of a gentleman rather than the research of an historical inquirer, for Davies and Bacon are the most original authorities referred to; and occasional passages rather exhibit the writer, giving an artificial force and effect to this matter; still, the selection of historical illustrations is sufficient for the purpose, and the rhetorical passages are rare, though the work throughout seems to be the product of a pen accustomed to address the public. The whole subject is better digested, and the matter consequently closer and fuller, than the littérateur is in the habit of attaining to. There is, too, an air of quiet conviction about the views, with a self-possession and retenue, seldom displayed by the mere writer, as well as a perfect freedom of handling great affairs and great men without unduly depreciating them, rarely acquired except by a man of the world.

We have thus far spoken of the book from internal evidence. There are intimations abroad that its importance is derived from the time of its appearance and the position of its author. The *Morning Post* regards its advent as the sign of some new treason to the Protestant cause on the part of Peel; whilst the *Morning Chronicle* holds that it is the production of a Conservative of station who speaks the opinions of other Conservatives. How much of this is well-founded, time will show; but the probable station of the author gives an interest to some of the facts which he intermingles with his narrative, as they contain what the elder Disraeli would call "materials for secret history." Sending the reader to the volume for polemics, we shall take our extracts from these more anecdotal passages in reference to the passing of Catholic Emancipation.

ANOTHER SILLINESS OF GEORGE THE FOURTH.

There is not a doubt that, if they [Peel and Wellington] had followed their own inclinations and consulted their own merely personal interests, they would have resigned, and left the Whigs to carry out the measure [Catholic Emancipation] they had so long labored to promote: but they

soon found that the work could only be done by themselves, and that they must either expose the country to enormous danger or undertake a task full of difficulty and humiliation, which could not fail to expose them to the bitterest obloquy and reproach, to the disruption of old friendships and connexions, and every sort of unpopularity. They at once flung aside all personal and selfish considerations. They did not hesitate to sacrifice their own characters for consistency; and, what was a still greater sacrifice, they did not scruple to adopt the means and expedients (repulsive as they must have been) by which alone success could be insured. The first thing to be done was to impart their designs to the king; and having obtained his consent, to conceal them from the rest of the world. The king was in the highest degree disgusted at the intimation; but he declared that he would only give his consent upon the condition of their *all* remaining in office, and *themselves* carrying the measure through Parliament; and to this, therefore, they made up their minds to submit. He also required that the matter should be revealed to no human being out of the cabinet; well knowing the personal annoyance to which he should be exposed if it once got wind. The ministers also were aware that it was essential to prevent a No-Popery agitation being got up in England; and they were therefore fully agreed with his majesty on this point.

The sole chance of resisting the Liberal party, conjoined with Peel, Wellington, the official Tories, and the Tory advocates of Emancipation, was in rousing the Protestant masses of England, and then going to the country with "The King and No Popery." But the trouble was too great for the Sybarite; and, to save himself a little "personal annoyance," he proposed to cut off the supplies and soldiers of his own force. How the Great Captain must have inwardly chuckled at such stipulations for the plan of the campaign! Here is his majesty again.

"Meanwhile, the cauldron of Irish affairs was perpetually flaring up with some fresh ingredient that was cast into it. In the beginning of 1829, Lord Anglesey's recall excited, in different ways, both Catholics and Protestants, and tended to make the Duke's intentions more ambiguous than ever. The correspondence which led to that recall was itself caused by the unfortunate course of keeping the Lord-Lieutenant in the dark. He was, not unnaturally, provoked with the duke's want of confidence; while, without intending it, the free and frank expression of his opinions embarrassed the duke and exasperated the king. It was the king himself who vehemently insisted upon the recall of Lord Anglesey, though the duke took all the responsibility and odium of that measure upon himself. Such were the difficulties and the personal differences which this long course of mystification unhappily produced, and which continued up to the eve of the meeting of Parliament."

**DIFFICULTIES OF THE MINISTRY: "THE DOCTOR"
SENT FOR.**

A call of the house had been ordered on the 5th March, on which day Mr. Peel was to bring the emancipation bill before the house of commons; but in the mean time the Duke of Cumberland, backed by Lord Eldon and the old Anti-Catholic party, had contrived to work the king's mind into a state of frenzy. He passed his days in railing

against the bill and its authors; and he went so far as to desire a person high in his intimacy and confidence to tell all his household that he wished them to vote against it; a command which the individual to whom it was given was, fortunately, too prudent to obey. If his majesty's ill-humor had been confined within the walls of his palace, and had there evaporated, it would not have much signified; but as the time drew near when the irrevocable step was to be taken of proposing the relief bill to parliament, he exhibited very alarming symptoms of a disposition to waver and draw back.

On the 3d of March, it was generally known that the bill was in the greatest jeopardy; and nothing could exceed the consternation which prevailed among the friends of government and emancipation. On Sunday, the king sent for the chancellor, pretended that he had not been aware of all the provisions of the bill, said that the securities did not satisfy him, and he would not consent to it. The chancellor could do nothing with him; so, instead of returning to town, he proceeded to Strathfieldsaye, where the Duke of Wellington was gone to receive the judges; there he arrived at three in the morning, and communicated to the duke what had passed. On Monday, the duke went himself to Windsor, and told the king plainly that it was too late now to recede, and if his majesty made any more difficulties he would instantly resign. The king began whimpering, said he thought the duke would never desert him in any circumstances; but, finding him totally deaf to his appeals *ad misericordiam*, told him he would take a day to consider of his final determination, and communicate it to him. The government considered themselves out, and thought everything was at an end: meanwhile, the king sent to Lord Sidmouth, and proposed to him to come and help him to overthrow the bill, and set the Duke of Wellington and O'Connell at defiance. But Eldon's "young master" did not inspire the confidence which his old master might have done—Lord Sidmouth would not trust him; he refused, saying to his confidants, that he would have done it for the father, but could put no reliance in the son.

THE LAST LITTLENESS.

When the Duke of Wellington made up his mind to carry the Catholic question, he wisely resolved to do it completely, to give unqualified emancipation, and not to trouble himself about securities; at the same time he was beset with difficulties which it required all his authority, and no small tact and management, to surmount. He had to gain over the king and the Tory party, and to reconcile both to the measure which of all others they most abhorred. His object was to give satisfaction to the Catholics, and at the same time to make the concession as palatable as he could to his royal master and his own friends. Of all living men he most thoroughly knew George the Fourth: but, whatever may have been his personal opinion of the king, he had a profound reverence for his office; and he probably felt that he was not entitled to deal in a very peremptory manner with prejudices which he had himself only so lately discarded. It may be presumed that it was for these reasons he condescended to humor the king in his angry and ungracious mood. The king could not raise his mind to the height of the great argument, nor wisely give the assent,

which he dared not withhold, in a frank and gracious spirit. On the contrary, he became peevish and querulous, made his reluctance notorious to the whole world, gave all the trouble he could to his ministers, and, instead of courting the popularity which he might easily have obtained from the Irish, was bent upon gratifying his spiteful and vindictive feelings by the exclusion of O'Connell from the seat he had won; and it was the king himself who insisted that the clause in the act should be so worded as to render the Clare election null and void. To this miserable revenge, this kick at the living lion, it was unfortunately thought worth while to consent.

From the Spectator

MRS. NORTON'S CHILD OF THE ISLANDS.

Who shall say that Blue Books are useless?—seeing that they furnish materials for fiction, and illustrations for poetry. Writers of yore, who wished to strike out a new line of composition, had to look about them upon life, and learn what Reynolds calls “the art of seeing nature.” But “that great *primum mobile* of all human affairs, the barrister of six years standing,” has superseded these necessities of personal effort. The Report of a Commission of Inquiry, with Appendixes from A to Z, gives us a short cut to various classes of life, which our predecessors had to find out for themselves. Miners, milliners, factory children, agricultural laborers, and paupers, are exhibited, at least in their modes of living. The statist, the most unimaginative of men, are the cause of imaginative works in others; and if the reporters be permitted to go on as they are going, we shall soon have the physical as well as the moral diseases of felons laid before the world. No doubt, in these succedanea for experience, we miss the *life* with all its variety of character and its counteracting circumstances, even should these be, unhappily, nothing more than the hardness induced by wretchedness, or the drawbacks upon comfort arising from recklessness, sloth, and vice. But this is an evil inseparable from second-hand knowledge: one can only have it in the gross.

The Child of the Islands, the nominal hero of Mrs. Norton's poem, is the baby Prince of Wales: but he serves to little other purpose than the plot of Mr. Bayes. Spring, Summer, Autumn, Winter, with an opening and conclusion, are the divisions of the poem; and in each there is some allusion to the prince—as to his worldly advantages, for example, that he will not feel the cold of winter—or a graceful intimation that he cannot escape the common lot of humanity—or elegant descriptions of what is possibly the palatial life of modern heirs-apparent; mingled with many loyal but not gross or fulsome aspirations for his future prosperity, virtue, and happiness. The real character of *The Child of the Islands*, however, is a series of outpourings upon the condition of the poor. Mrs. Norton says, (indeed she proves, by reprinting some letters to the *Times* newspaper of the date of 1841,) that she entertained these philanthropical views before they became the fashionable talk, and in some cases possibly the fashionable cant: but first appearance in literature forestalls an after comer; and the repetition of the subject, in a similar strain of feeling, from Jerrold and Dickens down to scribes innumerable, has deprived it of some force and freshness. Beyond the feminine character of the writer's mind, with

the graceful illustrations of poetry and the music of verse, there is not much of novelty in *The Child of the Islands*. The images are many of them taken from the sources we have indicated: for instance, the youthful trapper in the mine shut out from the light of heaven; the miseries of the sempstresses; and the wretches congregating in winter under the trees in Hyde Park, to which several leading articles in the *Times* called public attention. The more original topics, if not equally obvious, are almost as general property: the contrast between the splendors of London fashion and the squalidness of London want; various domestic pictures in the different grades of life; landscapes adapted to the four seasons of the year; with episodes according to circumstances—thus a fall of snow in “Winter” leads, from an English churchyard and the sorrows its deaths have occasioned, to the disastrous retreat from Cabul. These kinds of incidents and images are freely mixed with reflections; and, varied by the continual recurrence of the leading theme of the rondo, the Prince of Wales, form the matter of *The Child of the Islands*.

Topics so common to the literature of the times, and a plan so arbitrary and inartificial, can have little intrinsic power. The interest of the work must arise from its workmanship: and the merit of this is great, in several points of view. Ease and finish of diction prevail throughout, with much beauty of thought and imagery, and a spirited style. The *sentiment* of the woman is everywhere, with its home feelings, its proneness to pity, and its readiness to decide upon the first impression from the first single view, without regard to the truism that “much may be said on both sides.” Considered as a work of fashion, it may be pronounced the poem of the season. Regarded in a more critical aspect, the execution has deficiencies analogous to those of its matter. There is seldom much that is absolutely fresh in the images, little very striking or original in the style—nothing which fixes the reader and impresses him with the idea that he is in the power of a master-mind. The poem is written in the Spenserian stanza; and though the imitation of Byron is not glaring, we are frequently reminded of *Childe Harold*, especially in the numerous reflections that follow the examples of the misery of the poor, or the inequalities of fortune, or for that matter the inevitable laws of nature: but the half-wailing, half-pompous gloom, which was appropriate enough to the misanthropical Childe, is not so well adapted to the themes of Mrs. Norton. Perhaps, too, the style is somewhat too diffuse: no single stanzas can be called weak, yet the general impression is rather one of weakness.

This, however, is not visible in any single passage, or perhaps in any single section; and several sittings at intervals would be the best plan of perusal. How it will read in that mode, we will indicate by a couple of topics, rather long, but complete in themselves. The first is from “Hyde Park;” but the particular subject relates chiefly to the homeless outcasts, whose case excited so much attention when first noticed.

LONDON OUTCASTS.

Betwixt the deathly stream and Tyburn Gate
Stand withered trees, whose sapless boughs
have seen
Beauties whose memory now is out of date,
And lovers on whose grave the moss is green!

While Spring, forever fresh, with smile serene,
Woke up gray Time, and drest his scythe with
flowers,
And flash'd sweet light the tender leaves be-
tween,
And bid the wild bird carol in the bowers,
Year after year the same, with glad returning hours.

Oh, those old trees! what see they when the
beam

Falls on blue waters from the bluer sky!
When young Hope whispers low, with smiles
that seem

Too joyous to be answered with a sigh!

The scene is then of prosperous gaiety—
Thick-swarming crowds on summer pleasure
beast,

And equipages form'd for luxury;
While rosy children, young and innocent,
Dance in the onward path, and frolic with content.

But when the scattered leaves on those wan
boughs

Quiver beneath the night-wind's rustling
breath;

When jocund merriment, and whisper'd vows,
And children's shouts, are hush'd, and still as
death

Lies all in heaven above and earth beneath;
When clear and distant shine the steadfast stars,
O'er lake and river, mountain, brake and
heath,

And smile, unconscious of the woe that mars
The beauty of earth's face, deform'd by Misery's
scars;

What see the old trees THEN? Gaunt, pallid
forms

Come, creeping sadly to their hollow hearts,
Seeking frail shelter from the winds and storms,
In broken rest, disturb'd by fitful starts;
There, when the chill rain falls, or lightning
darts,

Or balmy summer-nights are stealing on,
Houseless they slumber, close to wealthy
marts

And gilded homes: there, where the morning sun
That tide of wasteful joy and splendor look'd upon.

There the man hides whose better days are
dropp'd

Round his starvation, like a veil of shame;
Who, till the fluttering pulse of life hath stopp'd,
Suffers in silence, and conceals his name:
There the lost victim, on whose tarnish'd fame
A double taint of Death and Sin must rest,
Dreams of her village home and parents'
blame,

And in her sleep, by pain and cold oppress,
Draws close her tatter'd shawl athwart her shiv-
ering breast.

Her history is written in her face:

The bloom hath left her cheek, but not from
age;

Youth, without innocence, or love, or grace,
Blotted with tears, still lingers on that page;
Smooth brow, soft hair, dark eyelash, seem
to wage

With furrowed lines a contradiction strong;

Till the wild witchcraft stories, which engage
Our childish thoughts, of magic change and
wrong,

Seem realized in her—so old, and yet so young!

And many a wretch forlorn, and huddled group
Of strangers met in brotherhood of woe,
Heads that beneath their burden weakly stoop,
Youth's tangled curls, and Age's locks of
snow,

Rest on those wooden pillows, till the glow
Of morning o'er the brightening earth shall pass;
And these depart, none asking where they go;
Lost in the World's confused and gathering
mass,

While a new slide fills up Life's magic-lantern
glass.

The following, though not new in its essential
idea, is far from hacknied; and it offers an ex-
ample of one of the proper functions of poetry—
the personification of a general principle.

IGNORANCE IN THE DOCK.

The criminal is in the felon's dock:
Fearful and stupified, behold him stand!

While to his trial cold spectators flock,
And lawyers grave, and judges of the land.
At first he grasps the rail with nervous hand,
Hearing the case, which learnedly they state,

With what attention ignorance can command:
Then, weary of such arguing of his fate,
Torpid and dull he sinks, throughout the long
debate.

Vapid, incomprehensible to him

The skilful pleader's cross-examining wit;
His sullen ear receives, confused and dim,
The shouts of laughter at some brilliant hit,
When a shrewd witness leaves the biter bit.

He shrinks not, while the facts that must prevail
Against his life unconscious friends admit;
Though Death is trembling in the adverse scale,
He reckes no more than if he heard the autumn gale

Oh Eloquence, a moving thing art thou!

Tradition tells us many a mournful story
Of scaffold-sentenced men, with noble brow,
Condemn'd to die in youth, or weak and hoary,
Whose words survived in long-remembered
glory!

But eloquence of words the power hath not
(Nor even their fate, who perish'd gaunt and
gory)

To move my spirit like his abject lot,
Who stands there, like a dog new-sentenced to be
shot!

Look, now! Attention wakes, with sudden start,
The brutish mind which late so dull hath been!
Quick grows the heavy beating at his heart!

The solemn pause which rests the busy scene,
He knows, though ignorant, what *that* must
mean—

The Verdict! With the Jury rests his chance!
And his lack-lustre eye grows strangely keen,
Watching with wistful, pleading, dreadful
glance,

Their consultation cease, their Foreman slow ad-
vance.

His home, his hopes, his life, are in that word!

His ties! (for think ye not that he *hath* ties!)
Alas! Affection makes its pleading heard

Long after better sense of duty dies,
Midst all that Vice can do to brutalize.

Hark to the verdict—"Guilty!"—All are foes!
Oh, what a sight for good, compassionate eyes,

That haggard man, as, stupified with woes,
Forth from the felon's dock a wretch condemn'd:
he goes!

From the Examiner.

A Fragment on the Irish Roman Catholic Church.
By the late REV. SYDNEY SMITH. Longman & Co.

WHAT Sydney Smith said of Mackintosh is now to be said of Sydney Smith.

"When I turn from living spectacles of stupidity, ignorance, and malice, and wish to think better of the world, I remember my great and benevolent friend Mackintosh. * * * If he had been arrogant and grasping; if he had been faithless and false; if he had been always eager to strangle infant genius in its cradle; always ready to betray and to blacken those with whom he sat at meat, he would have passed many men, who, in the course of his long life, have passed him."

There was no anecdote of himself which Sydney Smith had a juster pride in relating, than the dialogue ending with Lord Stowell's remark, *Oh Mr. Smith! you would have been a much richer man if you had come over to us!* Of course he would have been a much richer man. He would have been a bishop. The Tories are not afraid of making a pamphleteer a bishop; even when pamphleteer means libeller, as it meant in the days of Addison.

Sydney Smith's pamphleteering meant no such thing. It was keen to enliven and exalt, but never to malign and vituperate. It was generous, earnest, healthy. It set itself against the frauds, inanities, and absurdities, which pass current in the world. It raised the hue-and-cry after cant, pretension, and quackery. But, not being malignant, it was not dull enough to be decorous. "He cannot be a Christian who wrote the *Tale of a Tub*," said a decent whig of a hundred years ago: "and your Majesty must be sure that the man you would make a bishop is a Christian." So Swift died Dean of St. Patrick's, and Sydney Smith Canon of St. Paul's.

We do not like parallels. There is commonly a strain in them, and the effort does not favor truth. Therefore we shall not compare the Drapier with Peter Plymley, however strong the resemblance we might find, in their pungency of wit and in their easy strength and transparent clearness of style. But there is so curious an identity in one of the later passages of the lives of these famous letter-writers, that we may be pardoned for adverting to it.

The bishops' bill of 1751 for subdividing large livings into as many portions as the bishops should think fit, was a counterpart to the church commission bill of 1836 for mutilating deans and chapters and trimming cathedrals to a Bloomfield measure. And both bills were lost by the wit with which both were assailed. "Swift," says Sir Walter Scott, "thought he discovered a scheme on the part of the prelates to impoverish and degrade the body of the clergy, besides subjecting them to the absolute dominion of their spiritual superiors;" and Sydney Smith, right or wrong, thought just the same. The Dean of St. Patrick's wrote to his friend Bishop Sterne; the Canon of St. Paul's wrote to his friend Archdeacon Singleton; and, till this hour, one may open the letter of the bishop, and mistake it for that of the archdeacon. Has not the voice of the earlier the very trick and accent of the later wit? "Upon this open avowed attempt, in almost the whole bench, to destroy the church, I resolved to have no

more commerce with persons of such prodigious grandeur, who, I feared, in a little time, would expect me to kiss their slippers. It is happy for me that I know the persons of very few bishops; and it is my constant rule, never to look into a coach; by which I avoid the terror that such a sight would strike me with." In both instances, as we have said, the bishops were worsted. Dean and canon found themselves masters of the field, while

the new Iscariots

Came headlong tumbling from their mitred chariots.

In a clever notice of Sydney Smith given by the *Morning Chronicle*, the opinion of a recent French critic was adopted, to the effect that "the characteristic of Sydney Smith's mind was a keen perception of the grotesque side of whatever was bad and unjust, and that his power lay in developing the constant relation which subsists between falsehood and absurdity." But surely the latter expression cannot be correctly employed. What is relation? "When the mind so considers one thing," says Locke, "that it does, as it were, bring it to, and set it by another, and carry its view from one to t'other; this is, as the words import, relation." Now falsehood cannot in any such sense be said to have relation with absurdity. They cannot be set by each other and compared; they cannot be separated. They are one. The absurdity is from the first inherent in the falsehood; and the art of Sydney Smith consisted in this, that he pushed the falsehood to disclosure of its absurdity. We take it to have been his highest art. In nothing was his mastery more apparent. Woe to the falsehood that he so pursued! All its shirking, shrinking, doubling, and evading, availed it not. Inevitable doom awaited it. It must confess the folly that was in it. It must give forth its *Noodle's Oration*.

But how beautiful were the serious moods of Sydney Smith. What a fine fulness and solidity they had: drawn from the strength of justice, which we believe to have been the ruling sense of his mind; and tempered with the warmth of charity, of which no man had a larger share. What a picture is that in one of his sermons, where he described the village school and the tattered scholars, and the aged, poverty-stricken master teaching the mechanical art of reading or writing, and thinking he was teaching that alone, while in truth he was "protecting life, insuring property, fencing the altar, guarding the throne, giving space and liberty to all the fine powers of man, and lifting him up to his own place in the order of creation." What a scene is that of the poor wretched prisoner on his trial, struggling against the agonies of his spirit, and the rudeness of his conceptions, and his awe of better dressed and better taught men, and the shame which the accusation had brought upon his head, and the sight of his parents and children gazing at him in court, for the last time perhaps, and after a long absence—asked, under the old criminal law, what he had to say in his defence, saying that he left it to his counsel, and told that his counsel could not be heard! "The mariner sinking in the wave does not want a helping hand more than does this poor wretch. But help is denied to all. Age cannot have it, nor ignorance, nor the modesty of women! One hard uncharitable rule silences the defenders of the wretched, in the worst of human

evils; and, at the bitterest of human moments, mercy is blotted out from the ways of men!"

But the road to a bishoprick is through "the Frogs of Aristophanes and the Targum of Onkelos," or it lies among the fouler ways of servility and bigotry; not in such thoughts as these. Our interest in the matter is not much; but we think it a pity for those who love the Episcopal bench, that it should be constrained to dulnesses forever.

"What a blessing to this country would a real bishop be! A man who thought it the first duty of Christianity to allay the bad passions of mankind, and to reconcile contending sects with each other. What peace and happiness such a man as the Bishop of London might have conferred on the empire, if, instead of changing black dresses for white dresses, and administering to the frivolous disputes of foolish zealots, he had labored to abate the hatred of Protestants for the Roman Catholics, and had dedicated his powerful understanding to promote religious peace in the two countries. Scarcely any bishop is sufficiently a man of the world to deal with fanatics. The way is not to reason with them, but to ask them to dinner. They are armed against logic and remonstrance, but they are puzzled in a labyrinth of wiles, disarmed by facilities and concessions, introduced to a new world, come away thinking more of hot and cold, and dry and sweet, than of Newman, Keble, and Pusey. So mouldered away Hannibal's army at Capua! So the primitive and perpendicular prig of Puseyism is softened into practical wisdom, and coaxed into common sense! Providence gives us generals, and admirals, and chancellors of the exchequer; but I never remember in my time a real bishop—a grave elderly man, full of Greek, with sound views of the middle voice and preterperfect tense, gentle and kind to his poor clergy, of powerful and commanding eloquence; in parliament never to be put down when the great interests of mankind were concerned; leaning to the government when it was right, leaning to the people when they were right; feeling that if the Spirit of God had called him to that high office, he was called for no mean purpose, but rather that, seeing clearly, and acting boldly, and intending purely, he might confer lasting benefits upon mankind."

This passage is from the *Fragment* before us; a posthumous and "unrevised" publication. "If it serves no other purpose," it is said in a brief preface, "it will at least prove that his *last*, as well as his earliest efforts, were exerted for the promotion of religious freedom, and may satisfy those who have objected to his later writings, because his own interest appeared to be bound up with his opinions, that he did not hesitate, to the last moment of his life, boldly to advocate what he considered to be justice to others." We do not think the proof was needed, believing the objections frivolous; and we must frankly say, on the whole, that we could have spared this *Fragment*.

Not because it is unrevised in point of style. What our contemporaries remark of the polish and elaboration of Sydney Smith's sentences, is certainly erroneous. He wrote, if ever man did, *Currente Calamo*. Corrections, either in his manuscript or proof, were extremely rare. Our object is of another kind. "There would have been a time" for such a *Fragment*, which is not now; not to say that its illustrations are scarcely

borne out by its argument. But since wit does not lose value as wit, because it is not wisdom, let us satisfy the curiosity of the reader with one or two extracts more.

SHE IS NOT WELL.

"The revenue of the Irish Roman Catholic church is made up of half-pence, potatoes, rags, bones, and fragments of old clothes, and those Irish old clothes. They worship often in hovels, or in the open air, from the *want* of any place of worship. Their religion is the religion of three fourths of the population! Not far off, in a well-windowed and well-roofed house, is a well-paid Protestant clergyman, preaching to stools and hassocks, and crying in the wilderness; near him the clerk, next him the sexton, near him the sexton's wife—furious against the errors of Popery, and willing to lay down their lives for the great truths established at the Diet of Augsburg.

"There is a story in the Leinster family which passes under the name of

She is not well.

"A Protestant clergyman, whose church was in the neighborhood, was a guest at the house of that upright and excellent man the Duke of Leinster. He had been staying there three or four days; and on Saturday night, as they were all retiring to their rooms, the duke said, 'We shall meet to-morrow at breakfast.'—'Not so (said our Milesian Protestant;) your hour, my lord, is a little too late for me; I am very particular in the discharge of my duty, and your breakfast will interfere with my church.' The duke was pleased with the very proper excuses of his guest, and they separated for the night;—his grace perhaps deeming his palace more safe from all the evils of life for containing in its bosom such an exemplary son of the church. The first person, however, whom the duke saw in the morning upon entering the breakfast-room was our punctual Protestant, deep in rolls and butter, his finger in an egg, and a large slice of the best Tipperary ham secured on his plate. 'Delighted to see you, my dear vicar,' said the duke; 'but I must say as much surprised as delighted.'—'Oh, don't you know what has happened?' said the sacred breakfaster,—'*she is not well.*'—'Who is not well?' said the duke: 'you are not married—you have no sister living—I'm quite uneasy; tell me who is not well.'—'Why, the fact is, my lord duke, that my congregation consists of the clerk, the sexton, and the sexton's wife. Now the sexton's wife is in very delicate health: when she cannot attend, we cannot muster the number mentioned in the rubric; and we have, therefore, no service on that day. The good woman had a cold and sore throat this morning, and, as I had breakfasted but slightly, I thought I might as well hurry back to the regular family dejeuner.' I don't know that the clergyman behaved improperly; but such a church is hardly worth an insurrection and civil war every ten years."

BISHOPS, PROTESTANT AND CATHOLIC.

"If I were a bishop, living beautifully in a state of serene plenitude, I don't think I could endure the thought of so many honest, pious, and laborious clergymen of another faith, placed in such disgraceful circumstances! I could not get into my carriage with jelly-springs, or see my two courses every day, without remembering the buggy and

the bacon of some poor old Catholic bishop, ten times as laborious, and with much more, perhaps, of theological learning than myself, often distressed for a few pounds! and burthened with duties utterly disproportioned to his age and strength. I think, if the extreme comfort of my own condition did not extinguish all feeling for others, I should sharply commiserate such a church, and attempt with ardor and perseverance to apply the proper remedy."

REPEAL OF THE UNION.

"Much as I hate wounds, dangers, privations, and explosions—much as I love regular hours of dinner—foolish as I think men covered with the feathers of the male *Pullus domesticus*, and covered with lace in the course of the ischiatic nerve—much as I detest all these follies and ferocities, I would rather turn soldier myself than acquiesce quietly in such a separation of the empire.

"It is such a piece of nonsense, that no man can have any reverence for himself who would stop to discuss such a question. It is such a piece of anti-British villany, that none but the bitterest enemy of our blood and people could entertain such a project! It is to be met only with round and grape—to be answered by Shrapnel and Congreve; to be discussed in hollow squares, and refuted by battalions four deep; to be put down by the *ultima ratio* of that armed Aristotle the Duke of Wellington.

"O'Connell is released; and released I have no doubt by the conscientious decision of the law lords. If he was unjustly (even from some technical defect) imprisoned, I rejoice in his liberation. England is, I believe, the *only* country in the world, where such an event *could* have happened, and a wise Irishman (if there be a wise Irishman) should be slow in separating from a country whose spirit can produce, and whose institutions can admit, of such a result. Of his guilt no one doubts, but guilty men must be hung technically and according to established rules; upon a statutable gibbet, with parliament rope, and a legal hangman, sheriff, and chaplain on the scaffold, and the mob in the foreground.

"But, after all, I have no desire my dear Daniel should come to any harm, for I believe there is a great deal of virtue and excellent meaning in him."

COMMUNICATION WITH THE POPE.

"It turns out that there is no law to prevent entering into diplomatic engagements with the pope. The sooner we become acquainted with a gentleman who has so much to say to eight millions of our subjects the better! Can anything be so childish and absurd as a horror of communicating with the pope, and all the hobgoblins we have imagined of preunires and outlawries for this contraband trade in piety? Our ancestors (strange to say wiser than ourselves) have left us to do as we please, and the sooner government do, what they *can* do legally, the better. A thousand opportunities of doing good in Irish affairs have been lost, from our having no avowed and dignified agent at the court of Rome. If it depended upon me, I would send the Duke of Devonshire there to-morrow, with nine chaplains and several tons of Protestant theology. I have no love of popery, but the pope is at all events better than the idol of Juggernaut, whose chaplains I believe we pay, and whose chariot I dare say is made in long acre. We pay 10,000*l.* a year to our am-

bassador at Constantinople, and are startled with the idea of communicating diplomatically with Rome, deeming the sultan a better Christian than the pope!"

The argument of the *Fragment* is for a state provision to the Roman Catholic Clergy. It has often been advocated; oftener than the already existing Irish example of a state provision, and a comparison of the performance of duties by a paid and an unpaid clergy, might seem to warrant. There are obstinate people who will continue to think, and to imagine themselves warranted by the experience of history in thinking, that nothing is so sure to corrupt religious teaching as interference from temporal governors; and who will point to church-and-state connexion for the proof, that by making the one dependent on the other, you make each the ally of the other's abuses. It is admitted on all hands that the religious duties of the Roman Catholic clergy in Ireland are as faithfully performed as those of any clergy in the world; more faithfully than most. We should dread to disturb this, if we had authority. The evil political power of the Irish priest is a direct emanation of the existing state establishment. Assail *that* if you will; but do not think to correct its abuses by raising up another; nor imagine that you could peaceably or reasonably adjust such rival claims. What, for example, should be the apportionment to the religion of the seven millions, and what to the religion of the one million! The analogy resorted to is the Presbyterian Church in Scotland; but it fails in the important particular of the rival establishment.

In Sydney Smith's "Private Memoranda of Subjects," intended to have been introduced in the pamphlet was found a pregnant sentence:—"England should cast off its connexion with the Irish Church." To that we give a hearty Amen.

From the Spectator.

In addition to all that is passing on the question of religious temporalities, the present week has been enriched by a *Fragment on the Irish Roman Catholic Church*, from the dying hand of Sydney Smith; which his executors have properly given to the world. From a prefixed list of "private memoranda of subjects intended to have been introduced in the pamphlet," we catch a glimpse of the manner in which the author prepared his matter, and the fullness with which he would have treated his subject had life been spared to him: one significant jotting of "a head," as yet untouched—"England should cast off its connexion with the Irish Church"—shows the length to which he himself was prepared to go. Looking at the plan so far as rough-sketched by its author, it may not critically be pronounced so complete and orderly a view as many productions. It is not so complete as a college theme, or a prize essay, or an article for a cyclopædia. It throws overboard all appeals to history, and even all arguments deduced from abstract principles, as if they were done with; and comes at once to the practical view. But how thoroughly the *più* of the broad, common sense, working views is presented! Here and there, perhaps, may be found a rather weak sentence or a flat joke, which even a revision of the *Fragment* might have removed; but what a masterly comprehension of the present and immediate! how thorough an appreciation of what practically bears upon the case though seeming as a mere topic to look remote—what a quiet

rejection of all that is really remote though looking near! Then, too, what flashes of wit!—not merely that cold or studious conceit which consists “in bringing remote images happily together,” but an urging of the aptest arguments in the most cogent way, with illustrations that not only strengthen the reasoning, but present living pictures to the mind. Age did not deaden his sympathies nor blunt his wit; nor, O rare Sydney, cause a single change in his principles or political views. So just was his foresight, so keen his appreciation of national requirements, and so slowly does the world wag onward, that, while all around were changing, he and the Duke of Newcastle, political antipodes, alone stood on their old spot. “Sum quod fui” might have been his motto on his dying-day. Or if advancing years, and a political revolution that has made other men turn round like whipping-tops, modified anything, it was his party-spirit. The cant and cowardice of mere whiggery he never had; but of late years there was perhaps less of an opposition hatred than in the days when Canning was the object of his sarcasm as a “diner-out.” Yet his spirit might say, and truly, “I was always a conservative; always for maintaining the institutions of the country, but reforming all proved abuses. More than forty years ago, I began to lay down the principles of true conservatism: men have come to me, I have not gone to them.” There is gall and wormwood to fustian liberals in many parts of this last legacy. Here is one especially, in an estimate of the “Monster Trial.”

“Sir Robert did well in fighting it out with O’Connell. He was too late; but when he began he did it boldly and sensibly; and I, for one, am heartily glad O’Connell has been found guilty and imprisoned. He was either in earnest about repeal or he was not. If he was in earnest, I entirely agree with Lord Grey and Lord Spenser, that civil war is preferable to repeal. Much as I hate wounds, dangers, privations, and explosions—much as I love regular hours of dinner—foolish as I think men covered with the feathers of the male *pullus domesticus*, and covered with lace in the course of the ischiatic nerve—much as I detest all these follies and ferocities, I would rather turn soldier myself than acquiesce quietly in such a separation of the empire.”

THE MORAL OF THE REVERSAL.

O’Connell is released; and released, I have no doubt, by the conscientious decision of the law lords. If he was unjustly (even from some technical defect) imprisoned, I rejoice in his liberation. England is, I believe, the *only* country in the world where such an event *could* have happened; and a wise Irishman (if there be a wise Irishman) should be slow in separating from a country whose spirit can produce and whose institutions can admit of such a result. Of his guilt no one doubts; but guilty men must be hung technically and according to established rules—upon a statutable gibbet, with parliament rope, and a legal hangman, sheriff, and chaplain on the scaffold, and the mob in the foreground.

THE FIRST THING FOR IRELAND.

The first thing to be done is to pay the priests; and after a little time they will take the money. One man wants to repair his cottage; another wants a buggy; a third cannot shut his eyes to the dilapidation of a cassock. The draught is

payable at sight in Dublin, or by agents in the next market-town dependent upon the commission in Dublin. The housekeeper of the holy man is importunate for money; and if it is not procured by drawing for the salary, it must be extorted by curses and comminations from the ragged worshippers, slowly, sorrowfully, and sadly. There will be some opposition at first; but the facility of getting the salary without the violence they are now forced to use, and the difficulties to which they are exposed in procuring the payment of those emoluments to which they are fairly entitled, will in the end overcome all obstacles. And if it does not succeed, what harm is done by the attempt! * * *

The Roman Catholic priest could not refuse to draw his salary from the state without incurring the indignation of his flock. “Why are you to come upon us for all this money, when you can ride over to Sligo or Belfast, and draw a draught upon government for the amount?” It is not easy to give a satisfactory answer to this, to a shrewd man who is starving to death.

PEEL AND THE ULTRAS.

I have some belief in Sir Robert. He is a man of great understanding, and *must* see that this eternal O’Connell will never do—that it is impossible it can last. We are in a transition state, and the Tories may be assured that the baronet will not go too fast. If Peel tells them that the thing must be done, they may be sure it is high time to do it: they may retreat mournfully and sullenly before common justice and common sense, but retreat they *must* when Tamworth gives the word—and in quick-step too, and without loss of time.

And let me beg of my dear Ultras not to imagine that they survive for a single instant without Sir Robert—that they could form an Ultra-Tory Administration. Is there a Chartist in Great Britain who would not, upon the first intimation of such an attempt, order a new suit of clothes, and call upon the baker and milkman for an extended credit? Is there a political reasoner who would not come out of his hole with a new constitution? Is there one ravenous rogue who would not be looking for his prey? Is there one honest man of common sense who does not see that universal disaffection and civil war would follow from the blind fury, the childish prejudices, and the deep ignorance of such a sect? I have a high opinion of Sir Robert Peel; but he must summon up all his political courage, and do something next session for the payment of the Roman priests. He must run some risk of shocking public opinion; no greater risk, however, than he did in Catholic Emancipation.

FEELINGS OF THE CABINET.

There is only one man in the cabinet [probably Mr. Gladstone, who is no longer there] who objects from reasons purely fanatical, because the Pope is the Scarlet Lady, or the Seventh Vial, or the Little Horn. All the rest are entirely of opinion that it *ought* to be done—that it is the one thing needful: but they are afraid of bishops, and county meetings, newspapers, and pamphlets, and reviews; all fair enough objects of apprehension, but they must be met, and encountered, and put down. It is impossible that the subject can be much longer avoided, and that every year is to produce a deadly struggle with the people, and a

long trial in time of peace with O'somebody, the patriot for the time being, or the general, perhaps, in time of a foreign war.

THE POLICY OF PAY.

Give the clergy a maintenance separate from the will of the people, and you will then enable them to oppose the folly and madness of the people. The objection to the state provision does not really come from the clergy, but from the agitators and repealers: these men see the immense advantage of carrying the clergy with them in their agitation, and of giving the sanction of religion to political hatred; they know that the clergy, moving in the same direction with the people, have an immense influence over them; and they are very wisely afraid, not only of losing this coöperating power, but of seeing it by a state provision, arrayed against them. I am fully convinced that a state payment to the Catholic clergy, by leaving to that laborious and useful body of men the exercise of their free judgment, would be the severest blow that Irish agitation could receive.

It is commonly said, if the Roman Catholic priests are paid by the state, they will lose their influence over their flocks. Not their *fair* influence—not that influence which any wise and good man would wish to see in all religions—not the dependence of humble ignorance upon prudence and piety: only fellowship in faction, and fraternity in rebellion—all *that* will be lost. A Peep-of-day clergyman will no longer preach to a Peep-of-day congregation—a Whiteboy vicar will no longer lead the psalm to Whiteboy vocalists; but everything that is good and wholesome will remain. This, however, is not what the anti-British faction want: they want all the animation which piety can breathe into sedition, and all the fury which the priesthood can preach to diversity of faith: and *this* is what they mean by a clergy losing their influence over the people!

The cost of his policy Sydney Smith rates at 400,000*l.* a year. It has been remarked by a writer, who had not read the pamphlet, or wilfully shut his eyes to its contents, that this was easy for a wit to say, who has not, like a chancellor of the exchequer, to find the money. But the wit had forestalled his critic, not only about the money, but something more.

"This is English legislation for Ireland!! There is no abuse like it in all Europe, in all Asia, in all the discovered parts of Africa, and in all we have heard of Timbuctoo! It is an error that requires twenty thousand armed men for its protection in time of peace; which costs more than a million a year; and which, in the first French war, in spite of the puffing and panting of fighting steamers, will and *must* break out into desperate rebellion."

THE LAST CONFESSION.

For advancing these opinions, I have no doubt I shall be assailed by Sacerdos, Vindex, Latimer, Vates, Clericus, Aruspex, and be called atheist, deist, democrat, smuggler, poacher, highwayman, Unitarian, and Edinburgh Reviewer! Still, *I am in the right*; and what I say requires excuse for being trite and obvious, not for being mischievous and paradoxical. I write for three reasons—first, because I really wish to do good; secondly, because if I don't write, I know nobody else will; and thirdly, because it is the nature of the animal

to write, and I cannot help it. Still, in looking back I see no reason to repent. What I have said *ought* to be done, generally *has* been done, but always twenty or thirty years too late; done, not of course because I have said it, but because it was no longer *possible* to avoid doing it. Human beings cling to their delicious tyrannies, and to their exquisite nonsense, like a drunkard to his bottle, and go on till death stares them in the face.

STANZAS TO ENGLAND.

When the curse Heaven keeps for the haughty came over
Her merchants rapacious, her rulers unjust.
And a ruin at last for the earthworm to cover,
The Lady of Kingdoms lay low in the dust.

MOON.

TOO LONG it hath been said and sung,
My country, unto thee,
Thy banner floats on every gale,
Thy keel ploughs every sea;
O'er every continent and isle
Thine influence is flung,
And not a spot on earth, but knows
The accents of thy tongue;
Not Rome had wider spreading sway,
Nor Greece, when Greece was young.

Too much thou hast exalted been,
Too much with pride of place,
Thou hast been led to overween
Thyself and all thy race;
Thou hast grown proud and arrogant,
While sitting like a queen,
With couchant lion by thy side,
Upon thy throne marine;
Not any one might say thee nay,
Nor come thy will between.

But what will Hist'ry say of thee
In some not distant day,
When broken is thy rod of rule,
And ended is thy sway;
When thou hast known decline and fall
As Rome before thee knew;
When Time for thee hath spread the pall,
And Death hath pierced thee through,
And reckoned is the great account
Where all must have their due!

How hast thou used the boundless power
That unto thee was given!
The seeds of good thou had'st to sow,
How have they grown and thriven!
The barren places of the earth
Hast thou like gardens made!
Do arid wildernesses smile
With green bough and with blade!
And doth the gospel sunlight shine
Where all before was shade!

Thou answerest, yea, the mental waste
Is now a waste no more;
My missionaries have gone forth
To every distant shore;
My merchant-ships have crossed the main
To civilize mankind;
No more the savage is a brute,
The heathen no more blind;
And broken are the chains which bind
The body or the mind.

'T is even so—thou *hast* done this,
And unabashed might'st stand

Before the judgment seat, but there
 Are red spots on thy hand,
 And Pride is throned upon thy brow,
 And Hatred in thy heart ;
 From many a fair and fertile realm
 Thou badest Peace depart ;
 And oft with words of brotherhood,
 Didst act a foeman's part.

How will the Hindoo testify,
 And how the brave Affghan,
 The dweller by the Yellow Sea,
 The red Canadian ?
 Will not thy sister Erin have
 A mournful tale to tell ?
 Will not accusing voices rise
 From Scottish height and dell ;
 And Cambria send a list of wrongs
 The catalogue to swell ?

Oh, thou hast run a mad career
 Of conquest and of blood ;
 A chequered record is thy past
 Of evil mixed with good.
 Too willing e'er to take offence,
 Too prompt to draw the sword ;
 Of generous heart and open hand,
 Yet smiting at a word ;
 With evil thoughts, and passions wild,
 Too readily upstirred.

Surrounding nations have looked on
 In jealousy and fear,
 To see thy wide possessions still
 Increasing year by year :
 They wait until thy lion's paw
 Hath a less nervous sweep,
 Till languor or decrepitude
 Have laid his powers asleep,
 For slights and fancied injuries
 To take a vengeance deep.

They watch, and not methinks in vain,
 Disgraces to retrieve ;
 The times are big with bodeful signs,
 Thy faithful sons to grieve ;
 Distress and Poverty combine
 Thy limbs to paralyze ;
 The voice of discontent is heard
 From all thy towns to rise ;
 Where famine goaded multitudes
 With wild shouts rend the skies.

Oh, let thine armies be recalled
 That pillage and lay waste ;
 Be just, be true, be merciful,
 Nor self-destruction haste ;
 Let equal laws be felt by all
 Who dwell thy sway beneath ;
 Unchain thy ports, let commerce be
 Free as the heaven's breath ;
 Or it may hap that, scorpion-like,
 Thou'lt sting thyself to death.

Look back to other times, and learn
 Deep wisdom from the past ;
 The reign of fraud and violence,
 When knew ye *this* to last ?
 Pride goeth e'er before a fall,
 God grant thine be not near !
 A people should be ruled by LOVE
 And not by slavish FEAR ;
 A nation that but forgeth chains,
 Perchance those chains may wear.
Tait's Magazine.

SLAVERY AND THE SLAVE TRADE.

It will be a most melancholy and disheartening though not a dishonorable tale, should history have to tell the failure of English efforts to put an end to slavery and the slave trade. It will be not only sad for the negro race, but for humanity, since it must throw a chill upon every kind of political measure or policy, founded upon religious or philanthropic sentiment. The Crusades are one great example of a policy, springing out of religious feeling, being gigantic, strenuous, continued, yet vain efforts to resist the torrent of fanaticism and conquest which rolled from east to west.

The flood of negro labor and population, which set across the Atlantic urged by the cupidity of Europeans, seems as great, as irresistible, as the tide of Mahommedan fanaticism. One is as abhorrent to Christian and humane feeling as the other, and Christian feeling was roused and tasked to combat both. Shall the tale of failure be told of both? Must Clarkson and Wilberforce be set down in the same Category with Peter the Hermit and St. Louis? And is it decreed that the African race shall fill all these central and southern regions of America, from whence the whites drove the Indians, in order to monopolize a soil which they could not cultivate, and to the tilling and final possession of which they were obliged to call in the African?

What hopes have we from the three modes of combating slavery, so zealously, so energetically followed? From that of converting the Africans themselves to habits and interests opposed to slavery and its emigration? From that of perfecting and extending the right of search, so as to render the sea passage too difficult or too great a risk for the trader? Or, finally, from that of inducing transatlantic states to forego slavery and the slave trade? Different sections of the public, or zealous individuals, may have different opinions respecting the efficacy or hopefulness of these modes. But there exists such a diversity that no common effort is any longer to be counted upon. The internal civilization of Africa is a scheme still pursued by a few, and we hear still of expeditions, and of a certain specific for fever, which is to work wonders: but the public and the cabinet remain incredulous. Lord Palmerston and most of the leading whigs pin their faith to the right of search; but the feeling hostile to it has risen even as high as his lordship's energy. People say, must French and English whites cut each others' throats in order that the blacks may be free? Piles of blue books remain as testimonies to Lord Palmerston's activity and success in negotiation; but like Cœur de Lion in the Crusades, the Saracen tide has still continued to rush on beyond the power of a single arm to stay such multitudes. Even the anti-slavery societies cry *Hold*.

There remains the hope of inducing slave-countries to forego their Helotism. Vain hope! if the English government could not preserve Texas from an influx of slavery, how can it hope to abolish what it cannot pretend even to limit. A Tory journal alleges that the American planter does not need any influx of African slaves, and that he dreads them. This may be true of the American slave-owner confined to Carolina or to the worn out soil of the old states, but with Texas annexed, and its immense seaboard within a few hours' run of Cuba, the American slave trade will in all human probability be resuscitated; and the only safeguard against it must be either in the

right of search or some efficient substitute. For negotiating with Mr. Polk on the subject could be nothing but derision.

But we are also told that the slave trade works its own cure, and that the time will come, or has come, when the affrighted planter in all countries will, in self-preservation, forbid the importation of a single slave. If so, have not all our labors been thrown away? Would we not have done better to have favored and facilitated the trade, rendering the transport more humane, in order to arrive sooner at the great consummation. This is, perhaps, the most melancholy conclusion that we could arrive at with respect to our past exertions. If this be true, we have been Quixotes and Crusaders with a vengeance. We doubt, however, the justice of the conclusion, as well as of the prophecy. As long as there are new tracts and virgin soils in North and South America, capital and adventure will extend and be applied to them, and these will bring the cheapest and most productive labor. If this labor be slave labor, no power will prevent the growth and extension of slavery. This can alone be combated by the approved success and abundance of free labor. Some have a horror of introducing one more negro, free or enslaved, into the tropical regions of America, and for very obvious reasons. But can we condemn these regions to sterility, when there is a race capable of rendering them fertile? Would we not, in so doing, be embarking in yet another of those Crusades which have baffled our zeal and wasted our best energies?

We see that the colonists of French Guiana offer to emancipate their slaves, if enabled to procure an ample supply of free labor, according to the plan proposed to the government by M. Jules Le Chevalier. A successful experiment of this kind would operate more forcibly both on the United States and on Brazil, than all the negotiatory power that Lord Aberdeen, even if backed by M. Guizot, could ever bring to bear. Without some warnings and incentives of this kind, neither Brazilians nor Americans will be brought, for this century to come, to a sense of what they owe, either to humanity or their own preservation.—*Examiner*.

INSTRUMENTAL VOTING.

THE Americans have a plan for voting by machinery. The member has two keys before him like those of a pianoforte, and he touches the aye note or the no note, and the corresponding word springs out of a slide, and is numbered by the speaker. There are many conveniences in this scheme, and by it an expression may be given to votes which is now wanting.

A member who has misgivings or doubts about his vote will give a shake upon the aye and no before he rests upon either. But the instrument should have more than the two keys; there should be the aye natural, (white,) and the no natural, (black,) and besides them there should be the no sharp and the no flat, the aye sharp and the aye flat, to assist the expression of the vote, and by the aid of these many appoggiatura flourishes might be executed in the division. For example, if a member feels that there are reasons for and against a measure, and is almost balanced in opinion, in that state in which honorable gentlemen are when they speak one way and vote another, by the help of the instrument he will first perform a quaver on the aye

sharp, pass to a crotchet on the no natural, execute a little shake on it and the aye sharp, and rest on the no flat.

The sort of doubtful choice which the Italians express by rather yes than no, and rather no than yes, would be exactly expressed by this instrument; the member touching the one note and then passing to the opposite and dwelling upon it a quaver or a crotchet longer, and then back again, and so on to the final rest. Many fatiguing see-saw speeches would be avoided by this use of the instrument.

The votes would be taken by a notation like that of music on music paper, with runs above the line or below the line, as the case might be. Additional keys would soon, we have no doubt, be invented, pedals appended for the swell in fiscal votes, and a thorough bass adapted.

The happy result will obviously be a great diminution of speaking, especially of that most unsatisfactory kind to explain a vote, the votes explaining themselves by their own organs, and a hundred wavering gentlemen will be seen shaking at once upon the aye and no, instead of occupying the house for a week in see-saw orations to show why they voted one way because they thought the other. The new gamut will thus happily put an end to much of the old gammon.

There will then arise the distinction of two classes in the house, the vocal and the instrumental performers, and much are we mistaken if the instrumental do not greatly obtain the public preference. The mechanical expression will be to the old spouting as railroad travelling to the superseded coach journeying, and a half-hour's speech will seem, by contrast, an intolerable oppression.—*Examiner*.

THE BEGINNING OF THE END OF REPEAL.

"Too weak for boys, too green for girls of nine."

FIVE hundred repealers are clad in green. What can resist such clothing?

Repeal first modestly set up a button, it has now got to a coat. As a button is to a coat, so, then, the present state of the repeal cause is to what it was five years ago.

Repeal has evidently a tailoring turn. The color of the uniform is well chosen. Green to the green. All who are green enough to believe in repeal will wear the color of credulity.

Mr. O'Connell is always talking of the greenness of Ireland, and her sons are certainly not less green than her verdure.

Now that green coats are put on, Mr. O'Connell declares that the repeal agitation has commenced in earnest. Commenced, why it was carried in '44 according to the authority of Mr. O'Connell. In the autumn of '43 was issued the promissory note for repeal three months after date; and now the cause is beginning again with a green coat. It is a farce finished one day to be repeated the next.

But can Parliament dare refuse to repeal the union, knowing the appalling fact that there are in Ireland hundreds of men resolutely wearing green?

The conciliatory stage has passed away, it was marked by the cap which Mr. O'Connell set at England. The cap, whether a wishing cap, or cap of maintenance, did not quite succeed; so recourse is had to the green coat, the *ultima ratio* of repeal.—*Examiner*.

MAYNOOTH AND OREGON.

19 May, 1845.

SIR R. PEEL observed, that all the feelings which had been excited in his mind during the course of this protracted debate were now merged in the all-absorbing hope that the house would not reject this measure. They might be of opinion that it ought to have been proposed by the original friends of Catholic Emancipation—they might think that government ought to forfeit their confidence for having proposed it at all; but he implored them, if they were determined to reject, or even to punish the men, not on any account to reject their measure. Could the house believe that ministers would have incurred the risk of forfeiting the confidence of the great party which they possessed, and of losing their own existence as a government, and even their seats as members of that house, if they had not been animated by a sense of public duty in proposing this measure to its consideration? He then proceeded to recapitulate the motives of government in proposing it, the ulterior objects which they hoped to accomplish by it, and the effects which it was calculated to produce on the mutual relations of Ireland and England. He showed that the question of Maynooth had been forced by circumstances upon the consideration of government, and that the government had determined in consequence to increase the grant to that institution in a liberal spirit. For the interest of peace, good order, and even of the Protestant religion itself, he believed that it was more important that he should commit the youth of Ireland to men who were contented with the liberality of the state, than to men who were disgusted with its institutions, because they were dissatisfied with its illiberality. He had been asked by Sir R. Inglis whether he had brought forward this measure as a part and parcel of a preconceived system to facilitate hereafter the endowment of the Roman Catholic religion as a state establishment in Ireland. To that question he replied by stating that this measure was brought forward singly and on its own merits—that it was not part of a preconceived system—that it was not designed to facilitate the endowment of the Roman Catholic Church in Ireland—and that he had entered into no communication with the recognized authorities of the Roman Catholic Church in Ireland or elsewhere, either directly or indirectly, upon that subject. He believed the Roman Catholic clergy were themselves averse to any such endowment, and he was convinced by recent occurrences that the British public were also averse to it.

As to Sir R. Inglis' question, whether at any future time, under circumstances which could not be foreseen at present, he would consent to the endowment of the Roman Catholic Church, he replied that he would not hamper any future government by a declaration that he believed that there were insuperable difficulties in the way of such an arrangement. Sir R. Inglis had further asked him whether he did not think that there were religious objections to such an endowment. He could not say for the sake of temporary popularity that there was any decided religious objection to it. He could not conceive it to be an offence in the eye of God to contribute to the support of a religion from whose tenets he differed. He did not see how Sir Robert Inglis could get over the arrangements which existed in our colonies for the support of a religion different from our own, and especially in Canada and the island of Malta. He thought that the religious principle for which Sir R.

Inglis contended was a dangerous one to establish even with regard to the established church of this country; for he should like to know how he would apply it to the payment of church-rates by dissenters, and to his own favorite scheme for church extension. He then proceeded to state that he believed this particular measure to be just to the Roman Catholic population of Ireland, and to violate no principle of the Protestant religion. As to its effect, he hoped that from the willing acquiescence in the vote now proposed, it would produce a kindly feeling in Ireland. It had been received with a grateful spirit in that country; indeed, he hardly expected in his most sanguine expectation that it would produce the effect which it had already accomplished. Every feeling in his bosom was on this occasion subordinate to his one great wish that this measure should not be rejected. He believed that it could not be withdrawn at present without wounding the feeling of every Roman Catholic in Ireland. He would not now defend it on the ground of compact—he would rather defend it as being in itself a wise, just, and amicable measure.

I say, without hesitation, you must break up that formidable confederacy which exists in that country against the British connexion. And I believe it is essential you should break it up, in order that you may carry on the work of good government in Ireland, [cheers.] and that you may strengthen the connexion between the two countries, and maintain, unimpaired, the power and dignity of the United Kingdom. [Renewed cheers.] On the horizon of the west there is a cloud [hear, hear.]—a cloud small but threatening future darkness. [Hear, hear.] While we were most anxious for an adjustment of the impending differences—while we would leave nothing undone to effect an amicable settlement [of the Oregon question]—yet I did feel it to be part of my duty—of the duty of the first minister of the crown—to state that, if our rights were invaded, we were determined and prepared to maintain them. [Loud cheers.] I aver that when I was called upon to make that declaration, I did recollect with satisfaction and consolation, that the day before I had sent a message of peace to Ireland. [Loud cheers.] The hon. gentleman, member for Canterbury, thought it not impossible that the time would come when this country would be compelled to summon all her energies for action. I heard that speech with great satisfaction. (Cheers.) Now may God avert so great an evil as war. [Loud cheers.] May God forbid that this time of general peace should be so awfully disturbed. [Hear, hear!] But if it is to be so, if war is to come, I doubt much, considering what is now before me [alluding to the opposition to ministers on this question] whether the vindication of our honor and our interests will not be confided to other hands. [Hear, hear, hear.] But to whomsoever they may be committed, I shall take my place beside them, encouraging them by any support I can give an honorable cause. [Loud cheers.] And if that calamity should befall us, it is my earnest hope that when it shall occur, it shall find the people of this empire united in loyalty to the throne and in determination to support the common interests. [Tremendous cheering.] That Ireland shall stand ranked with us. * * * And the energies of an united people will ensure a glorious triumph in a just cause. [The premier resumed his seat about three o'clock in the morning, amid thunders of applause which lasted several minutes.] Vote—for the second reading 323; against it 176.

A Treatise upon the Diseases and Hygiene of the Organs of the Voice. By COLOMBAT DE L'ISERE, Chevalier of the Royal Order of the Legion of Honor, Doctor of Medicine, Founder of the Orthophonie Institute of Paris for the Treatment of all Vices of Speech, Diseases of the Voice, etc. Translated by J. F. W. Lane, M. D. Otis, Broaders & Co., Boston.

COLOMBAT DE L'ISERE, a French physician, is the author of this work. He is known particularly in his own country for a marked devotion to the cure of the diseases of the organs of the voice, and as the founder, also, of an institution in Paris, called *orthophonie*. Dr. Lane, at the request of an eminent professor of elocution, and with a view to exciting more attention to a subject which seems not particularly well understood, undertook the translation of it. He has cautiously avoided all surgical details, and in simply following the author, has placed before the public a book of rare value, although so modest and unpretending in its appearance, that its real worth cannot be known without an examination. The chapter on chronic swelling of the tonsils, to a parent who for the first time is alarmed by the enlargement of those organs in his child, is worth more than the cost of the book. The simplicity of the style, and its freedom from technical language, fit it for common reading. Why should not vocalists, clergymen, members of the bar, and, in short, all public speakers, study this compendium, containing as it does so much that is truly useful respecting the anatomy, physiology, and diseases of the vocal apparatus? Pupils in singing schools, likewise, and in those institutions just growing into notice, in which gymnastic exercises are taught upon principles of common sense, might study it to advantage. But those especially who are engaged in elocutionary pursuits, would derive from its pages such insight into the philosophy and management of the voice, as could perhaps nowhere else be obtained in a form so compact.—*Boston Medical and Surgical Journal*.

THE CONSERVATIVE PARTY AND ITS LEADER.

THE new grant to Maynooth has been carried by the whigs. The conservatives have almost exactly divided upon the question, about 108 having stood by the premier, and about 104 having stood out against him. Of course, therefore, they go for nothing. They exhibit the infirmity of a house divided against itself; and are at the mercy of any external impulse. But the numbers of Thursday night are by no means a fair indication of the conservative sentiment on the present question. Even of the 108 who follow in the train of the triumphant premier, the greater part followed with folded, nay, with restricted, hands. They confessed themselves captives to ministerial necessity. The powers that be prevail. The fates hold every now and then their dread orgies, as poets and historians tell us, when all human scruples and calculations are overthrown, and men find themselves the passive instruments of uncontrollable power. For a time they have attempted to stem the tide of human affairs, and steer society by the ancient landmarks of opinion, and the consecrated chart of truth. At last a revolution, or a reform, or a coalition, overpowers in a moment the barriers of opinion, and lets in the flood of necessity. Such is the present crisis. The conservatives oppose in vain, support in vain. They have brought in a

minister to whom their friendship is worthless, their enmity contemptible. So they are drawn along with the stream. The whigs impregnate the inevitable progress of human affairs, and drag along Sir Robert Peel and half his supporters. They constitute almost exactly the excess of the majority over the minority of Thursday night. So it is they who have carried the grant to Maynooth. The conservatives are spectators of the event.—*Times*.

WHAT O'CONNELL SAYS.—There is one thing that is delightful—it was on Thursday he brought in the Maynooth bill, and passed it by a majority of 102; on Thursday he brought in that bill and made his conciliatory speech, and he immediately took advantage of it, and the very next day, Friday, he set the Americans at defiance, naturally feeling that he was strong in doing justice to Ireland (cheers)—and I tell him to go on in the same career, and we will set the Americans at defiance for him also. (Hear, hear.) At present the quarrel appears to be carried on by the Americans blustering away at one side, and Sir Robert Peel is now stoutly asserting at the other. They appear like two fellows in a rage with one another, and each of whom is held by his friends: "Oh, let me at him," says one—"Oh, let me at him," cries the other. (Laughter.) I say to Peel, don't be at him until you have secured the back of Ireland—do full justice to Ireland—give her the management of her own Parliament in College Green, and then attack any person that dares to look crooked at you. (Cheers.)"—*Examiner*.

THE REPEALERS IN HIGH SPIRITS.—The Senate of America has voted the Annexation of Texas. Texas wills the combination. The President has undertaken to execute it. Texas is, in fact, a State of the American Union. *England rages. Ha! gentlemen, where is Ireland now? You dare not fight, because Ireland is discontent.* James Polk has sworn to observe the Constitution of America, and has spoken his inaugural address to the States. *It was placid, profound, and determined.* Such a document has not been issued by a legitimate king these two centuries. *It is worthy of a usurper (!)—most worthy of the freely-chosen Magistrate of freemen (!)* * * * Well, Oregon, we suppose, is pretty certain of being annexed. Verily, these Americans are "making hay while the sun shines"—making States while Ireland is malecontent. *Canada will, we suppose, sympathize, declare, and annex soon;* though England, by granting independence to it and to Ireland, might keep Canada from uniting with her great competitor for the ocean. England might change two enfeebling and dangerous provinces for two profitable and lasting allies; *but she won't—her destiny is to be accomplished.*—*Nation*.

ON Sunday, Mr. Brunel travelled in the fast train from London to Exeter. The whole journey was performed in four hours and three quarters, including stoppages at Swindon, Bath, and Bristol. of twenty-two minutes; so that the actual time of travelling 196 miles was four hours twenty-three minutes. The greatest speed attained on the journey was seventy miles an hour; and at this apparently frightful velocity there was no unpleasant motion. Mr. Brunel declares, that if the directors would permit, he would undertake to perform the journey to Exeter in four hours instead of five.—*Devizes Gazette*.

From the Quarterly Review.

The Crescent and the Cross; or, Romance and Realities of Eastern Travel. By ELLIOT WARBURTON, Esq. London. 2 vols. 12mo. 1845.

WHEN the Persian ambassador in London saw Storr and Mortimer's shop, encumbered with its piles of jewelry, and gold and silver, he declared at once and decisively that the king of England was a mere nominal sovereign—a phantom—an empty pageant; for, said he, "if your Shah had in him a vestige of royal power, would he not naturally seize the immense treasures so coolly displayed before him in open day by these two insolent merchants?" And now it would seem that if England, on the death of Mehemet Ali, should be so inert, or so squeamish, as not to seize and occupy the famous land of Egypt, her virtuous abstinence will be viewed by Mr. Warburton very much in the same light as that in which the Persian ambassador regarded king George for sparing the silversmiths' shop. We shall presently endeavor towards showing that our national honesty, in leaving the possession of Egypt to its misbelieving owners, may possibly be justified even upon the humble and popular ground of expediency: but first we must speak of Mr. Warburton's book. It is an account of a tour in the Levant, including Egypt, Palestine, Syria, Constantinople, and Greece. The author frankly calls his work the "Romance and Realities of Eastern Travel;" and, to say the truth, the romance is so well imagined, and the reality so well told, that we can hardly affect to distinguish the one from the other. The book is vastly superior to the common run of narratives, and is indeed remarkable for the coloring power and the play of fancy with which its descriptions are enlivened. The writing is of a kind that indicates abilities likely to command success in the higher departments of literature. Almost every page teems with good feeling; and although that "catholic-heartedness" for which the author takes credit permits him to view Mahometan doctrines and usages with a little too much of indifference, yet, arriving in Palestine, he willingly becomes the good pilgrim, and at once gives in his adherence to the "religion of the place" with all the zeal of a pious, though much hurried, Christian. The book, independently of its value as an original narrative, comprises much useful and interesting information, derived from the labors of others, and collated in a manner the very reverse of pedantic. Amongst these materials, and strongly contrasted with the graver and more learned portion of them, is a clever and charmingly madcap letter from Mr. Walpole: it is just what a midshipman's writing should be.

Mr. Warburton's views upon various subjects are thrown out somewhat lightly; but in these portions of his book we do not read him as if he were solemnly conducting a discussion with a view of persuading his readers: it strikes us rather that he uses the seeming argument as a mere vehicle for lively and sparkling composition. Amongst the views thus hazarded is the one to which we have referred respecting the occupation of Egypt:

"Is the Porte," asks our author, "once more to extend its hateful authority over this unhappy country, with all the withering influence which it never ceases to exercise? Shall we replace the ignorant and fanatical followers of the Crescent in the province which became a kingdom through their imbecility, in order that they may interrupt

our commerce here, as they have been allowed to arrest the building of our church at Jerusalem?"

"Heaven forbid! When the old man who has bravely won this fertile province ceases to exist, let his selfish power perish with him. Let England not prostitute her influence to restore emancipated Egypt to the imbecile tyranny of the Porte; but endeavor to infuse into the country of her adoption the principles, together with the privileges, of freedom. Let her lay aside all double-dealing and mock-modesty—as disreputable in the case of nations as of individuals—and boldly assert her "right of way" through Egypt to India, while she leaves unquestioned that of France through Algiers to Timbuctoo.

"English capital and industry would make Egypt a garden; English rule would make the fellah a free man; English principles would teach him honesty and truth: and as to the comparative advantage of Turkish or English politics, let the world be the judge between Asia Minor and North America, between the influences of the Crescent and the Cross."—vol. ii., p. 46.

We will not seriously inveigh against a suggestion put forward as a mere piece of chat in the course of a traveller's narrative, but, thinking that the indulgence of national covetousness at the expense of friendly states is of itself an evil though never actually fulfilled, we would willingly chill this ardor for the spoliation of a Mahometan prince; and in order to inculcate moderation and good faith towards the Sultan, we know no better lesson than that which is to be taught by inviting a glance at the modern history, and the actual results, of French ambition in the Levant. Of course, this partial example of the difficulties and misfortunes that have frustrated the attempts of a particular nation will not of itself be conclusive against the adoption of a similar policy by other states. It will be auxiliary only, and not all-sufficient.

The old policy of Versailles, in reference to the affairs of the Levant, was conservative in its character, and so generally coincided with the views of England that events occurring on the further shores of the Mediterranean rarely furnished the two great rival kingdoms of the West with elements of discord. But all was suddenly changed when Bonaparte invaded Egypt, and coined a new phrase: the invasion failed—but the phrase still exerts its terrible energy; and as long as the relative strength of the great European powers shall remain divided in its present proportions, so long our navy estimates in every year to come will owe a great part of their bulk to the discovery of the "French Lake." It is to the Eastern shores of this famous water, and to their relations with France, that we now are turning our eyes. We will not look back to those remote and simple ages when the "Lake" was distinguished by the barbarous appellation of the "Mediterranean," but will begin with the spring, "year six" of the "one and indivisible republic,"—a time superstitiously described in our almanacs as "1798."

By the intermittent warfare from time to time recurring on the Hungarian frontier and the Lower Danube, the Ottoman empire, though harassed, and now and then thrust back to the foot of the Balcan, had not been made to feel the utmost prowess of even that half-foppish, half-warlike age which ended with the Brunswick Proclamation—still less of the mightier Europe that stood up braced and armed for the exigencies of the

French Revolution. The originally small, but daring, minority of men who resolved to create a republic for France, and maintain it against all foes at home or abroad, thought themselves constrained by the fierce necessity of self-defence to throw away all the old fetters that interfered with the full development of their energies. War had hitherto been a pastime, just dangerous enough to furnish excitement, but rarely menacing the actual existence of great states. Princes moving their armies had found themselves perpetually embarrassed by the supposed necessity of collecting great stores, and establishing magazines and hospitals on the line of march, for the sustenance and care of their soldiery: these troublesome and expensive duties were at once repudiated by revolutionary France; she furnished enthusiasm, heroes, and bayonets—all else was to come from her neighbors—from her foes, if possible; if not, from neutrals and friends.

In order to give full effect to the impetuous forces thus called into action, a commander was wanting who could direct without partaking the national enthusiasm. Frenchmen were too essentially a portion of the torrent to have the power of guiding it. France wanted a chief who could stand aloof from her in feeling, and yet give the nation full swing. Bonaparte had shown that he was the man. Associated with Robespierre's party, and even venturing a pamphlet in its support, he had never shared its fanaticism. At a subsequent period, indeed, he had so far lent himself to the government as to do it the favor of mowing down the insurgent Parisians with great completeness and skill; but his powerful intellect, and his inbred contempt of the French race, had saved him from becoming the obstinate partisan of any faction. Entrusted at length with the command of an immense gang, without jackets or shoes, but ready to fight for both, he had been able to make it into an army; and soon, the briskness with which he discomfited the periwigged lieutenants of the Aulic Council, no less than his unflinching firmness in plundering neutrals and allies, had raised his reputation to an intolerable height—to a height so great that the overshadowed Directory was glad enough to catch at any feasible plan for ridding itself of a too powerful servant. France at this time was at peace with continental Europe. England was the enemy of the young republic, and some persons conceived therefore that England should be the country to be attacked; but this scheme was quickly abandoned, as utterly wanting in originality, besides being dreadfully dangerous.

Now it happened that the youthful conqueror of Italy, fired by a history of Alexander the Great, had been poring over his maps, and had formed what the French gravely call "some gigantic ideas." The Americans say of a piece of news that it is "important if true;" in a like spirit we English habitually comment upon these schemes for wide conquest, and are ready to call them "gigantic," if only we can see that they are practicable. But in France this condition of possibility is less rigorously insisted upon; and when Bonaparte fell to dreaming, there was no one at hand both able and willing to wake him. It seemed to him in these visions that his strength was cramped by the narrow bounds of Europe. He would be an Oriental conqueror; and, accordingly, he went to the Directory, and asked if he might give "a sure blow" to England by attacking Asia and

Africa! Yes, he might. The further he went the better the Directory would be pleased; and whether he formed a junction with Tippoo Sahib or with the Prince of Darkness they did not much care. He seems to have really had *carte blanche* to attack almost any defenceless state. Might he invade the Ottoman empire on the side of Egypt? Certainly; for the friendly relations subsisting between the Porte and the French government rendered it likely that the attack would be wholly unexpected, and therefore, of course, the more sure to succeed. Might he, *en passant*, take Malta? The Directory faintly objected, that Malta had not only done no wrong, but had shown peculiar favor to the French by succoring their cruisers and merchantmen, and giving them opportunities for refitting: the scruple was soon overruled.

From the first conception of the Egyptian expedition up to the time of his failure before Acre, Bonaparte seems to have wavered between two very distant plans: one was to use the Eastern enterprise as a mere *coup d'éclat* for the augmentation of his personal fame, and to return to France after a few months with the view of pushing his fortunes in Europe; the other plan to which he looked was that of allowing himself six years to become an Alexander the Great *à la Française*. The concentrated selfishness of his views, and the ludicrously French contrivances by which he proposed to compass his ends, are well characterized by his own words. When asked how long he should remain in Egypt, his answer was—"Either a few months, or six years: all depends on events. I shall colonize the country, and import thither artistes, workmen of all sorts, women, comedians, &c. I am only now twenty-nine; I shall then be thirty-five; that is no great age; if all succeeds, six years will enable me to reach India." It seems, we think, clear that before the preparations for the expedition were complete, the strong sense of the possible Alexander had begun to disperse his illusory hopes of becoming an Oriental conqueror; and only a short time before the day of departure arrived he made another (his second) bold push for a seat in the Directory. The intrigue, however, failed; and with a somewhat ill grace, "Bonaparte, member of the Institute" was fain to set sail for the East with a well-manned fleet, and a cloud of transports, carrying on board some 36,000 of infantry and unmounted cavalry, besides cooks, actors, dress-makers, and a small brigade of brother-savans.

Malta was seized. In due time the fleet reached the shores of Egypt: a disembarkation was effected without opposition, and in a few hours the French troops were conciliating the natives by killing their wives in the streets of Alexandria. The slaughter was stopped at last by the interference of an Osmanlee, (probably a bachelor,) who negotiated a convention for putting the French in quiet occupation of the city. The main body of the army now crossed the intervening tract of sand by a painful march, reached the Nile, and ascended its left bank to within a short distance of the Ghizeh Pyramids. Here Mourad had hastily collected his resources. He had dragged to the ground some artillery, but without carriages; and in order, therefore, to neutralize the effect of guns thus "sitting in permanence," nothing more was necessary than to keep a little out of their range: the Bey had also a vast rabble of thoroughly useless pedestrians: the only real force which he possessed was a mass of some 9000 well-mounted

Mamelukes—men with no pretension to the qualities of regular cavalry, but agile and bold in their stirrups. With these he bore down on his foe. The French infantry, however, formed in squares, with the artillery at the angles, and the savans in the centre, were not to be broken and crushed by a throng of irregular horse: on the contrary, they mowed down the Mamelukes like grass, and the whole remaining crowd of Egyptians was easily dissipated. Bonaparte adroitly called this affair "The Battle of the Pyramids," and a few days afterwards he crossed the Nile, established himself at Cairo, and wrote to Tipoo Sahib (then nearly succumbing under the Wellesleys) to say he was coming to help him with a countless host of warriors.

A people continually subjected to oppression will generally accept a change of tyrants with a good deal of pleasure in the first instance. It appears certain that until the yoke of the invader began to be felt, the French were not unwelcome in Egypt. Their rapacity, however, soon forced the Egyptians to sigh for even a Mameluke government. All the old machinery of extortion employed by the Beys was seized and adopted by Bonaparte, and was worked with a severity more sure and methodical than that which characterizes the procedure of an Eastern oppressor. The people were vexed, and ground down. In that there was nothing new; but it seemed to them hard to lie under the heels of those odd-looking and seemingly frivolous infidels, instead of the stately and high-mettled tyrants to whom they had long been accustomed.

The success of an Eastern conqueror must depend upon his power of influencing opinion beyond the sphere of his actual military occupation. The tracts over which he must carry his dominion are so vast in proportion to the space physically clutched by an army, that unless its commander can make great conquests by the mere weight of his character, he can make no conquest at all. Bonaparte felt this; and he tried very hard to gain a hold upon the Oriental mind. He failed; partly no doubt by reason of the naval and military reverses which his forces sustained, but partly, too, from a want of the requisite high-mindedness, and from a defective knowledge of the Eastern character.

First and chief amongst the reverses to which we allude was the destruction of the French fleet in the Bay of Aboukir: the force with which this event operated against the fortunes of the invader, both by cutting off his resources and destroying the idea of his complete ascendancy, is too obvious to require illustration. But the event itself is told by Mr. Warburton with so much life and spirit, that we pause to extract his description:

"Having landed Bonaparte and his army, Bruëys lay moored in the form of a crescent, close along the shore. His vastly superior force and the strength of his position (protected towards the northward by dangerous shoals, and towards the westward by the castle and batteries) made him consider that position impregnable. He wrote, on the strength of this conviction, to Paris, to say that Nelson purposely avoided him. Was he undeceived when Hood, in the Zealous, making signal that the enemy was in sight, a cheer of anticipated triumph burst from every ship in the British fleet—that fleet which had swept the seas with bursting sails for six long weeks in search of its formidable foe, and now pressed to the battle

as eagerly as if nothing but a rich and easy prize awaited them?

"Nelson had long been sailing in battle-order, and he now only lay-to in the offing till the rearward ships should come up. The soundings of that dangerous bay were unknown to him, but he knew that where there was room for a Frenchman to lie at anchor," [to swing,] "there must be room for an English ship to lie alongside" [on either side] "of him, and the closer the better. As his proud and fearless fleet came on, he hailed Hood, to ask his opinion as to whether he thought it would be advisable to commence the attack that night; and, receiving the answer that he lounged for, the signal for 'close battle' flew from his mast-head. The delay thus caused to the Zealous gave Foley the lead, who showed the example of leading *inside* the enemy's line, and anchored by the stern alongside the second ship, thus leaving to Hood the first. The latter exclaimed to my informant, 'Thank God, he has generously left to his old friend still to lead the van.' Slowly and majestically, as the evening fell, the remainder of the fleet came on beneath a cloud of sail, receiving the fire of the castle and the batteries in portentous silence, only broken by the crash of spars and the boatswain's whistle, as each ship furled her sails calmly—as a sea-bird might fold its wings—and glided tranquilly onward till she found her destined foe. Then her anchor dropped astern, and her fire burst from her bloody decks with a vehemence that showed how sternly it had been repressed till then.

"The leading ships passed between the enemy and the shore, but when the admiral came up he led the remainder of the fleet along the seaward side—thus doubling on the Frenchman's line, and placing it in a defile of fire. The sun went down after Nelson anchored; and his rearward ships were only guided through the darkness and the dangers of that formidable bay by the Frenchman's fire flashing fierce welcome as each enemy arrived, and hovered along the line, coolly scrutinizing where he could draw most of that fire on himself. The Bellerophon, with gallant recklessness, fastened on the gigantic Orient, and was soon crushed and scorched into a wreck by the terrible artillery of batteries more than double the number of her own. But, before she drifted helplessly to leeward, *she had done her work*—the French admiral's ship was on fire; and, through the roar of battle, a whisper went that for a moment paralyzed every eager heart and hand. During that dread pause the fight was suspended—the very wounded ceased to groan—yet the burning ship continued to fire broadsides from her flaming decks, her gallant crew alone unawed by their approaching fate, and shouting their own brave requiem. At length—with the concentrated roar of a thousand battles—the explosion came; and the column of flame that shot upward into the very sky for a moment rendered visible the whole surrounding scene—from the red flags aloft to the reddened decks below—the wide shore, with all its swarthy crowds—and the far-off glittering sea, with the torn and dismantled fleets. Then darkness and silence came again, only broken by the shower of blazing fragments in which that brave ship fell upon the waters. Till that moment Nelson was ignorant how the battle went. He knew that every man was doing his duty, but he knew not how successfully; he had been wounded in the forehead, and found his

way unnoticed to the deck in the suspense of the coming explosion. Its light was a fitting lamp for eye like his to read by. He saw his own proud flag still floating everywhere, and at the same moment his crew recognized their wounded chief. The wild cheer with which they welcomed him was drowned in the renewed roar of the artillery, and the fight continued until near the dawn.

"Morning rose upon an altered scene. The sun had set upon as proud a fleet as ever sailed from the gay shores of France: torn and blackened hulls now only marked the position they had then occupied; and where their admiral's ship had been, the blank sea sparkled in the sunshine. Two ships of the line and two frigates escaped, to be captured soon afterwards; but within the bay the tri-color was flying on board the Tonnant alone. As the *Theseus* approached to attack her, attempting to capitulate, she hoisted a flag of truce. 'Your battle-flag or none' was the stern reply, as her enemy rounded-to, and the matches glimmered over her line of guns. Slowly and reluctantly—like an expiring hope—that pale flag fluttered down from her lofty spars, and the next that floated there was the banner of Old England."—vol. i., p. 45.

After the battle, Nelson, heroically trustful in the honor of a valiant enemy, restored to the French prisoners all their property, and sent them ashore, to the number of some thousands, upon their word of honor not to bear arms until regularly exchanged: he thus gave to the French commander an opportunity of soiling his name, and lowering (among strangers) the character of the republic. The opportunity was not neglected, for Bonaparte at once set honor aside, and drafted into his regiments the men set free upon parole.

Admitting the vast effect necessarily produced upon the mind of the Orientals by the destruction of the French fleet, we still think that Bonaparte's failure (we speak always of his failure to win over public opinion) arose in great measure, from his own errors of conduct. This is a salutary and pleasant deduction to make. It is delightful to see failure resulting from crime—to see that the guilty being who has just been condemned by all good men on account of his delinquencies, must afterwards stand to be sneered at by the mere politician, because those very delinquencies were blunders in a temporal sense. If we try Bonaparte by the most worldly of all moral standards—namely, by the canon which tests—not the virtue, but the mere personal dignity of a man—we shall find him wanting even there; for not to him belonged those qualities which spring from a high self-respect. All his life long he boasted and lied. That he was callous to the sin of falsehood, we have hardly a right to wonder: that he never shrank from the *meanness* of the vice is a fact fatal to the completeness of his character as a hero—fatal, even, as we believe, in the end to his temporal success. The biographers of Napoleon love to tell how with the imperial diadem there came to him a taste for imperial pastimes—how he, who in his youth had spurned all sorts of recreation, could afterwards delight in the royal *chasse*, and listen to palatial music. But he never became too proud to soil his lips with falsehood. The General, the First Consul, the Emperor, and the "Exile Sublime," (as M. Thiers calls him,) were fair rivals the one to the other in the craft and mystery of lying. In all commanders, no doubt,

warlike feints, and even some sorts of political stratagem are fairly admissible; but it was in far humbler kinds of deception that Bonaparte indulged; and it is our conviction that by thus debasing himself before the Orientals he forfeited the power to rule them.

A sufficient acquaintance with the people of the East would have taught the Corsican Alexander that, in one who seeks to gain an influence over their minds, the most fatal of all possible mistakes would be that of exhibiting symptoms supposed to indicate fear, or doing any act of real or apparent self-humiliation. Now Bonaparte had scarcely set his foot upon the shore of Egypt when he committed both these errors. In his letters to the Grand Signor he contented himself with saying that the French had always been friends of the sultan, "even before they renounced the Messiah;" but immediately upon possessing himself of Alexandria, and even before he could get at the day of the month according to the Mahometan calendar, he dictated his famous proclamation under date of the blank day of the month Muharrem, in the year of the Hegira 1215. This precious appeal to the Oriental mind contained the following passages:—"People of Egypt! they will tell you that I come to destroy your religion. Believe it not! Answer that I come to restore your rights, to punish the usurpers, and that I respect more than the Mamelukes do, God, his prophet, and the Koran. Cadis, sheiks, imaums, scorbudgis tell the people that *we are true Mussulmans*.* Is it not we who have destroyed the pope, who said it was necessary to make war with Mussulmans! Is it not we who have destroyed the Knights of Malta, because those madmen pretended it was the will of God that they should make war against Mussulmans?" And again—"All the Egyptians shall be called on to fill all the offices of state. The wisest, the most instructed, the most virtuous shall govern—and the people shall be happy!"

The ill effect of this proclamation must have been greatly increased when Bonaparte submitted to the personal humiliation of joining in the Mahometan worship. He denied at St. Helena that he had ever gone so far, but upon this point he failed to win belief even from his apologists. Thiers says expressly, that "Bonaparte went to the great mosque, seated himself on cushions cross-legged, like the sheiks, and repeated with them the litanies of the Prophet, rocking the upper part of his body to and fro, and shaking his head. All the members of the holy college were edified by his piety."

It would have been hardly possible to devise a line of conduct better fitted to inspire the natives with a contempt for their invaders. Frenchmen were understood in the East to be really Christians: the effect produced by the encyclopædists and the revolutionary ferment upon the once religious mind of France was not of course understood or even heard of on the banks of the Nile;

* Thus the words are given by Thiers and other historians. According to Bourrienne, however, the words "des vrais Mussulmans" were preceded by "amis—" "We are friends of the true Mussulmans." The interpolation of this word would of course totally alter the purport of the sentence. It seems probable either that Bourrienne (the private secretary of the General) relied on his rough draught of the proclamation, or else that Bonaparte introduced the word "amis" in the French copies merely, with the view of concealing from Europe this shameful profession of faith.

and certainly the whole population of Egypt (especially the Mahometans, who so closely associate apostasy and defeat) must have felt disdainfully towards the invader when they saw him thus faltering in his reliance upon bayonets, seeking a base safety in the renouncement of his fathers' creed, and pretending a humble respect for Mahomet and his rignarole volume.

Then the promise to commit the government of the country to "the most wise, most learned, and most virtuous of the Egyptians!" Why, the attempt to fill one's game-bag by promising the partridges a representative government would be equally successful. As to Bonaparte's schemes for gaining an influence over the natives by interesting and amusing them, these were all of a kind so thoroughly and exclusively French that their failure would have appeared at once absolutely certain to any one conversant with the East. Sometimes a fête would be given, (as, for instance, on the 1st day of the Republican year VII.,) at which "the Mussulman flag was made to float along with the tricolor; the Crescent figured by the side of the Cap of Liberty; the Koran served as a pendant to the Rights of Man." "The Turks," says Bourrienne, whom we are quoting, and who really seems to have had some insight into the Oriental character, "were very insensible to these things." On another occasion Bonaparte called the *savans* to his aid, and endeavored to impress the people by a display of chemical experiments, which M. Berthollet was to perform in the presence of the assembled sheiks. The general waited to enjoy their astonishment; but the simple instinct of the Egyptians disconcerted all his attempts upon their marvelling faculties. The miracles of the Institute—the transformation of liquids—electrical shocks—galvanic batteries—all failed to produce the slightest symptom of surprise. The sheiks looked on with imperturbable coolness and indifference. When M. Berthollet had concluded, the sheik El Bekry said to him, through the interpreter—"All this is very well; but can you so order it as that I may be here and at Morocco in the same instant?" Berthollet answered (of course) with a shrug of the shoulders (*en haussant les épaules.*) "Ah! then," said the sheik, "you are not a complete magician."

So slight was Bonaparte's influence over the minds of the Egyptians, that not many days after the Battle of the Pyramids, parties of Arab horsemen were boldly careering and cutting down French soldiers under the very windows of the commander-in-chief. Some few weeks afterwards the imaums from the top of the minarets, instead of calling the people as usual to their prayers, invited them to rise up and destroy the "infidel dogs." This call was heard; and the revolt of Cairo soon showed that the military successes of the Republican General had brought with them none of that spirit-quelling respect by which they are usually followed in the Eastern world. Bonaparte (whose military genius never perhaps showed itself more decisively than in the perplexing trial of a street battle) put down the insurrection most skilfully, and punished it with unrelenting ferocity. The wholesale massacre by grape and round shot, after continuing for two days and killing 5000 persons, was succeeded by the work of the executioner; and it is curious that in his mode of conducting these in-door operations Bonaparte followed the plan of his old patrons the Terrorists, whom he afterwards abused so industriously. In

both cases the common and every-day orders were, not for the immolation of such and such victims, but for such and such a number of them; the head destroyer in both cases gave in his requisition fixing the quantity of human sheep that he wanted slain, and the task of selection was left to the mere working butchers. Several chiefs were killed daily, but it was not only Hadgi This, or Mustapha That, whom Bonaparte condemned to death; for besides the leaders, "thirty head" ("*une trentaine*") were executed every night. Many women were thus coldly slaughtered. The exact number of the merely obscure victims (the *trentaine*) is expressly stated by Bonaparte in his letter written to General Reynier, six days after the reestablishment of tranquillity. The executions are there spoken of as still continuing. It appears to us that Bonaparte's written account of the numbers thus put to death must be accepted as good proof; but it is fair to say that Bourrienne (deeming it almost impossible for his grandiloquent patron to make *any* unexaggerated statement) suspected that the general displayed some little ostentation in the account of his performances (*qu'il y mettait du luxe.*)

Now and then, of course, opportunities for smaller massacres would occur. On one occasion a Frenchman had been destroyed near a village at some distance from Cairo. Bonaparte, still mimicking Eastern conquerors, would have his revenge, not simply on the guilty person, but on the unfortunate village to which he belonged. Its men were to be all killed; its women and children to be driven away like cattle. Of the women, some sank on the road in the pains of childbirth; some dying by grief, by terror, by weariness. Many children, too, fell down and died. The extirpating force returned; and at four o'clock in the sunny afternoon a string of donkeys that formed part of its train wound along into the principal square of Cairo. There the party stopped—the beasts were unladen—the sacks, when detached from the pack-saddles, were untied—and out were rolled whole scores of ghastly heads; some with beards thickly matted in gore—some youthfully smooth.

It is, we fear, but too true that the Oriental mind is deeply impressible by this kind of wholesale slaughter. Bonaparte then had fulfilled two of the great conditions by which Eastern dominion is attainable; he had achieved splendid and decisive military success—he had perpetrated the requisite amount of atrocities with unshrinking perseverance. Yet his fame was barren—his cruelty wasted. No masses of men declared for him—no fortified places surrendered to the magic of his name. His power stood always limited within the range of his guns.

Now to all who understand the character of the Orientals—who know that strange facility with which they bend under successful violence—the bare fact of a man's winning battles, and yet lacking influence, must seem a most rare phenomenon, well deserving to be explained and accounted for. Upon some of the causes to which this strange result is attributable we have already remarked; but of all the general's errors (with the single exception of his apostasy) there was none perhaps so fatal to his influence in the East as his practice of vain-boasting. He was grossly deceived when he supposed that he would find in the East a credulity comparable to that of the French. The Oriental possesses a quality easily confounded with credulity, but totally distinct from it. The

weakness to which we point is a liability to be extravagantly impressed by a fact, and to deduce from it a greater brood of corollaries and consequences than the cooler judgment of the European would admit. The Orientals, for instance, see (a trifling matter may serve to illustrate national character)—they see an English traveller crossing the wilderness with his handful of ill-armed attendants; they see him maintaining his coolness, his wilful habits, and even perhaps enforcing compliance with many an odd silly whim—and all this in the midst of strange and armed tribes who are the terror of the peaceable natives; instantly they infer far more than the bare fact would warrant; they will not believe that a mere firman from a sultan, or a mere safe-conduct from a chief, could warrant all this assurance—and they therefore impute to the self-protected stranger either some infernal aid, or else the possession of unknown temporal resources that guard him completely from danger. So, again, they see a man, sprung from small beginnings, become, they know not how, the commander of an army; they see him so wielding his force as to confound his enemies, and bring down to the dust some ancient dynasty of kings—dazzled and stupefied, they bow their necks before all this exhibited strength, and acknowledge in the conqueror a being whom none can resist—a "Man of Destiny"—a "King of kings"—a "shadow of God upon earth."

But in neither of these instances is the effect produced by talking. In both it is the witnessed fact that lays hold of the Oriental mind. If either the traveller or the conqueror were to say of himself that which the natives would otherwise be ready enough to say of him—if the traveller were to bawl out that he is powerfully protected,* or the conqueror that he is an irresistible hero—the spell, so far from being thus worked effectually, would be utterly broken. Bonaparte's false nature, and his habit of lying to Frenchmen, carried him headlong into this error. He knew that the Orientals in all ages had been played upon, and he thought that false words (as in France) were the proper tools for deceiving. He accordingly maintained and enlarged his accustomed system of misrepresentation respecting military matters. He did more. He wanted to be thought an invincible hero; a man specially marked out by Providence and fate for the conquest of the East, and therefore—with a naïveté vastly amusing—he began to say of himself just that which he was so anxious for the wondering nations to say of him. Gravely, therefore, and pompously he announced himself to the assembled sheiks of Cairo as the "Man of Destiny," to whom was plainly committed the empire of the East. No one saw the sheiks smile: their beards and moustachios would veil any little play of countenance to which they may have yielded—but, in truth, the Oriental is little prone to the indulgence of humorous scorn. He looks upon weakness and folly as qualities to be freely taken advantage of rather than to be laughed at. So, then, with serious delight, rather than in a spirit of ridicule, the sheiks must have heard this announcement. From such vamping they would rapidly infer that the commander thus pressing vain words into his service could not stand, serenely relying upon his military resources; and, moreover, that he was wanting in that pride and

sense of personal dignity which they associate with the character of a predestined conqueror. Freely, therefore, and gladly enough they would now pretend to honor him with the flattering nickname of Sultan Kebeer, (Sultan Fire,) because they could presently go off to the baths, and there delight their friends with sly and quiet allusions to the weakness of "Sultan Smoke."

No vain-boaster like this is the true Eastern conqueror: he hears his praises sung—not from his own proud lips, but by the voice of prostrate nations. His words are few, ambiguous, pregnant with fate, as the words of an oracle. Of his very frown he is so sparing that, when it comes, its import is death, the razing of a city, the devastation of a province. Not to save half his army, nor all his stores, would he endure to be an utterer of bootless threats, lest men begin to whisper, and say that there are bounds to his power. When this sort of hero advances in eastern lands, the terror of his name stalks darkly before him—the strong places fall as he comes—the armies of his foe break and crumble—Panic sweeps them away in its blast; and whole tribes of warfaring men desert their ancient chiefs that they may follow in the train of a conqueror. No wonder-working renown of this kind was achieved by Bonaparte. When he had passed the desert at the head of all his disposable forces, he found that he could no more procure undisputed occupation of the miserable fortresses lying on the southern frontier of Syria than if he had commanded a mere corporal's guard. He was absolutely forced to "besiege" that wretched El Arish, and gravely "sit down" before Jaffa.

The bare name of Jaffa recalls to every mind the fate of the prisoners there taken. The massacre of those men was at first believed—was afterwards treated as a mere squire's story, incredible except to minds confounded by the din of war, and stupefied by country air. Its truth is now beyond doubt, and the grounds suggested as excusing its perpetration have failed. For the crime there is no palliation: for the chief criminal it is only to be said that his guilt was shared amongst the members of the council of war, who all joined with him in an unanimous vote for the massacre. We advert to this frightful act, not on account of its mere atrocity, but because it was perpetrated under circumstances which bring it within the scope of our observations on Bonaparte's want of faith in dealing with Orientals. The facts stand thus:—When the assault had succeeded, and the town was in the hands of the French soldiery, Bonaparte sent his own aides-de-camp, Eugène Beauharnois and Croisier, into the town, with orders to "appease the fury of the soldiery"—(or, as they stated in the presence of Bonaparte, and with his assent, to "appease the carnage")—"to see what was going on, and come back and give him an account." These officers found that a large portion of the garrison, consisting chiefly of Albanians, had taken refuge in a mass of buildings formerly used as caravanserais: they therefore went thither, each carrying on the arm his aide-de-camp's scarf. The Albanians cried out from the windows, and said that they would surrender if their lives were guaranteed them; if not, they would defend themselves to the utmost, and would shoot the two aides-de-camp. Beauharnois and Croisier, thus menaced, acceded to the terms offered, and brought back the Albanians, to the number of 4000, as prisoners of war. In two days

*Sagacious and experienced dragomen attending upon travellers in the Ottoman empire will never display the firman except in a case of extreme necessity.

These men felt in its bitterness the folly that they had committed in trusting to the word of Bonaparte's aides-de-camp. They were brought out in mass upon the beach, with their hands tied behind them—and into this living and human heap the French troops poured their volleys. All were slain except some few, who, in the agony of coming death, contrived to burst the cords that bound them. These rushed down into the sea, and swam out to the coral rocks which rose above the water at some distance from the beach. The French soldiers—hitherto the mere instruments of their leader's crime—now personally took upon themselves the guilt of fresh treachery and innocent blood. They called out to the prisoners on the rocks, and made them a sign well known in the country implying peace and forgiveness. The wretches, thus enticed, returned to the shore—then were shot.

False men are strangely slow to learn that they have forfeited the privilege of creating belief by word of mouth. Bonaparte still thought that he might promise and vow with success. Some few hours after committing the hateful treachery just related, he repeated his solicitations and promises to Djezzar Pasha, then commanding at Acre. Bonaparte had written to this man before he quitted Egypt, but the fierce old "butcher" (for that is his interpreted name) had met his advances with insult and utter disdain. Yet the mock Alexander—thus scorned and defied—had so scanty a knowledge of the Oriental character, and had so little of the heroic pride and self-respect which might have served him instead of knowledge, that now, at Jaffa, and on the 10th of March, he wrote to the old Turk a sort of begging letter, pressing him to become his "friend." It is, perhaps, almost necessary to know the Oriental character in order to appreciate the exultation with which this proof of weakness must have been received by the Pasha. Djezzar may, probably, have had some difficulty in making his people believe that a letter, involving a political blunder so enormous, was actually genuine; but, supposing that he could succeed in getting the authenticity of the document well credited, its influence in inspiring the garrison with resolution must have been immense. Bonaparte's application was treated, of course, with towering disdain. The unfortunate Frenchman who bore the letter was decapitated—his body given to the fishes—his head kept for amusement; and the fraternizing general now found that, in order to get a glimpse of his long-sought "friend" Djezzar, he must condescend to sit down before Acre, and patiently open his trenches.

There was much slovenliness, ill management, and want of vigor in the conduct of the siege. Just at first, too, Bonaparte had nothing but field artillery; but such of the heavy guns as had escaped the English cruisers at length arrived, and a breach was effected. Meantime, however, an event had occurred which, under ordinary circumstances, would have ensured the fall of the place without an assault. The Turks, collecting an army of some 15,000 cavalry, and a like number of foot, had crossed the Jordan. With a single division Kleber encountered this force, and, throwing his troops into squares, he found himself able to baffle and shatter the masses of cavalry that came down, pouring round him for six successive hours. At the end of that time Bonaparte came up with fresh divisions, and attacked the

Turkish reserves, as well as their front and one of their flanks. Kleber deploying took the offensive, and a brilliant victory was gained—a victory rendered decisive and bloody by Murat's seizure of the only bridge which opened a way for retreat to the eastern side of the Jordan. Now it is a maxim in war that, when a besieging force encounters a relieving army and defeats it, the strong place, however great its resources, will almost certainly fall. But Bonaparte's vain boasting—his display of mean spirit in the application to Djezzar, and other like indications of weakness—had so entirely deprived him of the hero's prestige, that not even victory, splendid though it were, could now carry power along with it.

At this time the French commander, though displaying less than his usual vigor and ability in the conduct of the siege, was fertile enough of "gigantic projects" for taking advantage of the expected capture when effected. "I shall find in the town," said he, "the treasures of the pasha, and arms for three hundred thousand men. I'll raise and arm all Syria, so indignant at the ferocity of Djezzar. I'll march on Damascus and Aleppo. I'll swell my army as I advance in the country with all the malcontents. I'll announce to the people the abolition of slavery and the tyrannical government of the pashas. I shall arrive at Constantinople with armed masses. I'll upset the Turkish empire. I'll found in the East a new and grand empire which shall fix my place in posterity; and perhaps I shall return to Paris by Adrianople and Vienna, after having annihilated *en passant* the House of Austria." Now we believe it would be difficult to assign any limit to the capabilities of a well-disciplined French army rapidly marched through countries without any other defence than that which Asiatic hordes can furnish; but the most superficial acquaintance with the subject would enable any man to see that Bonaparte's prospects of gaining a moral influence over the people were completely illusory. His notion, for instance, of advancing his cause by the abolition of slavery was ludicrous. The measure of course would have been viewed as confiscation by the owners of the slaves; and who would have been the people to profit by the proposed manumission?—Why, a number of black domestics, more fat than pugnacious, and thoroughly unused to arms as well as to freedom, besides a few women from Georgia and Circassia, already rooted to the harems of their owners by all the ties that can make home dear to wives and mothers. It is amusing, too, to see that at this period Bonaparte, having failed to win the respect of the Mahometans, showed some little hankering after the before-despised Christians; but chiefly he seems to have relied upon the Druses, for he fancied that their ambiguous religious position, as men neither good Christians nor good Mahometans, must dispose them to fraternize affectionately with his armed philosophers. Fancy the sympathy between a portly Druse of the Lebanon and a grimacing member of the Institute! And here we may remark (for the topic is not so trivial as it sounds) that the manner and personal appearance of the Frenchman must always obstruct him seriously in his attempts to gain an influence over the Orientals. All Europeans, no doubt, (we of course treat Turkey as Asiatic,) labor to some extent under this inconvenience; their ugly prim dresses, their quick anxious movements, their comparatively awkward gait and humble bearing are fitted.

to draw upon them the contempt of a people who habitually display their self-respect by the external signs of decorous dress, and calm, dignified manner. But a Frenchman is the superlative of all this uncomeliness. As we should show to a child a convict at work in his gaol dress, and say, "that it is to be wicked!"—so a bigoted Mussulman, if he wished to inspire his boy with an early hatred and contempt of Europe and Christianity, would pick out the smartest Frenchman he could find in the streets of Pera and say, "My child, look there!—if ever you were to forget your God and the Prophet, you might come to look like that!" But even supposing that there were no antipathies of this sort to conquer, still nothing could be more vain than to suppose that because Bonaparte's loose conscience enabled him to sham any form of worship he chose, he could therefore procure a religious following either from the Mahometans, or the Christians, or the Druses. It is a phrensy, and not a cold lie, that gathers together an army of fanatics.

A more immediate prospect, which cheered the republican general, whilst waiting for the result of his siege, was the ready surrender of Damascus. He was to have the keys of that place the moment he had hoisted the French flag on the citadel of Acre. Of course he was. It is a proverb in Syria, founded upon the constant result of the many tussles for that country, that whoever wins Acre, wins not only Damascus, but all the cities and all the plains of Syria and Palestine. But Bonaparte's vanity and limited knowledge of the people with whom he was dealing, quite blinded him to the emptiness or waggery of the offer.

A sufficient breach was at last effected, and now the result of the siege would chiefly depend upon the valor and obstinacy of the contending forces. Bonaparte, therefore, in his despatches to Egypt, treated the capture of the place as certain, and even named the day on which it was to receive the republican flag. He was ignorant of the staunch courage which the Ottoman soldier displays when fighting hand-to-hand in the breach. The truth is, that in such situations a brave man for once enjoys those opportunities of displaying individual heroism, from which in the open field he is so often and so provokingly debarred by the European system of discipline. Then too the besieged had their energies directed with admirable skill and judgment by Philippeaux; and, moreover, they found a good comforter in Sir Sydney Smith, who, landing a number of his officers and men, inspired the whole garrison with something of the cheery spirit and boldness that belong to the English seaman. Seven assaults were made, and all failed: at the eighth assault, as many as two hundred Frenchmen gained a footing within the works, and reached the pasha's garden, but not being supported with that vigor and promptitude which could alone bring about success, they were cut to pieces. This was Bonaparte's last attempt. "That man," said he at St. Helena, speaking of Sir Sydney, "made me miss my destiny." However, there was no help for it: the general could not afford to lose more men, and must perforce renounce the Empire of the East. He retreated; and his discomfiture, in the judgment of the natives, brought heavy disgrace upon the French arms. Many a man in Syria, to this day, who never heard of Napoleon the Emperor, yet remembers the vanquished foe

of old Djezzar Pasha. However, the general's power of falsifying rose with the occasion; the disgrace sustained was so great, that triumphant indeed must be the tone of the address to the army:—

"Soldiers!" said this document, "you have accomplished your destiny: after having, with a handful of men, maintained the war in Syria, taken forty pieces of cannon, fifty standards, and six thousand prisoners, razed the fortifications of Gaza, Jaffa, Caffa, and Acre, (!) we are about to reënter Egypt: the season of disembarkation commands it. A few days more, and you would have taken the pasha in the midst of his palace; but at this moment such a prize is not worth a few days' combat."

So the soldiers were to believe that, by having perforated a small aperture in the walls of Acre, they had "razed" its fortifications, and that they had really achieved the grand object of the siege, though they failed to carry the breach! One of the French chroniclers, however, pretends that there were several men in the army so highly gifted in point of good sense and sagacity that they actually detected the falseness, and even the absurdity, of this address.

The elaborate lying of the bulletin was not the only consolation of the retreating general. Before the retrograde movement commenced, Bonaparte had imagined a new atrocity: following up the now familiar line of policy adopted by the French, he determined that if he could not hurt his enemies, he would at all events hurt neutrals or friends. It does not appear that the people of the country along the coast from Acre to the desert had ever seriously harassed or vexed the march of the French troops. The garrisons, indeed, manned by Osmanlis and Arnaouts, had held out, and the warlike and bigoted population in the neighborhood of Naplouse had given some trouble—but it was not on these that the vengeance was to fall. "I'll destroy everything," said Bonaparte, "home to the commencement of the desert. I'll make it impossible for an army to pass in this direction for the next two years. It (i.e. an army) does not live in the midst of ruins." The season of the year (for it was May, the time of ripe grain immediately preceding the harvest) but too well favored this campaign against the fruits of the earth. Destroying parties were organized with as much regularity and system as if they had been formed for foraging: they were armed with torches. Every village—nay, every poor laborer's hut lying upon the condemned tract of country—was destroyed; and across the whole belt of fertile soil that runs parallel with the sea-shore the yellow fields blazed. And day by day this vast conflagration moved steadily on upon the left of the retreating columns; so that when Bonaparte once more set foot upon the verge of the desert, he left the fair province that had fed his army for the last three months now smoking far and near with ruined homes, and black with the ashes of corn.

But whilst devastation thus flanked the march of the French troops, the plague stole into their ranks. This calamity is one that always develops a new source of difference between the Oriental and the European. The former meets the risk of infection with serene composure: the latter, believing plague to be propagated by contact, is perpetually seeking to shun the peril, and is therefore regarded by the Moslem as a poor fugitive, miserably hoping to baffle the will of God by human

shifts and contrivances. The habitual materialism of the Frenchman seems to render him even more alive than other Europeans to the importance of avoiding contact in time of plague. Upon the retreat from Acre this anxiety of the troops to avoid the touch of infected substances grew to such a height as to destroy the bonds of good comradeship. Many a poor fellow, as he lay writhing to death upon the ground, would cry out, piteously—"I am not a *pestifère*—I am only wounded;" and to convince his comrades of this, he would reopen his gashes, or even inflict upon himself fresh wounds. "No one believed him. The men said—He is done for' (*son affaire est faite*)—then passed on, felt to know if their own glands were free from the fatal swelling, and all was forgotten." This abandonment of the sick and wounded must have been viewed with great scorn by the pursuing Turks.

Bonaparte's biographers make much of their hero's resigning his horse to the sick and wounded, and marching on foot. It is almost provoking to see that even this small piece of self-sacrificing heroism was a mere *coup de théâtre*. It was during the halt at Tentoura, on the 20th of May, that the order requiring all beasts of burthen to be given up for the sick and wounded was issued. When the general was about to move on, one of his grooms asked which horse he would ride: he answered by giving the poor servant a violent slash across the face with his whip, swore a fierce oath, and said that he should march on foot. He no doubt did so—perhaps for half an hour, perhaps for a day; but during the night-march of the 23d, (when the want of beasts of burthen must have been just as pressing as it had been on the 20th, and in all probability much more so.) Bonaparte was fired at by a peasant. This event incidentally brings out the fact that the pretended magnanimity of marching on foot had not been persevered in, for we are expressly told that when the shot was fired the general was asleep on his horse.

Another favorite story of Bonaparte's biographers was that of his touching the swellings of the plague-stricken patients in the hospital of Jaffa. This is a fable. The general, indeed, entered the hospital; walked rapidly through the rooms, switching his boot-top with his riding-whip, and desiring that those who were strong enough would get up and march, as the place would soon be occupied by the enemy. The plague-stricken patients were all too far gone to take the least notice of the speech addressed to them. There were not, it seems, more than sixty of them. An order was issued (it is hardly now matter of doubt) for administering to these patients "a potion adapted to accelerate death." A draught of this sort in the terse idiom of England would be called simply "poison." We, however, will not undertake to say that Bonaparte, in giving this direction, was not influenced by a motive which he thought humane. Moreover, it seems highly probable that his order was never complied with, and that the patients were left to their fate. There is much weight in the suggestion of Savary, who observes that the sick were all too far gone to take the potion voluntarily, and that no Frenchman would have incurred the risk of infection by administering it.

The remains of the army passed the desert, and returned in miserable plight to Cairo. Bonaparte heralded his arrival by a bulletin so tran-

scendent in its falsehood that for a moment his very secretary refused the leap, and hesitated to write the dictated words. "I shall bring with me," said the discomfited general in this address—"I shall bring with me a quantity of prisoners, and of flags. I have razed the palace of Djezzar, the ramparts of Acre; there no longer remains one stone upon another; all the inhabitants have evacuated the town by sea. Djezzar is severely wounded." Now every man in Egypt would know in a week that Acre was safe and sound; and every Oriental, comparing the words with the fact, would infer that the father of the lie was Fear.

In the following month the Osmanlis, encouraged by the failure of the French before Acre, landed at Aboukir under cover of the English guns, to the number of 15,000 or 16,000 men. They threw up intrenchments, and prepared to make war in their old-fashioned way. Bonaparte came down and destroyed the whole force.

Here was really a great and decisive victory: but the moment for the great adventurer's departure was now at hand. Mr. Warburton, after a few weeks of sailing and tracking on the Nile, owns to the irresistible longing which he felt for the blessed face of a newspaper. Yet compare the meagre news of the present era with the events of the period we speak of. In these days the deprivation of our newspaper would keep us painfully doubting whether the Rev. Mr. Ward was, or was not to be dressed as a freshman—would even condemn us to ignorance respecting the exact state of the great surplice controversy at Little Lower Churchington—but if a man were without recent tidings in 1799, he knew not to whom belonged the ancient kingdoms of Europe. For ten months the French had lived without certain news from their country; but Sir Sydney Smith (the most courteous of foes) now presented to Bonaparte a file of the "Frankfort Journal." Italy lost! "Les misérables!" cries Bonaparte (alluding to the Directory;) and instantly sees how welcome now to humbled France must be the return of her most fortunate general. He secretly prepares the requisite means—issues false announcements of his purpose in descending the Nile—makes a false appointment with Kleber—leaves behind him a false promise to return—and slips away forever from the shores of Egypt.

Kleber, disgusted at the cool escape of Bonaparte, and angry to find himself saddled with the duty of making the best of a very bad matter, commenced his administration by signing the Convention of El Arish, and provided for the deportation of the French troops to the shores of France, in French or Turkish vessels. The circumstances of this transaction so closely touch the subject with which we are dealing—namely, the good faith of nations—and are, in our view, so clearly stated by Mr. Alison, that we will give them in his words:—

"This convention was not signed by the British Admiral, Sir Sydney Smith; nor was he vested either with express authority to conclude such a treaty, nor with such a command as necessarily implied such a power. It was, however, entered into with his concurrence and approbation; and, like a man of honor, he felt himself as much bound to see it carried into effect, as if his signature had been affixed to the instrument. But the British government had, three months before, sent out orders to Lord Keith, commanding the English fleet in the Mediterranean, not to consent

to any treaty in which it was not stipulated that the French army were to be prisoners of war; and Lord Keith, on the 8th January, a fortnight before the convention of El Arish was signed, had sent a letter from Minorca to Kleber, warning him that any vessels having on board French troops, returning home in virtue of a capitulation other than an unconditional surrender, would be made prisoners of war. The continental historians of every description are loud in their abuse of the English government for what they call their bad faith in refusing to ratify the convention of El Arish. The smallest attention to dates must be sufficient to prove that these censures are totally destitute of foundation. The convention was signed at El Arish on January 24th, 1800, and Lord Keith's letter, announcing that the British government would agree to no capitulation, was dated Minorca, January 8th, 1800, or *sixteen days before the signature of the treaty*. This letter was founded on instructions sent out by the English cabinet to Lord Keith, dated December 17th, in consequence of the intercepted letters of Kleber, which had fallen into their hands immediately after Napoleon's return. Kleber no sooner received Lord Keith's letter than he resumed hostilities, and fought the battle of Heliopolis with his wonted precipitance, without once reflecting on the fact that the letter on which he founded so much was written not only long before intelligence of the treaty reached England, but from Minorca, *sixteen days before the treaty itself was signed*. 'No sooner, however,' said Mr. Pitt, in his place in Parliament, 'was it known in England that the French general had the faith of a British officer pledged to him, and was disposed to act upon it, than instructions were sent out to have the convention executed, though the officer in question had, in fact, no authority to sign it.' Orders accordingly were sent out to execute the treaty, and they arrived in Egypt in May, 1800, long after the battle of Heliopolis; and Kleber had consented to a renewal of the treaty, when it was interrupted by his assassination at Grand Cairo on June 14th, 1800. Sir Sydney Smith had no authority to agree to the convention, nor was he the commanding officer on the station, in whom that power necessarily resided, but a mere commodore in command of a ship of the line and two frigates, Lord Keith being the head of the squadron in the Mediterranean. This conduct—in agreeing, contrary to their obvious interests, to restore the French a powerful veteran army, irrecoverably separated from the Republic at the very time when it most stood in need of its assistance, in consequence of a convention acceded to without authority by a subordinate officer—is the strongest instance of the good faith of the English cabinet; and affords a striking contrast to the conduct of Napoleon soon after, in refusing to ratify the armistice of Treviso, concluded with full powers by his general, Brune; a proceeding which the French historians mention, not only without disapprobation, but manifest satisfaction.'—*Alison's History of Europe*, 5th edit., vol. iv., p. 561.

Lord Keith's instructions not to act upon the convention signed by the French and Turkish commanders were instantly communicated to Kleber by his high-minded foe, Sir Sydney Smith.

"The spirit," says Mr. Warburton, "which dictated the British sailor's act was understood in the deserts—a voice went forth among the tents of the Bedouins and the palaces of the despot, that

England preferred honor to advantage. Battles, since then, have been fought, and been forgotten—nations have come and gone, and left no trace behind them—but the memory of that noble truthfulness remained, and expanded into a national characteristic; and our countrymen may, at this hour, in the streets of Cairo, hear the Arabs swear 'by the honor of an Englishman.'"—vol. i., p. 55.

We do not distinctly understand whether Mr. Warburton means that the Arabs still remember and speak of this transaction, or whether he merely uses a form of speech indicating that an impression was produced upon their minds strongly favorable to the English character for honor. The latter view would probably be the correct one; for we confess we have not been so sanguine as to suppose that facts manifesting the honor and good faith of nations, are specifically understood and treasured up by the masses of the people in any country. Our steady hope of the reward properly belonging to national honesty is not founded upon a belief that any signal act of good faith will be long or accurately remembered by the multitude, but rather upon this firm belief, namely, that a long series of treaties performed and promises fulfilled, in spite of temptation to break them, will always be vaguely summed up in the minds of the nations, until in the end a corresponding amount of confidence is engendered.

It has been seen that Lord Keith's instructions forbade all capitulation, except upon the terms of the French surrendering as prisoners of war. "To such insults," said the heroic and fiery Kleber, "we will answer with battles and victories." And he made good his speech. An army of 40,000 Ottomans had passed the desert, and hung on the eastern frontier of Egypt. The French commander was obliged, therefore, to concentrate his troops; and as he did so, the utility of Bonaparte's attempts to influence the Egyptians was made manifest. Cairo rose, and forced its small garrison of Frenchmen to take refuge in the citadel. Other places followed the example; but meanwhile, on a fair moonlight night, the armies met near the ruins of Heliopolis, and Kleber gained by far the most brilliant victory that had been hitherto achieved by the French arms against the rude masses of the East. The victorious general followed up his military successes by an able civil administration; and a hard, yet steady and judicious pressure upon the resources of the country, soon enabled him to retrieve the financial condition of his army. Now, however, arrived instructions from England, based upon that high sense of honor which induced Pitt to ratify the merely implied approval of an English officer, even although that officer was wholly unauthorized to act. Kleber again signed the convention; but before he could give effect to its stipulations he was assassinated by a fanatical Mussulman.

Menou, the new French commander, repudiated the convention, and prepared to measure his strength with a foe more troublesome than any whom the republicans had hitherto encountered in the land of Egypt. The battle of Aboukir is vividly described by Mr. Warburton; but neither upon this nor upon the subsequent successes of the English arms can we now afford time to dwell. It is more within our purpose to remark that the prestige of French superiority, even over mere Orientals, was at length shaken; for a Turkish

general was persuaded to act in the field with such an astonishing amount of common sense, that he absolutely gained a kind of victory over Belliard, and compelled a French general, with 6000 prime troops, to retreat before scimitars, shouts, and yataghans.

At length a final capitulation was signed. The French (more tenderly used in treaty than in battle) were allowed to depart in peace; troops, artists, savans, and all, taking with them their arms and accoutrements, their collections of antiquities, and their famous drawings of Egyptian monuments.* The guns which they were forced to abandon amounted in number to several hundreds; but in order that, on arriving at Toulon, they might have the air of bringing back their artillery with them, they stipulated for the right of carrying off ten field-pieces. Thus, in almost all the acts of the invaders, from the day when the expedition sailed from France under the name of "The Left Wing of the Army of England," up to the final capitulation of Alexandria, we detect the principle of deception.

The convention of Alexandria must have counteracted, in great measure, the effect produced by our victories upon the public opinion of the East. Orientals habitually distrust the existence of a power which is exerted with anything like charitable, or even politic forbearance; and seeing that the Englishman had been induced to let his old foe escape so easily, they would hardly believe it possible that the latter could have been utterly beaten. If we had erected a handsome pyramid with the skulls of the French soldiers, and had sold all the savans as slaves, we should have conciliated more effectually the love and esteem of the Turks. Still, although our prowess had thus fallen short of perfection, we had done a good deal. The forced evacuation of Egypt by a French army, so lately holding it in military possession, was a fact for men's minds to dwell on. In time of profound peace and professed amity between the governments of the invading and invaded countries, a vast armament had landed on the shores of Egypt—the clear superiority of European discipline and European tactics had been displayed to the full—the invaders had shrunk from no sort or amount of expedient cruelty—they had spared no act of treachery—no form of falsehood, if only it seemed advantageous—they had debased themselves by renouncing their religion (or, if not their own, at least the religion of their forefathers) for the nonsensical forms of mere Orientals—their savans, too, had tried their little arts. And now—with their numbers diminished by nearly one half, their artillery reduced to ten pieces, their character for invincibility and good faith reduced to nothing at all—they passed away to the West like a plague, and, as though in compliance with the prayer of the Mussulmans, to "infest the cities of Christians."

The Ottoman empire now rested from French visitation; but before six years were over, the late general of the republican army in Egypt had become the emperor of the West; and when Se-

bastiani presented his credentials as ambassador at the Porte, he represented, to all seeming, the greatest of earthly potentates. His power, therefore, was great, and he knew how to make it tell. The diplomatist who represents a powerful European state at an Eastern court, must be something more than a mere rounder of periods and softener of phrases. Geographical distance is only one of the many causes which make it impossible to set down in London or Paris minute instructions that can be treated as strictly binding at the Sublime Gate of the Seraglio, or the Heavenly Ark of Tehraun; and where the Foreign Office is impotent to instruct, the ambassador must have power to choose. State events in the East, too, are sudden in their coming—grand in their consequences. By the test of a great emergency Sebastiani was tried, and he showed himself sagacious, decisive, intrepid—intrepid as though he were handling troops against some old-fashioned general, who issued his orders, like Cuesta, from out of a coach-and-six. The influence of Napoleon (we speak merely of his influence upon the court and councils of the Turks) was raised to a height that absolutely excluded the enemies of France from the friendship of the sultan. The English ultimatum was therefore imperious, requiring the Porte to come to an immediate rupture with France, and to join the Anglo-Russian alliance. The Divan replied by a declaration of war; and Admiral Duckworth, with seven ships of the line and two frigates, boldly forced the Dardanelles, sailed through the Marmora, and brought up within sight of the Seraglio point. The city was at this moment defenceless, and the ships of the sultan lay, tempting and easy of capture, in the Golden Horn. The Divan, feeling itself, as it were, in a glass-house, was vastly anxious to avoid being smashed, and fully disposed to give way. But Sebastiani, bold and sanguine, saw grounds of hope in the possible simplicity of the British commander. The full extent of a brave sailor's innocences in diplomacy could never be known until it was fairly tested; and "good Sir John" might perhaps be amused by pretended negotiations until the preparations necessary for resisting an attack could be perfected. At all events the Turks might be persuaded to try the experiment. They tried it. In seven days the defences of the city and the duping of the Devonshire admiral were complete. An attack was no longer practicable. The fleet, returning through the Dardanelles, once more ran the gauntlet of the monster-guns; and before the British commander anchored again off Tenedos, his losses were 250 men killed or wounded; an opportunity of bursting the Franco-Ottoman alliance thrown away; and his character for common sense missing. This brilliant achievement of course raised Sebastiani to the very zenith of diplomatic glory, and proportionately attenuated the resources of British negotiators throughout all Europe. Sir Robert Adair's highly interesting memoir of his embassy shows how keenly the check was felt by him at Vienna.

Pretty closely upon this capital blunder there followed our ill-advised descent (March, 1807) upon the coast of Egypt. The British force successfully established itself in Damietta and Alexandria; but a disaster sustained at Rosetta by a strong detachment of our troops, so discouraged those in command that they were glad to sign an honorable convention providing for the restoration of prisoners and the evacuation of the country.

* All these curiosities and objects of art were to have been delivered up to the English by the terms of the convention. The savans, however, stoutly rebelled against this provision. They declared that, if it were insisted upon, they would destroy all the articles in question, and would throw upon Lord Hutchinson the infamy of becoming a "second Amrou;" and the English commander was so much alarmed or mystified by this threat that he actually surrendered the claim.

Now, considering that at the time of planning the enterprise we were engaged in deadly struggle with an European potentate then fully a match for our strength, we are bound to conclude that, in the conception of this scheme for the invasion of Egypt, there was something of the frivolity which had characterized the French expedition of 1798. We had this, however, to say for ourselves, as honorably contradicting us from the French—namely, that we were at war with the sovereign of the country which we chose to invade.

At this time the alliance between France and the Porte appeared to be firm as the hills. An ambassador was accredited by the Sultan to Napoleon, and he found him where best an "emperor" befits the purple—he found him in arms on the Vistula, in all the pride and strength that is implied by a line of operations as safe as the Champs Elysées, yet more than a thousand miles long. Napoleon, recurring to his favorite Oriental style, told the Ottoman, that sooner should his right arm quarrel with his left than he the Emperor of France with his brother the great Padishah. There is every reason to believe that at this moment Napoleon was sincere; but he thought no more of breaking inconvenient engagements with a Turkish ambassador than if he had spoken his promises to a mere turban and bundle of shawls, without a man in the midst of them. This was soon proved; and we shall presently see that, in a very few months from the utterance of the vow just quoted, the "right arm" quietly agreed to the dismemberment and partition of the unfortunate "left."

In the character of a gifted, high-spirited parvenu, (and our remark applies to the small social ambitions, no less than to the broad arena of public affairs,) a readiness to insult or deal sternly with the older, and more feeble-minded rulers of the earth is often found strangely united with a susceptibility of being cajoled by them. The power and the weakness—the poison and its antidote—grow up together. Of this seeming anomaly in the human character Napoleon stands an example. Until after the battle of Friedland he had been the conqueror—the humbler of princes: now he mounted the raft on the Niemen; and lo!—great joy for the wily Alexander—great joy by-and-by for Europe—he showed his weakness, that weakness which afterwards reduced him from a self-trusting soldier to the mere son-in-law* of a German sovereign. The Great Captain, in short, was cajolable, and he who had been trampling so fiercely on the House of Brandenburg could at once be flattered and talked into meanness by the imperial craft of a Romanoff. Alexander affected to be irresistibly charmed, and even subdued, by Napoleon's style of talking—a style (so Count Munster described it) "half lapidary, half quack-advertisement." By thus seeming to be wheedled himself, the Czar absolutely wheedled Napoleon into engagements for the partition of the Ottoman empire. Contrive that your enemy shall betray his friends, and you gain a long march on him.

* The fatuity with which Napoleon, in 1813 and '14, relied upon the aid of his "beaupère" is made to appear very plainly in Caulaincourt's memoirs. But the most melancholy trait is that told by Bourrienne of the emperor's coolly alluding to some room in the Tuileries as having been decorated in the time "du Roi, mon oncle"—Louis XVI.—husband of poor Maria-Louisa's aunt!

And this march Alexander gained over Napoleon by persuading him to betray the sultan. No obscurity now veils the secret arrangements of Tilsit. Bignon, the appointed defender and diplomatic historian of Napoleon, seems to have thought it necessary to begin by wrapping up his hero's treason in a slightly nebulous phrase, and therefore, instead of saying at once that the dismemberment of the Grand Signor's dominions was decided upon, he tells us that the French emperor was induced to extend towards the czar "a certain tolerance in the direction of Turkey." He is afterwards, however, compelled to give the eighth written article, which formally provided for the partition of the Ottoman empire, in the event of the sultan's refusing or delaying to accept Napoleon's mediation: and, finally, he admits that the emperors did in fact come to an unconditional agreement for dividing between them the whole of European Turkey, except the city of Constantinople and the promontory on which it is situate. In short, the fair provinces of the sultan, to whose government Napoleon had been swearing eternal friendship, were treated as diamond snuff-boxes, and quietly presented by emperor to czar, and czar to emperor, with assurances of "high consideration."

Instantly (that is, even before he departed from Tilsit) Napoleon despatched eager instructions to Marmont, in Illyria, and to Sebastiani, at Constantinople, preparatory to the seizure and enjoyment of the Western Pashalics. But an arrangement for the partition of the Turkish empire, without providing for the appropriation of Constantinople, was illusory. The sultan, retaining only the city itself and the promontory on which it stands, could not have preserved the envied site against the imperial holder of Bulgaria. The amity of the emperors had some duration, and seemed to be prolonged for a while by the conference of Erfurth; but Napoleon, finding at last that he had been duped, (for "tolerance in the direction of Spain" was no fair exchange for "tolerance in the direction of Turkey.") gradually receded from his engagements. This was usual with him. When he made a blunder in war, he denied it; when he blundered in the making of a treaty, he broke it. No partition took place, and the sultan still held his own.

It might seem that because the magnificent gifts offered to the Czar by the French emperor consisted of another man's provinces, and because, too, those gifts were never actually handed over, therefore the concessions of Napoleon cost him but little. They cost him dear indeed. If the engagements of Tilsit had never been entered into, of course the irritation occasioned by Napoleon's breach of them would never have been engendered. And this very irritation was the true virus of that protracted altercation that brought about in due season the fatal invasion of Russia. But Napoleon's ill faith in making the arrangements of Tilsit, no less than his ill faith in evading them, was to the French emperor an element of destruction. The betrayal of the sultan brought its separate punishment upon the faithless ally. And thus it was that retribution came. When Napoleon was preparing for the invasion of Russia, that power, then at war with the Porte, was engaged with a vast portion of her military force on the Lower Danube. Her successes had been slow and insignificant, her failures mortifying, the loss of men occasioned by the insalubrity of the

climate very great; and now that she was to be attacked in the heart of her empire by the great Napoleon in person, at the head of the whole western continent, her hitherto ineffectual efforts on the Danube would necessarily be paralyzed, and the Ottoman, with a very little more of vigor in the conduct of the war, might seriously humble his ancient enemy, recover lost ground, and retrieve the disgraces of half a century. Moreover, the vast seeming greatness of the French emperor at this period must have tended strongly to fascinate the Oriental mind. How then, and by what earthly means, could the Divan be persuaded to resist these attractive forces!—By reminding it of Tilsit. There was nothing to set against the greatness of Napoleon's power, except the greatness of his treachery. The true tenor of the secret arrangements was carefully manifested and explained to the simple Turks; and these men, understanding how coolly their supposed ally had prepared to dismember their empire, were fired with an indignation so strong as actually to supersede the desire of gratifying national selfishness and old national hates. The Porte not only refrained from taking advantage of Russia's predicament by pushing the war with alacrity, but was actually induced to conclude a peace with the czar. Thus Russia was enabled to concentrate all her resources against the French invader. Troops from the Ottoman borders were rapidly drafted northward; and when Napoleon, retreating from Moscow, approached the banks of the Beresina, Tchitchagoff, with a force of some forty thousand men, now freely spared from the Danube, completed that terrible circle which turned the failure and embarrassment of the "grand army" to absolute destruction.

The last great era of ambitious interference by France in the affairs of the Levant is that of 1840. The diplomatic strife of that and the preceding year was waged in two acts: first, the French abandoned the sultan for the sake of madly abetting Mehemet Ali against the four powers; and, secondly, they abandoned Mehemet Ali in order to return to their senses. The history of act the first long since received full noon-day light from Lord Palmerston's admirable despatch of the 31st of August, 1840; but the second phase of the business, and the coolness with which the promises of France to the Pasha of Egypt were made and broken, can never be so plainly made manifest as by quoting the very words of the two Frenchmen who, in 1840, successively held the portfolio for foreign affairs. The four powers had been holding stern language to Mehemet Ali, and had plainly warned him that, if he delayed the surrender of Northern Syria beyond the period fixed upon, they would wrest from him not only that territory, but Acre and Palestine too; and that, if he delayed yet further, they would put a period to his rule even in Egypt. The crafty old Pasha, thus menaced, naturally turned to his volatile protector, and wanted to know how far he might rely upon French aid. M. Thiers instantly despatched M. Walewski (a reputed son of Napoleon, and therefore hereditarily entitled to watch the state of the "French Lake") with instructions to promise great things in the name of France—armed and arming. On the 25th of November, 1840, M. Thiers stood in his place in the chamber of deputies, and spoke these words:—"I proposed to the king, therefore, to arm not 400,000 but 630,000 men of the line, and 300,000 of mo-

bilized national guards. * * * This was what I said to the Pasha—'Do not pass the Taurus; cover well St. Jean d'Acre and Alexandria; demand the mediation of France, and if you can make the war last out—if you can prolong it till the spring—France will then, at the head of all her forces, negotiate for you, and will do so with advantage.' * * * We thought it necessary to add a physical effect to a moral effect—that is to say, to send the French fleet to Alexandria, [this was never done,] and to make the French flag float on the walls of that town [nor this.]" "Yes, gentlemen," said the same statesman, on the 28th, "I would have demanded the modification of the treaty, [the treaty of the 15th of July,] and if it had been refused, although, as a statesman, I know perfectly well how terrible the word *war* is for a country, I would have cried war! war!—and I should have found an echo in France."

These were not the words of a mere sub-editor of a war-crying journal, but of a man who had just delivered up the portfolio of foreign affairs, and who, not two months before, had power to engage for a mighty nation. But whilst M. Thiers was promising, the four powers were performing: they let slip the dashing Commodore Napier upon the coast of Syria. Thiers continued to promise, but he withdrew his fleet—lest (according to the authority of the Prince de Joinville) it should gain a "deplorable victory" over the English, and left the four powers to have their own way on the "Lake": these, accordingly, proceeded to execute their treaty with what the French called a "brutal" exactness. Sidon fell—Caiffa too, and Tyre—Beyrout fell. Acre—famous once more—received for two hours the fire of the allied fleet; but, at four o'clock, sudden darkness burst up through the sunshine—then hung aloft in the air, and canopied all the town. The armed vessels heaved and shook, for the bed of the sea was tremulously lifted beneath them. The principal magazine and the whole arsenal had blown up. "By the explosion," says Sir Charles Smith in his despatch, "two entire regiments, formed in position on the ramparts, were annihilated, and every living creature within the area of 60,000 square yards ceased to exist." Our seamen, they say, for a while stood silent, respectful in their demeanor—as though this end of man's defences had been wrought from on high, or by the chaotic energies of nature. The firing immediately languished—then ceased altogether;—and "cruel, cold, formal man" was shocked into such forgetfulness of his old punctilios, that parleying, and flags of truce, and the downhauling of colors were neglected. No formal surrender took place; but the gates of the town stood open, and the allies were free when they chose to go in among the corpses and ruins.

Thus, whilst Mehemet Ali was listening to M. Walewski's account of the numerous wonders which France could, or should, or would, or might have wrought in his favor, he found himself driven from out of all Syria by a series of those impressive phenomena which our neighbors so quaintly describe by the name of "accomplished facts." Meanwhile, France had found a sane minister, and she now coolly repudiated her engagements with the pasha—as mere lover's vows made in the summer time, and properly broken in autumn. "France," said M. Guizot, "that did not go to war in order to hinder Poland from falling into the hands of Russia, cannot now

do so in order that Syria may remain in the hands of the pasha." And again, in the chamber of peers, on the 18th of November—"We have done all for the pasha, all that our influence could effect, and now we are asked to go to war with him, as if he were a near neighbor whose fate was connected with our own. Gentlemen, this is asking too much—this is impossible. We have, I repeat, done for him all that our influence could do; we were not bound to do more for him, and we cannot undertake to do more for an ally so distant and so uncertain. * * * Gentlemen, do not talk now to France of conquests, of glory, of combat. Let her live in peace, rich, prosperous, and in the bosom of liberty." And these prudent counsels were followed; but is it to be wondered at that, by a course of conduct such as that which we have described, the influence of France in the Levant should be grievously weakened? There are two distinct shafts, one after the other, down which human frailty may fall. A man may fall from innocence to crime, and may then find a lower depth by betraying his guilty comrade. France effected both these descents. She abandoned her ally the sultan to make common cause with his rebellious vassal, and then in his direst need she abandoned her hoary accomplice. Every statesman knew that France, in breaking with the sultan, had not only swerved from her formal engagements, but from the old course of policy which, in times of national sanity, she had always adopted. It was thoroughly necessary for her to retrace her steps; but unhappily the levity with which her minister had been pledging her in the opposite direction made it impossible for her to do so, and yet retain her fair name. For men number these things—vaguely, indeed, yet with enough of tenacity to preclude a new growth of confidence. It is vain to talk and say to a shrewd old soldier like Mehemet Ali that "the ministry of the 1st of March" was displaced by "the ministry of the 29th of October." Mehemet Ali treated not with this or that administration—he treated with France: he was to have the support of a nation that promised to negotiate for him at the head of 930,000 soldiers: he resists accordingly; and then he is told that second thoughts are best, and that his ally can do no more for him because she is determined to "live in peace, rich, prosperous, and in the bosom of liberty!" This abandonment of an ally—even although the engagements made with him had been lawlessly and rashly contracted—could not of course take place without bringing discredit on France. The moral damage which she sustained by throwing over the pasha, is thus set forth by the very man who had been pledging her:—"Do you know," said M. Thiers, on the 25th of November, 1840, in the chamber of deputies, "what will result from such a settlement? France has lost all of her influence in the Mediterranean—and this is not only a physical loss, but it is also a moral one; whereas, if you had been willing, you might have got rid of the treaties of 1815. *Our influence in Europe is lost forever.*"

After glancing at a passage of history like this, it is most gratifying to see and feel assured that, under the practice of our constitution, the honor of England in her dealings with foreign nations is not liable to be thus compromised by changes of administration, or stress of party politics. The admirable working of our political system in this respect may be well illustrated by the events of the very period to which we have been adverting.

Rarely since the revolution has there existed in this country a government so wanting in parliamentary support as that of 1840—never was a government so powerless at home;—yet at that very period England was enabled to take a bold, decisive, and brilliantly successful lead in the affairs of Europe. This she did to the utter confusion of Thiers, who had all along fondly reckoned that the general weakness of the British government must include a paralysis of the Foreign Office. The secret of England's strength, and of her then immense influence, lay in the perfect unanimity of all such of her statesmen as were really conversant with the affairs of Europe, and the high-minded patriotism which enabled them to keep their judgments upon the great concerns of the nation unwarped by party contests. The Duke of Wellington, on the 26th of January, 1841, reviewing in parliament the events of the preceding year, "expressed his approval of the course of foreign policy which had been adopted. He had long viewed with anxiety the dangers that were likely to result from the state of affairs in the Levant, and he rejoiced to think that those dangers would now be averted. * * * As to the late negotiations, he had attended carefully to the whole course of proceeding, but he could discover nothing which France could construe into a cause of offence—he saw nothing on which a difference with France could be grounded; nor could he discover any fault which had been committed on our part." Not at all forgetting how much may be owing to the well-directed abilities of the late secretary for foreign affairs, we repeat that this unanimity of our chief statesmen was the main secret of the high and brilliant position occupied by England in 1840. But whence this unanimity among men opposed to each other in party strife? Was it fortuitous? No; it resulted from this—that the policy adopted by the minister of the day was not founded on the personal whim or newly-conceived opinion of any mere individual, but was, in fact, the old, time-sanctioned policy of England. New events may, from time to time, necessitate variations in our system of foreign policy; whenever this happens there will probably arise divergencies of opinion amongst our statesmen, and the usually consequent symptoms of national indecision; but we are happy to believe that whenever the traditions of the Foreign Office and the course of policy thence deducible can be closely followed, the minister of the day, working out that policy with zeal and ability, may reckon upon the support of all those British statesmen, no matter what their party, who are really initiated in the state-affairs of Europe. Foreign nations, too, know this; that engagements entered into by a British secretary of state for foreign affairs, however strongly disapproved by his successor, will yet be honorably performed. The Duke of Wellington was no strong approver of the Quadrupartite Treaty; yet when he accepted the seals of the Foreign Office, in 1834, he proceeded to execute its stipulations with ready promptitude and zeal.

Addressing ourselves, as we do in this article, merely to the relations of the "Grand Nation" with Eastern potentates, we cannot advert to the system followed by France on the more western coasts of the Mediterranean, except for the mere purpose of remarking that her exertions to gain influence in these quarters have been in some measure like to those which she has made in the Levant. How sounds the French name in Spain!

The Peninsular War—the Trocadero—the unexcused evasion of France from the Quadrupartite Treaty, and her subsequent alliance with mere factions of the state—these are the headings under which modern history chronicles the obligations conferred on Spain by her magnanimous neighbor.

If we look to the Italian shores of the "Lake," we are instantly reminded of the unfortunate Liguria, Roman, Cisalpine, and Parthenopean Republics—of Venice betrayed to Austria at the peace of Campo Formio—of pictures and statues seized by Napoleon, and restored by Wellington—of the enthusiastic insurgents of late years, men perpetually abetted, and never protected, by France. Again, turning to the African coast, we see how successfully the "Grand Nation" with her vaudevilles and her razzias has ingratiated herself with the Algerines—how faithfully she has observed her engagements to abstain from territorial acquisitions.

Meanwhile, and concurrently with all this uneasy ambition, France has been losing the almost exclusive trade which she formerly enjoyed on the coast of Syria. The amount of her commerce in the Mediterranean is now surprisingly small, when considered with reference to her geographical position, and the industry and skill of her people.

And now, by all the blood shed—by all the treasure expended—by all the alliances repudiated—by all the treaties broken—by all the commerce lost for the sake of this coveted influence in the Mediterranean—what amount of solid power has been really acquired by France? In order to answer this question, we cannot have recourse to a much better authority than "La Presse,"—a paper understood to receive part of its wisdom from M. Lamartine, who has bestowed great attention upon all questions affecting the relations of France with the Levant. And thus it is that this journal, so lately as the 14th of last February, described and deplored the position of France upon the shores of her favorite sea:—"There is one phrase of Napoleon's which has often been repeated, but which is nevertheless true, [how naïve!] and it is this—'the Mediterranean is a French lake.' Assuredly this expression was just; and we may be allowed to believe, that if Napoleon had been allowed to remain longer on the throne, and had not been absorbed by inevitable diversions, he would have established it as a truth. Unfortunately, he possessed neither the leisure nor the means; and since the fall of the empire this legitimate wish has not only not been realized, but our influence is daily diminishing in the Mediterranean."

We hope that our retrospect of those failures which have attended both French and English encroachments upon the territories of the sultan may induce a belief that the non-seizure of Egypt by the British government is an excusable piece of remissness. We are far from blinding ourselves to the absolute necessity of maintaining unquestioned and uninterrupted our right of passage to India by way of the Isthmus; but it is precisely because we recognize the importance of this privilege that we would repudiate all notions of territorial aggrandizement in the direction of Egypt. It is in Paris, and not here, that the idea of England's permanently enjoying a free transit by Suez has been perpetually associated with that of her seizing Egypt.

There is really no ground at all for supposing that unjust aggression upon the territories of the

sultan is a condition necessary to our maintaining the right of way. Happily for England, this privilege of free passage across every part of the sultan's dominions has been granted and confirmed to her by a long series of treaties. The first of these was made so early as in the reign of our Queen Elizabeth; and its provisions have been formally ratified and liberally enlarged by numerous later treaties and conventions coming down to our own time. The articles entered into between the sultan and Queen Elizabeth are recited verbatim in the subsequent treaty of 1675.* By the first of these the shores and ports of all the territories under the dominion of the sultan are opened to vessels bearing the English flag. The second article provides "that the said nation" (England) "shall likewise safely and freely go and come by land within the limits of our imperial dominions" (the sultan's territories) "without any injury, molestation, or impediment to the persons, cattle, estates, or effects of the said nation." Both the treaty just quoted (that of Elizabeth) and the treaty of 1675 contain many anxious and carefully-framed provisions for giving force and substantial value to the conceded privileges; and by the last-mentioned act it is formally stipulated that all future imperial mandates under the seal of the sultan shall be absolutely void in such of their provisions as may clash with the words or spirit of the treaties. And these solemn engagements are not vain words, but have been acted upon with remarkable fidelity by the Ottoman government and those in authority under it. We most of us remember the wise forbearance of Mehemit Ali, who, at the very time of our wresting Syria from his military occupation, was safely transmitting our Indian mails across the Isthmus of Suez. This instance, no less than the probabilities fairly deducible from an abstract view of the matter, justify us in inferring that any satrap of the Porte holding the government of Egypt—and whether independent or not—would find it vitally for his interest to keep us unmolested in our passage. His interference with that privilege, or even his failure to secure us from the interruption of others, would speedily work his ruin.

By constant and uninterrupted usage, therefore, no less than by strictly legal ownership, a privilege of free passage through all the sultan's territories belongs to England. Our claim to go unmolested across the Isthmus of Suez is as clear by public law as our right to cross the West Riding; and whoever interfered with the enjoyment of it would take upon himself those responsibilities which attach to an invader of the British dominions.

On the other hand, an invasion and seizure of Egypt, whether by England or by any other of the Great Powers, involves an European war, and this we are invited to brave for the sake of a privilege which we already enjoy unmolested! But, then, it is said that a state of confusion may arise upon the death of Mehemet Ali, and that therefore we must shape our policy with a view to the probable dismemberment of the Ottoman em-

* The style and titles of our merry King Charles II. are thus oddly set forth in the treaty:—"To the Glorious among the Princes of Jesus, revered by the High Potentates of the People of the Messiah, sole Director of the important Affairs of the Nazarene Nation, Lord of the Limits of Decency, and the Honor of Grandeur and Renown, Charles II., King of Great Britain, France, and Ireland."

pire—that in short we must take time by the forelock, and begin to burn down our house at once in order to exclude the possibility of its being burnt down accidentally! This would be carrying precaution too far. The course which it behoves this country to take lies as clear to the sight of the practical statesman as to that of the political moralist: always in the long run is good faith expedient; but brought to bear upon our Eastern policy, it is no less plainly advantageous in its immediate and early results than in its ultimate consequences. We stand deeply pledged to maintain unpartitioned the territories of that very state under which we possess by treaty, and enjoy, in fact, the now precious right of free passage. Our duty, therefore, and our interest are one, and are simply this:—to avoid encroachment ourselves, and to prevent encroachment by others. We can be honest, and yet prosper. We can hold our own—not by snatching a province from our ancient ally, but by keeping his dominions entire.

Perhaps it is well for our country that the weight of France, necessarily so great by reason of her martial prowess and her immense military resources, has not been aggravated by the accession of that vast moral power which she would have inevitably gathered about her, if during the last half century she had respected neutral states—had pursued her foes with steady enmity, and had lent to her friends and allies a constant and faithful support. At all events, we can draw from the experience of our great neighbor a new confirmation of the ancient truth that honesty is the best policy; and when, whether it be in the Levant, or on the banks of the Indus, we are tempted to break faith with men because they are weak in the hour of battle—because they wear turbans, or turn their faces to Mecca—we may strengthen our old love of truth by a glance at the "French Lake," for there and on its shores there broods a history most apt for teaching how halt, lame, and blind is the march of a nation that rests her ambitious hopes on violence and ill-faith.

From the Edinburgh Philosophical Journal.

On the Physical Facts contained in the Bible compared with the Discoveries of the Modern Sciences.
By MARCEL DE SERRES.

THE greater part of those who have meditated on the Sacred Writings, have turned their attention rather to the religious ideas contained in them, than to the accuracy and importance of the physical facts exhibited in their pages. Finding in these books, superior to all others that have been written, truths essential to the destiny and vocation of man, they did not think that they ought to seek in them light or information respecting the material world, which has been given to us as a subject for our researches and investigations. They have thought the less of this, because in the eyes of some of them such a consideration appeared alike futile and superfluous.

To make amends for this oversight, we shall concentrate our examination on the physical facts contained in the Bible, and which the sciences have made known to us only a short time antecedent to the present. This we are the more called upon to do, because we have here studied the Sacred Writings only in one point of view, namely, with regard to the positive notions they give us respecting the whole of creation. We

cannot too often repeat, that, in the examination on which we are about to enter, we have looked upon Scripture with the eye of a natural philosopher, not of a theologian; the material world has alone attracted our regard.

The most important point, relative to the creation, and of which we have still no knowledge but from the Bible, is the distinction which it establishes between the creation of the universe and its coördination. Thus, in the beginning (*in principio*) all the matter which compose the earth and heavens was created; afterwards, this matter was appropriated and formed the stellar and planetary bodies of the solar system, as well as those of other systems.

We have already shown elsewhere on what grounds this interpretation rests; it appears particularly obvious when we direct our attention not only to the first verse of Genesis, but to those that follow, particularly the 7th, 8th, 9th, and 10th verses of the first chapter. It is useless, therefore, to insist longer on this point. We shall merely observe, that physical facts demonstrate the accuracy of this interpretation. Undoubtedly the whole of matter had been created at the beginning of things, and probably no new matter is formed. But it was not coördinated nor organized at the origin of time in its universality; for every day celestial bodies are produced, under our own eyes, which are the result of the condensation of this same matter. It will continue unceasingly to become condensed, and will form stars more or less complete, as long as any of it remains capable of assuming new forms and new dispositions.

If such concretions are still preparing and organizing celestial bodies, it is evident such formations indicate to us that if matter proceeded from nothing at the first, it was not appropriated till a long while after its creation. This process is constantly carried on in the ordinary course of things: far from being completed, many ages will elapse before it has reached its limit. It is with reason, therefore, that the Sacred Writings have distinguished the creation of matter from its posterior arrangement.

The chaos in which Genesis represents all matter to have been at the birth of the world, (and particularly that which afterwards formed the earth,) is a proof that Scripture rightly distinguishes creation and coördination. This matter, at first without form and void, from which the globe we inhabit arose, would appear to have been analogous to those nebulosities, the condensation of which produces, under our own eyes, new celestial bodies. At every period nature has thence derived the elements with which she has formed the celestial bodies composing the wonderful assemblage of the universe. It is likewise from the bosom of these masses of nebulosities, so abundantly diffused through space, that she draws the stellar and planetary bodies.

It is a remarkable fact, that the cosmogony given in Genesis, is the only one that has established this distinction between the primitive creation of all matter and its coördination. Not long since, our knowledge was not sufficiently advanced to enable us to appreciate these great differences in time and in things. Not less than seven thousand years were necessary to enable us to comprehend the reality of such a distinction, and to show that it was founded on the nature of things. We can now follow step by step these transforma-

tions of nebulous matter, and see it pass through different states before producing stellar and planetary bodies analogous to those of the solar system.

This distinction,* established by Scripture, is founded on two orders of facts entirely independent of each other, and which, owing to that circumstance, have their weight and authority increased. The first refers to the transformations which take place, in space, between nebulosities and the new stars produced by their condensation. The second has reference to the space of time necessary for the light of the most distant nebulosities to reach us. This space is so considerable, that, according to the observation of facts, we must refer the first emission of this light to about a hundred thousand years before the appearance of man.

If, then, the luminous rays emitted by nebulosities require so long an interval in order to become visible, the stars which transmit them to us must have been created before the last arrangements were made on the surface of our planet. Now, as these rays require about a hundred thousand years to reach us, and as the final dispositions made on the earth do not go back further than seven thousand or seven thousand five hundred years from the present epoch, the stars to which we owe this blessing must have been created at the commencement of things, or, to use the expression in Genesis, at the beginning—in *principio*. An immense interval must therefore have intervened between the creation of the celestial bodies and their coördination. This interval is still greater when we turn our attention not to the stars of the solar system, but to those which form no part of it. In fact, the former are completely terminated; but it is not so with the others. This work has, however, commenced at an era separated from ours by immense periods, and the succession of ages has not sufficed to complete it.

This coördination of a matter preëxisting since the origin of things, cannot be considered as a true creation. The latter could not take place unless the materials of which the celestial bodies are composed had been derived from nothing by the power and volition of the Creator. No doubt the condensation of the nebulous matter causes that matter to assume new forms; but while acquiring these its nature is not changed; it only passes through different states. This appropriation, and these different dispositions, assumed by a substance already formed, cannot be likened to a real creation.

In this case there is, indeed, a change in the state and form of the original materials, but there is no new production. This production, however, would be necessary, in order that these changes and modifications could properly be regarded as acts emanating immediately from the creative power.

* Not only does Genesis distinguish the creation of matter from its coördination, but the same thing is observable in all the other books of Scripture. Thus we find in Psalm xxxiii., verses 6th, 7th, and 9th, that "By the word of the Lord, were the heavens made; and all the host of them by the breath of His mouth. He gathereth the waters of the sea together as an heap; he layeth up the deep in store-houses. He spake and it was done; He commanded and it stood fast." So much for the spontaneity of creation. With regard to the posterior coördination of the objects created at the beginning of time, we read in Psalm viii., verse 3d, "When I consider thy heavens, the work of thy fingers, the moon and the stars which thou hast ordained."

Matter being once created, secondary causes, under the direction of Divine Wisdom, would tend to make it assume determinate forms, and proceed in a regular course. Accordingly, the forces which nature holds in some degree in reserve, in order that they may be brought into action when any disturbing cause threatens to interrupt the order and harmony of created things, she also destines for acts still more important. Their power, essentially conservative, brings the newly produced celestial bodies into a firm and stable condition—a character distinctive of stars arrived at their perfection.

If the proofs of so many facts, the first knowledge of which we owe to Moses, are written in indelible characters on the strata which form the crust of the globe, those of the truth of the first verse of Genesis are traced in characters of fire on the celestial vault. It is there that we discover the confirmation of it, and perceive its perfect accuracy.

When we turn our attention to the immense assemblage of nebulosities and stars sparkling in the firmament, the laws of which the sacred writer has so distinctly perceived, we are less surprised that he has discerned with the same sagacity those which regulate and determine their movements. Moses gives us to understand that the stability of the course of the celestial bodies depends on their mutual gravitation, and the extent of the distance which separates them.

It is true that he has not developed the system of attraction in all its extent; but he has fixed its principles, without expressing it in a scientific language which could not have been understood. He leads us at all times to understand that the law of gravitation regulates the phenomena of the universe, that it is sufficient for all, and maintains in it both order and variety. Emanating from Supreme Wisdom, this law has presided, since the origin of time, over the harmony of created things, and renders all disorder among them impossible.

The discovery which enabled Newton to demonstrate that bodies attract each other in the direct ratio of their mass, and in the inverse ratio of the square of distance, is the noblest triumph of the human mind. At the same time this law is only the reduction of the celestial movements to a mechanical law, the cause of which remains unknown. Newton did not regard it otherwise, since he has employed the word only conditionally, as presenting a sensible image of the phenomena observed, *quasi esset attractio*.

If we represent this universal force as depending on some more general mechanical conception, for example, the existence of an elastic ether diffused throughout the whole universe, there would still remain the *why* of this existence; the second *why* would immediately lead us to another still more remote; and the last of all must remain forever inaccessible, not only to the efforts of our thoughts, but even of our imagination.

When Scripture speaks of the earth, it 'teaches us that God has laid the foundations of it, and that it shall never be shaken; for he has fixed it upon its poles.* It then represents to us the

* See Psalm civ., verses 5—9, "God laid the foundations of the earth that it should not be removed forever. The deep covered it as a garment; the waters stood upon the mountains. At his rebuke they fled; at the voice of his thunder they hasted away. They went up by the mountains; they went down by the valleys unto the

terrestrial globe as having passed, in its earliest ages, through the state of a kind of vapor more subtle than the most attenuated and finest dust. If it speaks of its form, it represents its true spheroidal figure, and compares it to an immense globe or vast sphere.* When it speaks of its position in space, it represents it as suspended on nothing, or on a bottomless space. It also correctly describes its dimensions and size.†

If it directs our attention to the heavens, it designates them by their extent, *rakiah*. Notwithstanding the accuracy of this interpretation, which represents the immensity of the celestial spaces, the Greeks, in the Septuagint version, as well as the Latins, in the Vulgate, have presumed to correct it, because they did not perceive the extent of its import, or because they could not understand it.

The heavens, in the Bible, are the immense, infinite space, through which the nebulous matter, the universal source of all the celestial bodies, is diffused. They constitute the *expansum* or immensity, and not the *firmamentum* of St. Jerome, nor the *σφαίρα* of the Alexandrine interpreters, nor, finally, the eighth heaven of Aristotle and all the ancients, which they represent as firm, solid, crystalline, and incorruptible.

Moses alone has distinguished the primitive light from that whose benefits we derive from the sun. He has represented it to us as an element independent of this luminary, and as anterior by three epochs to that when it received its brilliant atmospheres. This particular in the account of the creation, was long considered as irreconcilable with physical facts. The distinction has brought many reproaches on the author of Genesis: those who uttered them, struck with the splendor of the great luminary which presides over the day, could not conceive that other sources of light existed both for the earth and for the rest of the universe. But the difficulties which have been felt, as to the accuracy of the Mosaic narration, have not kept their ground before the discoveries of science. In fact, an immense quantity of light is produced here below, and developed in an infinite variety of circumstances, altogether foreign from that we derive from the sun. Of this nature is the light emitted by volcanic fires; also that accumulated on the surface of clouds, which is not an intermittent, but continuous light. This light, produced by their phosphorescence, was sufficiently bright, aided especially by temperature, humidity, and electricity, all of which were more considerable in the first ages, to make vegetables grow, before the solar rays had caused their powerful influence to be felt.

Neither does Moses represent the light as created, as biblical commentators have unreasonably supposed; but he represents it as bursting forth at the voice of God. The author of Genesis, therefore, is rather in harmony with the theory of vi-

brations or undulations, generally adopted, than with the theory of emission, which cannot explain the whole of the known facts.

place he had founded for them. He has set a bound that they may not pass over; that they turn not again to cover the earth."

* See Job, chapter xxvi., verse 10; Proverbs viii., verse 27; Isaiah xl., verse 22. [Some of M. Marcel de Serres' views regarding certain passages of the Bible, are more fully borne out by Martin Luther's German version than by our English translation.—Ed.]

† The Hebrew text bears that "God has stretched over the void the vault of heaven, (*le septentrion*.) and suspended the earth on nothing, (*al belimah*.)" The Greek reads "Κρεμάτων γῆν ἐπι οὐδενί," (Job xxvi. 7.)

In this point of view, the Hebrew lawgiver would have appeared superior to Newton, if that great genius had not himself been favorable to the hypothesis of vibrations, although, for his explanations and calculations, he adopted the theory of emission. It is in the letter written by him to Boyle that he has endeavored to demonstrate that the vibrations of the ether, determining the phenomena of light, may furnish an explanation founded on those of weight or attraction.

The letter in which this great and beautiful conception appears, has been published by M. Frédérick Maurice, in the *Bibliothèque Universelle de Genève*. This savant there shows how simple it is, and conformable to the laws of nature, to derive the principal and most important phenomena of the physical world, from the preëxistence of a single fluid eminently elastic and subtle. He shows us how, by means of this mystical tie, Newton designed to coördinate all the movements of the great bodies of the universe, and bring together the whole physical facts to that first unity which renders their coördination so admirable and wonderful.*

This same natural philosopher leads us to remark, that, in this reference made by Moses to light, as existing and shining with all its splendor, before there were any luminous bodies destined to shed it in a constant manner on the earth, it is difficult not to perceive a striking proof of the inspiration of the Book which announces such a fact.

While admitting a light independent of the great luminaries placed by the hand of God in the midst of the celestial spaces, Scripture does not fail to direct our attention to the magnificence and splendor of the solar rays. We are informed that man cannot endure their brightness, when the winds have cleared the sky, and when the north wind causes the golden sun to shine.

When Moses turns his attention to the numerous stars which impart to night its magnificence and beauty, his knowledge appears superior to that of the ancient astronomers, who, in their imperfect observations, have classified only about a thousand.† He, on the contrary, multiplies them to infinitude, and regards them as innumerable. Thus, in a single word, he represents to us the immense quantity of stars which compose the milky way, or which are disseminated through the celestial spaces. Continuing the examination, he compares them, as Herschel might have done, to the grains of sand on the sea-shore. We might not, perhaps, have seen anything else in these expressions but a simple figure, had not Scripture added, "God has scattered them with his hand in space like dust," and however great their numbers, "He names them all by their names."

* Newton's letter to the Royal Society of London, written in 1675, has been inserted in the history of that society, published in 1756, by Birch. With regard to that of Newton to Boyle, it has been translated by Pictet, and may be found in the *Bibliothèque Universelle de Genève* for 1822. In this letter Newton admits the propagation of light by means of the vibrations of an ether preëxisting and everywhere diffused.—See the 21st verse of the xxxvii. chapter of the Book of Job.

† According to Hipparchus, there are not more than 1022 stars in the heavens; although the number was a little increased by Ptolemy, they did not amount, in the eyes of the latter astronomer, to more than 1026.

When not speaking of their numbers, but of the order and regularity of their movements, Scripture compares them to an army advancing to battle. It represents this celestial army as incomparable for the multitude of its soldiers, and the perfection of its evolutions. Filled with wonder at the magnificence of the heavens, the sacred writer exclaims, in rapture, "They declare the glory of the Almighty; and, although without words and voice, they do not the less proclaim his power and glory."

However brilliant the stars disseminated through the immensity of space, Scripture never supposes them to be animated, as the ancients imagined. Neither does it assign to them any influence over human affairs. It regards them as bodies called forth out of nothing by the voice of God; as inert pieces of matter, regulated and submissive, proceeding with the order, regularity, and unity, of an army advancing to battle, and executing the decrees of his Supreme Wisdom.

It is thus that the Bible represents to us Him whose majesty is above the heavens, and who humbles himself even when he looks upon the celestial vault. Between the animated representations which it gives us of this Infinite Being, whom the universe cannot contain, and those which have been handed down to us by the greatest geniuses of antiquity, the distance is so great that no comparison can be instituted. It is the same with the notions Scripture gives us and what the ancient theogonies have transmitted respecting God, as with what regards the material world and its formation.

Scripture is not less exact when it describes the different constellations. It represents the Pleiades as owing their lustre to a great number of stars placed close together. It speaks, on the contrary, of the stars of Orion as remote from each other, and in some measure, as it were, dispersed through the celestial vault. In alluding to the brilliant constellation of the Great Bear, it represents it as composed of an infinite number of resplendent stars.

It is not only when considered in relation to these great views, that Scripture appears in harmony with the discoveries of science; the fact is even more conspicuous when we regard the phenomena of the material world in detail. Thus, when it speaks of the air, it represents it as possessing a certain weight, and surrounding the earth in movable layers. In fact, in that admirable song of Solomon's, where he describes the eternity of the Infinite Wisdom, does he not tell us that it existed when God established the air above the earth, when he assigned their equilibrium to the waters of the fountains, and laid the foundations of the earth?*

In like manner, Scripture first informed us, "That God gave to the air its weight, (*mischkal*), and to the waters their just measure."† Yet this property of the æriform fluid which surrounds the earth remained unknown till the time of Galileo and Torricelli. At the most, Aristotle had but a faint idea of it, just as, at a later period, Seneca had some notion of its resilience and elasticity.

This weight attributed to the air, has appeared so extraordinary to all the interpreters of the Book of Job, where it is literally stated, that, from not being able to comprehend it, they have altogether misinterpreted it. All of them have trans-

lated the expression *rouach*, which properly signifies the air or the æriform layer which envisions the globe, by the term *wind*, although they have preserved its true sense to the word *mischkal*, that is to say heaviness or weight.

They have been led to do this, because they were unable to conceive that the air could be heavy; and, knowing from experience that we encounter a certain resistance when moving against its beds or layers in motion, they have ascribed weight to it on account of its strength and power. Instead of following Scripture, and assigning to the air itself a certain weight, they have referred it to the agitation and impetuosity of its movable strata.

The above interpretation once admitted, all commentators who have followed the first translators have adopted the same version, without attempting to ascertain whether it was conformable to the true sense of the Hebrew text.

If the old interpreters had understood the true sense of the 7th verse of the 135th Psalm, they would have found in it an additional proof of Scripture attributing weight to the air. The psalmist there praises God, "Because he maketh lightnings for the rain, and because he causeth the vapors to ascend from the ends of the earth, and bringeth the winds out of his treasures." The ascent of the aqueous vapors in the midst of the air, is the consequence of their lightness being greater than that of the atmospheric strata through which they pass. Both the one and the other of them are, therefore, heavy, and the excess of weight is here in favor of that which, at the first glance, would appear destitute of it.

As they are regarded by Scripture, the aqueous vapors are the source of clouds, whence the waters descend which fertilize the fields, or lay them waste when they are too abundant. They are, therefore, the cause of impetuous rains and storms, when they afford a free passage to the lightnings of thunder. Scripture thus recognizes their density, and that of the æriform stratum which affords them access to the middle of its interstices.

The Bible thus represents to us the aqueous vapors as constantly suspended in the air, and nature, by an admirable system of circulation, as employing these vapors in the production of clouds, the source of the rains which fecundate the earth.* Scripture assigns to the atmosphere and to the upper waters, that is to say, to the aqueous vapors suspended in its bosom, an importance which modern science alone has been able to establish. At least, according to the calculation of the greatest natural philosophers, the force annually employed by nature in the formation of clouds, is equal to an exertion which the whole human species could not accomplish in less than 200,000 years.†

This "separation of the upper waters from the lower waters," has taken place by means of the atmosphere, and not by a solid sphere, as the greater number of the interpreters of Genesis have erro-

* See Job, chap. xxvi. 8; xxxvi. 27; xxxvii. 11 and 12; xxxviii. 25 and 37; Ps. lxxvii. 17; Proverbs viii. 28.

† The reader may consult on this subject the calculations of Leslie and Arago. The latter admits that about 800,000,000 of men form the half of the population of the globe. In the calculation, the result of which is given above, there would only be the half of that number engaged in the work destined for the formation of clouds, (*Annuaire du Bureau des Longitudes*, 1835, p. 196.)

neously supposed. In fact, the Hebrew word *rakiah*, which we have rendered by *interval* or *firmament*, is far from having the least relation to anything firm or indurated. It rather designates a vapory space, that is to say, an æriform layer, but by no means a heaven of metal, as Don Calmet has unreasonably imagined.

The Bible here indicates to us the importance of water in the formation of the earth. It further informs us that, besides the water diffused through the atmosphere, or which covers the greater part of the surface of the globe,* there exist quantities, not less considerable, in the interior of the globe. Its solid crust, it is stated, covers a great abyss: from this abyss the waters made a violent eruption at the period of the deluge, as at the time of chaos, and the innumerable ages which had preceded it.†

Thus the Sacred Scriptures, antecedently to modern discoveries, show us the exterior crust of the earth issuing from the bosom of the waters, and this same crust enclosing in its interior an immense quantity of water, in a liquid state.‡ These facts have been confirmed by observation and science. Is it not consistent with common experience, that subterranean waters are almost as abundant as those which flow on the surface of the earth? The globe would appear to contain in its interior, rivers, torrents, lakes, and perhaps even seas. When the Bible speaks of the deluge, it represents it as produced by impetuous and violent rains, the flood-gates of heaven being opened. On the other hand, it describes the waters enclosed in the bowels of the earth, as having gushed up to the surface in torrents. They swelled, at the same time, the exterior waters, which accumulated and overflowed on every side, according to the energetic expression of Job. All these causes united produced this terrible catastrophe, which brought destruction on the human race, and which was followed by their renovation.§ Such facts are still the cause, not indeed of deluges analogous to that the violence of which the Bible describes, but of inundations which afflict and desolate the earth at distant and rare intervals. The waters of the heavens are incapable of producing them, as they were incapable of causing a cataclysm, such as that which occasioned the destruction of man. In fact, the quantity of aqueous vapor diffused through the atmosphere is too inconsiderable to produce deluges resembling that of Noah, the extent of which physical facts sufficiently attest.

* Psalm civ. 25, makes us acquainted with the grandeur of the ocean in these terms: *This great and spacious sea.* Zechariah describes its extent by saying, the Messiah shall reign "from sea to sea;" that is to say, throughout the whole earth; Zechariah ix. 10. See Amos viii. 12; Micah vii. 12: Ps. lxxii. 8.

† See Genesis vii. 11; Ps. lxxvii. i; civ.

‡ According to Ps. cxxxvi. 6, the earth is founded and stretched out above the waters: *Quis firmavit terram super aquas?*—"The Lord has founded the earth upon the seas, and established it upon the floods," Ps. xxiv. 2; "*Les géants gémissent sous les eaux.*" Job xxvi. 5. [The French and German versions of this passage differ from the English translation.—Ed.] Moses wishes for Joseph, "the blessings of the deep that coucheth beneath," that is to say, abundance of spring water; Deut. xxxiii. 13.—[Several references are here made by the author to passages of Scripture, which he regards as corroborating his statements. These references, probably from typographical errors, are, in many cases, obviously incorrect, and are therefore omitted.—Ed.]

§ See Job xxxviii. 8; Genesis vii. 11 (*rupli sunt fontes abyssi et cataractes cæli aperiantur.*)

Scripture does not confine itself to these particulars, in order to enable us to understand that, besides the great masses of water spread over the surface of the globe, there exist others not less considerable in the interior. The earth is founded and stretched out, it informs us, on the subterranean waters: they are there assembled, as in a mass, in the most secret places of its depth, whence they at times escape to impart fertility to the most barren soils.*

Thus, when it describes the riches of the country of Canaan, to which a wonderful exuberance of vegetation is promised for the latter times, it represents it not only as abounding in springs and fountains, but particularly in subterranean waters. It seems thereby to anticipate the process of perforation, by means of which the moderns have succeeded in fertilizing the most barren fields and the most sterile countries.

We find, moreover, in the Scriptures, proofs of the extent of the seas in the early ages; they even contain some succinct details respecting the animals which inhabited them, the greater part of which have preceded the species of the dry and uncovered land. Such facts have required long spaces of time for their operation. In truth, the numerous generations buried in the old strata of the globe, and to which the present existing races have succeeded, must have lived during periods of greater or less duration, in order to fulfil the end of their creation. This circumstance of itself proves that the word *tom*, used in Genesis, and which is translated *day*, means rather indeterminate epochs, the duration of which it is impossible for us to fix.

While enabling us to understand the extent of the seas, Scripture does not fail to declare to us that God has marked out their limits, and has fixed their boundaries and barriers, which they cannot pass over. In its poetical style it exclaims, "Sea, hitherto shalt thou come, and no further; and here shall thy proud waves be stayed."

In other places it points out the depth of the sea, and refers to the greatness of its abysses, maintained by the waters which issue from the bosom of the clouds. The rains also quench the parched lands, and cause the grass of the meadow to spring. With regard to the waters, they are sometimes converted into ice, and become hard as a stone: their solidity thus accidentally gives solidity to the surface of the sea.

It represents the frost as spread over the earth like salt, and making the plants rough like the leaves of thistles. When the cold north wind blows, the water becomes as crystal. The frost rests on the whole mass of waters, and renders them like an impenetrable breastplate.

When the snow falls on the earth, it extends itself over it like a multitude of birds of passage lighting upon it in flocks; it spreads itself like hosts of locusts descending from the clouds. The eye admires the brilliancy of its whiteness; but the mind is alarmed at the inundations it threatens. Finally, when the bad weather ceases, the warm and moist winds become felt, and with them the snow and frost disappear. Thus, throughout, and at every step, Scripture indicates to us the influence of the waters diffused through space, and their effects on the earth.

The Bible, in order to give us an idea of the

* See Ps. xxiv. 2; xxxiii. 7.

influence of the central heat, does not confine itself to speaking to us of that which it exercised on the waters of the deluge; it gives us further information, when referring to the interior condition of our planet. In fact, according to it, if the surface of the earth furnishes to man the elements of his nourishment, beneath the solid crust, "The earth is," nevertheless, "on fire, and as it were turned up."* The greater part of its crust, thus inflamed in the interior, is covered with water on the surface. Above this liquid mass, continents and mountains, which are its most elevated points, have risen up to afford an asylum to man, as well as to terrestrial animals and vegetables.

Who, then, has informed Job that the interior of the earth was filled with such a burning heat? Who has taught him the existence of the central fire, the possibility of which Buffon had conceived before the hypothesis had become a demonstrated fact? We do not reply to this question, on account of the point of view under which we have considered the Sacred Books.

We have reason to be surprised at thus finding in the Bible physical truths so long misunderstood, or so long unknown; namely, the weight of the air and the central fire. Notwithstanding the existence of this interior heat, the effects of which it appreciates, Scripture does not fail to admit the extent and thickness of the solid crust of the globe, which encloses immense quantities of water concealed in its depths.

The Sacred Books, it is true, in giving us an idea of these great facts, has not taught us them in the language of natural philosophers. Their language is never that of Copernicus, Newton, Kepler, or Laplace. The reason which has prevented the authors of these admirable books from doing this, is one of the strongest that can be conceived. If they had expressed themselves respecting the scenes of nature, not as these present themselves to our eyes, but according to the notions which philosophers of a future age might form of them, they would certainly not have been understood, even by the most enlightened minds.

Besides, the most advanced language of science is almost in every instance only the language of appearances. The visible and material world is, to a greater extent than is supposed, a scene of illusions and errors. What we call reality is often a mere figure, having a relation to a more hidden reality, or to an analysis carried a further length. Such an expression, in our mouths, has nothing absolute in it; it is a relative term, which we employ in proportion as we believe that we have ascended a new step in the profound scale of our ignorance.

Above all, it was necessary that Scripture should be intelligible to the most vulgar individuals, as well as to the most learned. Let us not, therefore, be surprised that it expresses itself according to the habitual and familiar language of science, and that, with it, it speaks of the stars rising, the equinoxes retiring, the planets advancing and doubling their speed, standing still, and moving backwards. We need no longer be surprised that it speaks of the rising and the setting of the sun, since these modes of expression are

sanctioned and adopted by the *Annuaire* of the bureau of longitudes.

One circumstance may well surprise us, and that is, to find in the Bible mountains distinguished into two classes, very nearly in the same manner as they are distinguished by science into primitive and secondary. Thus, in the 104th Psalm, a composition of incomparable poetical beauty, the prophet gives us an idea of the formation of the earth; he represents it to us as still covered with the waters of the deep as with a garment. The waters stood above all the mountains, but many of these eminences became elevated, and rose above their level; the waters then retired and fled. New mountains then appeared, and valleys and plains, the lowest parts of the globe, were formed at their feet. Two principal epochs, then, must have been in the mind of the prophet, from the time of the rising up of the heights which appear on all parts of the globe; these two epochs correspond to the formation of primitive and secondary mountains.

Thus the prophet (Proverbs viii. 25) in speaking of the elevation of mountains and hills, says that these events, which have singularly modified the relief of the globe, had their separate eras. Further, in the 97th Psalm, Scripture represents the mountains to be melting like wax, nearly as those might have done who had seen the rocks of Auvergne or Cantal in a fluid state, or the basalt of the Giant's Causeway melted like water.

The Bible then represents to us the mass of mountains issuing from the bosom of the earth at the voice of God, and rising above the plains and valleys. It gives us an account of the process of their elevation, in terms which might have been used by a poetical geologist. "The mountains," is the enthusiastic language employed, "the mountains rise above the deep, and the valleys sink to the place which thou hast chosen for them."

Reference is even made to the force by which they have been elevated; it is represented as proportionate to the elevation to which these eminences have been raised, being most powerful when employed in elevating the mountains properly so called, and weaker when its efforts were limited to the raising of the hills above the valleys. In its figurative style, it compares the elevation of the former to the skipping of rams, and that of the second to the leaping of lambs.*

The earth is thus represented as being soft as clay, at the time of these great events. It is then described as having assumed a new face, and having adorned itself with a new garment,† a sort of allusion to the sedimentary deposits with which the superficial crust became covered.

When Scripture speaks of the electric fluid, it represents it to us as resounding throughout the whole space of the heavens, and causing its lightnings to shine even to the remotest parts of the earth. After their light the thunder roars, and its rolling sound is heard. The noise of the thunder, it says, announces that the wrath of God is about to fall on all that aspires to elevate itself. Scarcely has the sound been heard, when the bolt has already struck. Thus God breaks forth in the voice of his thunder; he who works such great and

* The Hebrew word *thakhethejah*, used by Job, chap. xxviii. 5, means *beneath it*. The text runs, "It is from the earth that bread comes; and beneath it, it is turned up, and as on fire."

* See Job xxviii. 4; Psalm xc. 2; xcvi. 5; civ. 6, 8, 9; cxliv. 5; Proverbs viii. 25; Ezekiel xlvii.; Zechariah xiv. 4, 8.

† See Job xxxviii. 14.

mighty wonders, traces his path in the thunder, and regulates the course of the tempests.

Such is the idea which it gives us of this phenomenon, the rapidity of which is even greater than that of light. In fact, according to Mr. Becquerel's experiments on the rapidity of electricity, this fluid traversed ninety thousand leagues in a second. Its velocity is therefore greater than that of light, which is only at the rate of eighty thousand leagues in the same space of time.

The electric fluid not only exhibits the greatest velocity, but it enters in considerable quantity into the composition of the molecules of bodies. This quantity is indeed so immense, that the imagination is startled at it. The elements of a simple molecule of water appear to contain eight hundred thousand charges of an electric battery of eight jars two decimeters (about 8 inches) in height, and six (about 2 feet) in circumference, obtained by thirty revolutions of a powerful electrical machine. If the quantity of electricity accumulated in the elements of a gramme (about 15½ grains) of water, happened to be suddenly set free in the middle of any building, the building would instantly be blown in pieces.

This power, compared with which steam is as nothing, whether we consider it as an extremely subtle matter, or rather as the result of a vibratory movement impressed on the ether, is only employed by nature in maintaining the combinations and molecular constitution of bodies. We ought not, therefore, to be surprised at the importance which Scripture assigns to thunder and lightning, which is one of the not least curious of its effects. There are few natural phenomena in which electricity does not act a part, and which are not more or less dependent upon it. How can it be otherwise, since each material molecule appears to be endowed not only with a certain quantity of heat and light, but also with electricity?

Genesis is not less exact when it calls our attention to the living beings which, by turns, have animated and embellished the surface of the earth. It delineates their succession, it teaches us that they have appeared in distinct generations, and in direct relation to the complexity of their organization. We are surprised to find such a law written in the Bible, a law equally to be traced in indelible characters in the bowels of the globe. This fact, clearly expressed in a Book which has existed from so old a date, has, notwithstanding, been known to us only for half a century. To the general idea thus connected by Moses with the appearance of living beings, this great legislator adds details, the accuracy of which is not less evident in our opinion, although assertions to the contrary have been made by many illustrious naturalists. According to him, terrestrial vegetables preceded the animals which inhabit the dry and uncovered land. In this particular, chemistry confirms the assertion of the sacred writer; but geological observations seem to be opposed to it. Accordingly, certain modern natural philosophers, far from admitting it as real and satisfactory, have regarded it as a manifest error. The question is to determine whether these observations are as conclusive as they are supposed to be, and if, according to the nature of things, vegetables must not have appeared before animals.

The researches by means of which it has been supposed possible to prove that vegetables have not preceded beings endowed with motion, are far from authorizing the inference wished to be de-

duced from them. In fact, while terrestrial vegetables appear in great numbers in the transition formations, this is far from being the case with animals. Only a few individuals of the lower classes of the animal kingdom have been discovered in them; up to the present time the number does not exceed six species at most. And yet the most active researches have been made in all parts of the world to discover a greater number. But even although these beings had been observed in the same terrestrial strata, this would not have been a proof that they lived simultaneously. We are unacquainted with the time which may have been necessary for the precipitation of these ancient strata, as well as for their consolidation. Hence plants, although anterior to such or such species of animal, may have been embedded along with it in the same order of deposit, the latter having required more or less considerable intervals of time for its formation.

There is, therefore, more or less uncertainty with regard to the simultaneity of the period of the appearance of vegetables and animals, if we suppose that both were interred in formations of the same age. It is far from being demonstrated that terrestrial plants are not found in strata more ancient than those in which we discover animal species. Geological facts do not, therefore, contradict the progression indicated by the author of Genesis, in regard to the appearance of different living beings. This assertion of Moses is a geological consequence of high importance, confirmed by the observation of facts, as has been remarked by one of the greatest natural philosophers of our day.*

This consequence is, moreover, a rigorous, because it was a necessary one. Terrestrial animals derive their food from vegetables, even such of them as subsist on living prey. By devouring herbivorous species, they, in fact, support themselves by means of the herbaceous matter which these latter had assimilated and converted into their own substance. If, then, the herbivorous must have existed before the carnivorous races, to which they were to serve as food, both the one and the other must have been preceded by the plants which were to afford them the means of growth and development. By a consequence of the same kind, we may admit that omnivorous animals must have appeared last among living beings.

This conclusion, at which we arrive by a process of simple reasoning, is confirmed by observing the strata of the globe. It is remarkable to find this fact recorded in Genesis, written at least 3500 years ago. This book admits, in like manner, the gradual appearance of vegetables. It makes them commence with the least complicated species, to which succeed herbs, then shrubs, and finally trees. Posterior to all animals the sacred writer places the arrival of man, who crowns and terminates the great work of creation.

Naturalists who have occupied themselves with this question, have not examined it with the view of justifying the author of Genesis; and this very consideration gives their opinion greater weight, for it has been forced on their minds by positive experience.

It is to this part of the subject that Herschel's beautiful thought is more particularly applicable. Struck with the relations which the sciences are every day contracting with revelation, he says;

* M. Dumas.

"that all human discoveries seem to be made only for the purpose of confirming more strongly the truths come from on high, and contained in the sacred writings." This illustrious astronomer has seen in this agreement the most valuable triumph and most noble conquest of intelligence.

This scientific fact may be regarded even in a still more important light. It indicates that the author of Genesis has had just reason to look upon man as the last that appeared of living beings, and to regard him as the limit and completion of the creation. If plants have preceded herbivorous animals, because the latter must derive from these all that serves them for nourishment, herbivorous animals must, in like manner, have appeared before the carnivorous species. In truth, without the herbivorous races, the carnivora must have died of hunger. For similar reasons the omnivorous, or such races as live both on vegetables and animals, must have made their appearance at a later period. Accordingly man, who is omnivorous *par excellence*, must have appeared last among living beings, since he requires the presence of all kinds of nourishment.

On the other hand, when Scripture speaks of the creation of plants, it makes them vegetate and develop themselves before the appearance of the sun, and under conditions of light, heat, and humidity, different from those under which vegetables now flourish. It has thus disclosed to us, thousands of years ago, an order of things which the fossil botanist has found to exist with great exactness, and which he has endeavored to explain by causes different from those whose action is now felt.* Scripture, therefore, has admitted, with reason, that the germination of vegetables commenced before the sun had received the power of shedding his light on the earth; it is thus by motives not less legitimate, and not less real, that it makes plants appear before animals, which they were destined to supply with nourishment. But let us consider whether Scripture has had equal reason for proclaiming the recent appearance of the human species as compared with other living species.

What we have already observed, is in some measure a proof that the arrival of man on the earth must have been posterior to that of the greater part of animals, whether vertebrate or invertebrate. Not many serious difficulties can be formed on this point. The examination of fossiliferous strata proves that the remains of our species do not begin to show themselves till we come amongst diluvial deposits, which are the most recent of those belonging to geological eras. Man has, therefore, formed part of the new generations which have appeared on the surface of the earth; also the greater part of those with which he has been cotemporary have still their representatives among the living races.

But man may be recent, even the newest of beings, and yet the date of his appearance may go so far back as the 7500 years which Scripture assigns to him. Is it necessary to suppose with Scripture, that the last arrangement on the surface of the globe is more recent than the last and terrible catastrophe which laid it waste, a catastrophe followed by the renewal of the human race? Would it be reasonable for all ages, all people, and, in particular, our modern schools, to set

themselves in opposition to a date which assigns so youthful an age to our haughty race? Assuredly not; geological investigations, the researches of history, and the study of monuments, all concur in demonstrating not only the recent date of man's appearance, but particularly that of his renovation.

Here, therefore, Scripture is exact and within the limits of truth. The term it assigns to the cradle of humanity, although not very remote from that in which civilization has arrived at a degree of remarkable splendor, is still sufficient to explain and comprehend the various phases of it. We may include in these 7500 years all that authentic historical traditions have told us respecting the progress of man in the path of civilization.

The Bible has, in like manner, acknowledged the unity of the human species. This truth, for a long time disputed, has been regarded in our own times both by the most illustrious physiologists and most able anatomists as fully established. The intimate acquaintance of both these classes of observers with the proofs which demonstrate it, gives the greatest authority to their opinion.

At some future period, not very remote, this question will probably cease to be open to any dispute. In fact, the black men who, by losing ground and going backwards in the path of civilization, have lost, in a great measure, the beauty of their primitive type, are now returning to the blessings of intelligence, and have established themselves as nations. They show a tendency to remount to the point from which they receded: as the consequence of their progress in knowledge, and the improvement of their mental faculties, they will soon recover the type which they had lost. The development of their brain, the necessary consequence of the exercise of their minds, will make them acquire new forms; and soon they will cease to be distinguishable from the white race from which they sprung. With the advance of their intelligence, their language will become purer; their manners will undergo a corresponding improvement; and these men, not long since so debased, both in moral and physical qualities, will become the most manifest proof of the unity of the human species, as proclaimed by the first and most ancient historian.

This primitive unity must necessarily imply a uniformity in the language of mankind, or in the manner of making themselves understood, and communicating their thoughts to each other. The Bible intimates this; and we can go back with it to the precise period when the confusion of languages took place among the nations. A superficial study of the idioms of the primeval races has appeared, at first view, not very favorable to the idea of their having a common origin; but a more profound examination has shown in what manner all the languages spoken came gradually to differ from each other. (*See note at the end of this article.*)

It is not less deserving of attention that the Bible is the first book in which we find notions of classification, analogous to those which naturalists employ in the study of the different natural bodies. In the 11th chapter of Leviticus, in particular, we find a sketch of a method of distinguishing pure animals from impure, the latter of which the Hebrews were forbidden to eat. God allowed the children of Israel to eat animals which ruminated and had the feet cloven; but they were interdicted from using others. Swine, and even camels,

* See Genesis i. 11 and 12; and our memoir on the Fossil Plants of the Coal Formation of the Polar regions, *Bibl. Univ.*, July, 1834.

were included in the interdict; the former because they did not ruminant, the latter because they had not their feet divided like oxen and sheep.

Birds of prey were also, according to Scripture, impure animals, which the Hebrews were not permitted to use for food. They were allowed to make use only of long legged species (*Grallæ*, Linn.) and those whose feet were adapted for swimming. They might employ for food all the marine and fresh-water fishes provided with scales and fins; but they were not to eat such as were destitute of these appendages. In this ordination there can be no doubt that a great degree of wisdom is shown; for the animals we now use for food belong to pure species; while, with the exception of the hog, those which Moses regards as impure, are, in general, ill-fitted for human consumption. But what is most important to be remarked is, that in this arrangement there can be traced the basis of a natural classification, which is still adopted in the most common systems.

Scripture is not less precise when it turns its attention to the objects of detail relating to living beings. It is, in particular, in delineating the manners of animals, that these writings exhibit an accuracy and conciseness which the greatest naturalists have not surpassed. Its descriptions are so faithful and so precise, that they cannot be mistaken. Thus it represents to us the lioness couched in her cave, watching with a restless eye the prey about to pass, and waiting with the utmost anxiety on her young whelps. When she perceives the prey, we are told how she darts forth with the rapidity of the eagle, carrying her victim in her mouth to appease the hunger of her young ones. Very different from the young lions, the young ravens wander about from one place to another, oppressed by hunger; they call with loud noise on their mother, who finds her greatest delight in supplying them with food.

It indicates to us, in like manner, the time of gestation and delivery of the hinds and wild goats. These animals are represented as bowing themselves when they bring forth, and uttering sorrowful cries. The wild ass is spoken of as being singularly fierce, incapable of being subdued, and answering not to the voice of him who calls himself its master; free, and ranging the mountains as his pasture; his abode is in solitude, and his retreat the desert.

Man, it tells us, cannot subdue the oryx; he cannot force it to remain even for a single night in a stable; still less can he make it submit to the yoke, to open the furrows and harrow the fertile valleys. Notwithstanding his power, the strength of man is incapable of making this untamable animal assist him in his labors. He cannot make use of it to carry his harvests, or to gather them into his barns.*

* See Job xxxix. 1 to 11. We shall make only a single observation on these verses: it relates to the animal which the Hebrews called *Reem*, perhaps the oryx of the Greeks, spoken of by Martial and Oppian. This species appears to be the same as the Oryx antelope of naturalists; it is about the size of a stag, and its horns are slender, from two to three feet long. This antelope, or oryx of Elian, lives in large herds in the interior of Africa, and throughout the whole of Arabia.

M. Rosenmüller, as well as Bochart, has translated the Hebrew term *Reem* by oryx, with so much the more reason, because the notion of the unicorn has been formed from some individuals which had lost one of their horns. This circumstance is the more probable, since the oryx presents this peculiarity, as well as the algazel and

The delineations of the manners of these animals are extremely true, and are expressed with remarkable conciseness. Such is the case with those the Bible gives us respecting the habits of the ostrich, a bird which it represents as void of affection for its young, which are in its eyes as if they were not its own. Forgetting her offspring, the ostrich leaves her eggs in the earth, and warmeth them in the dust. A foolish and thoughtless mother, she cares not what may become of them; forgetting that the foot may crush them, or that they may be destroyed by the cruel jaws of the tigers of the desert. But when it is the proper time, she raises her wings into the air; trusting to the strength of her legs, she scorneth the horse and his rider.*

The description of the horse is not less faithful: the Bible represents it to us as full of strength and vigor, and bounding like a grasshopper. His neck is adorned with a flowing mane, and he paweth the earth with his foot. He leaps forward with pride, and goeth forth to meet the armed men. His breathing scatters terror; he mocketh at fear, neither turneth he back from the sword. When the quiver rattleth against him, the glittering spear and the shield, he swalloweth the ground with fierceness and rage. If he hears the sound of the trumpet, he exclaims, Let us advance; he smell-eth the battle afar off, the thunder of the captains and the shouting.†

At the command of the Eternal, Scripture states, the hawk darts into the air, and extends her wings towards the south. At His voice, the eagle rises to the clouds, and places her nest on the top of the mountains. This bird inhabits the hollows of the rock, and dwells in the most inaccessible cliffs of the crag. From these elevated heights the eagle watches her prey; her piercing eyes discover it afar off. When she has seized it, she carries it to her young, who drink its blood. Under the guidance of their mother, the young eaglets soon descend to the places where the carcass lies. Images of death, these birds bear, in some degree, its livery on their plumage.‡

Scripture often makes mention of the migrations undertaken by so many animals, particularly birds and fishes. It often compares the rapidity of birds

leucoryx antelopes: all of these animals frequently become unicorn.

However this may be, the details which Scripture gives us respecting the animal which it calls *Reem*, agree perfectly with the Oryx antelope. See our *Observations on the Unicorn of the ancients (Mém. de la Société Linné de Bordeaux.)*

* See Job xxxix. 13 to 18. The description of the ostrich in the book of Job is remarkable for its extreme truthfulness, as may be seen by perusing the passage referred to. It is singular to see in so ancient a book this habit of ostriches noticed, of raising their wings into the air when they wish to run before the wind. They know, by instinct, that their wings, under such circumstances, will act as sails or oars.

† See Job xxxix. 19 to 25. This description of the horse is superior to all others that have since been written.

‡ See Job xxxix. 26 to 30. The Hebrew word *nescher* (eagle) is derived from the verb *schour*, which properly signifies to contemplate. The authors of the Bible were not ignorant that the eagle could fix its eyes on the sun. The prophets had also correctly observed that when the eagle moults he loses almost all his feathers (Micah i. 16.). Scripture is not less correct, when it speaks of the manners of animals. See, for example, Proverbs xxx. 25 to 28; Isaiah xxiv. 14 and 15. The Proverbs contain details not less curious on inanimate bodies. Ezekiel (iii. 9, and x. 1) had remarked, that the diamond was the hardest of stones, as the sapphire was one of the most brilliant. Zechariah, likewise, when wishing to describe

of passage, as they cross the seas, to the speed of vessels using their large sails as if they were huge wings. It shows to us the extensive journeys performed by these light inhabitants of the air, their immense numbers, their fatigues, the consequence of their lengthened flight, and the promptitude with which they alight when they reach the end of their journey. Everything, in the delineation of the manners of these birds of passage, is rapid and animated as the movements themselves of the beings which people the aerial ocean.*

We have enumerated some of the principal physical facts contained in the Bible; we have endeavored to show the relations they bear to those with which science has recently made us acquainted. It seems that nothing now remains for us to ascertain. There is, however, one essential point of which we have omitted to speak, and with this we shall terminate our researches. The Book of Wisdom, after having said that the almighty hand of God made the world out of nothing, adds, that he disposed all things by number, weight, and measure. By this we are led to understand, that we ought to consider natural bodies under three aspects; that is to say, under that of their extent, their weight, and the number of atoms or molecules which compose them. Perhaps it was thus meant to specify the principal modes of regarding bodies, or the principal branches of natural sciences. Physics would, in this way, be represented by measure, the mathematical sciences by number, and chemistry by weight.

Scripture describes, in a few words, the principal properties of bodies, and how we may sum up their different appearance and different characters. Thus God asks Job where he was when he laid the foundations of the earth, and when He established the measures thereof? where he was when He enclosed the sea with barriers, when it broke forth as a child which comes from the womb of its mother? or when, enveloping the clouds as with a garment, He surrounded it with darkness like the swaddling-bands of infancy? Has man ever known the paths of light, or the place of darkness?

The details into which we have entered seem to prove, with some degree of evidence, that the physical truths most essential to the knowledge of the material world, are almost all indicated in the first books of the Bible. They are never, indeed, fully developed, because Moses and his successors were not called upon to write scientific treatises. While speaking of God, and the works which proclaim his power, they have, as if in spite of themselves, allowed some gleams of their superior knowledge to break through. Their object, and almost their sole object, has been to point out their duties to the people they were called upon to direct, and, particularly, to fill their minds with the fear of the Lord. It was sufficient to unveil to them the principal facts of this visible world, to convince them of the wisdom of the Most High, so clearly imprinted on the works he has produced.

the impenitence of the Hebrews, says that they have hardened their heart like the diamond (vii. 12.) This prophet was also acquainted with the mode of trying gold and purifying silver (xiii. 9.) The 28th chapter of Job contains interesting details on the metals and precious stones.

* See Isaiah xlvi. 11; lx. 8; Hosea xi. 11; Joel ii. 28; also the Psalms.

Explaining them, accordingly, with an admirable conciseness, the greater part of these facts have escaped the notice of the first interpreters of Scripture, who, from inability to comprehend them, have not given to the sacred books all the importance they now possess in our eyes. Their errors, altogether involuntary, are so much the less to be wondered at, since the Bible contains particulars for which we cannot yet assign a reason in the present state of our knowledge. The constant progress of human science will soon render them intelligible. This is not the least of the advantages of the sciences, nor the least valuable inheritance we can leave to our descendants. They will not forget, more than we, that Scripture is a treasure open to all; and that it is the only book from which those that borrow run no risk of being accused of plagiarism. The ideas which they may draw from it have already belonged to millions of intelligences; but if they extend them, if they understand them better than their predecessors, they will so much the more belong to them, since they shall have been the first to perceive them.

Note.—We read, in Genesis xi. 1, *Erat autem terra labii unius et sermonum eorundem*, which may be translated thus:—"There was then upon the earth only one language and one speech." The unity of the primeval language is perhaps more difficult to establish than that of the human species. In fact, we are without the most essential data for solving the question. We shall, therefore, confine ourselves to a few observations.

If all the varieties or different races of men are derived from one stock, it follows, almost as a necessary consequence, that this must also have been the case with their language, however diversified it may be. Now, it is almost demonstrated that the white race is the most ancient. We ought, therefore, to find among the idioms used by this race this preëminently primitive language—the mother of all the rest.

The proof of the primitive unity of language is to be found, not only in the unity of the human species, but also in the confusion of languages which took place at the building of the tower of Babel. If confusion took place then, it could not have existed before.

The history of the human race informs us, that at its origin there was only one speech (*unus sermo.*) But it is difficult for us now to go back to that primitive stock, from which have sprung the various idioms which the different nations of the earth employ to express their ideas. All that is proved by the study of their characters, structure, and construction, is, that the most diverse among them have a family air and resemblance, which reveals a common origin.*

If we assert the contrary, we shall be forced to establish as many human races as there are idioms without analogy or mutual connection; that is to say, we should have to establish hundreds. This consequence would not be very philosophical; it would oblige us, at least, to multiply the races almost in the inverse ratio of the number of individuals who formed part of them. In fact, the

* The knowledge of this primitive language is of no consequence to Scripture; it only interests philosophers. The Bible, accordingly, contains no details in regard to it.

smallest tribes, and the most subdivided of savage nations, often present the most notable and strongly marked differences in their languages. As the consequence of this state of things, the interior of Africa, or the unexplored regions of Australia, would contain a greater number of races than the whole of Europe or Asia. The same thing would hold true of America, where, however, it appears to be demonstrated, that the numerous languages of the natives are derived from a common stock, these having been subjected to the laws of other families of spoken languages.

The most recent researches on the construction of different idioms, seem to have rendered it probable, that, after the violent separation of the human species, they formed themselves into groups, or, if the term be preferred, into families. These groups daily tend to approach each other, and thus more and more indicate their paternity and mutual affinities. They thus present the best proof of their first and single point of departure; they divide the human species into certain great characteristic families, the subsequent divisions of which come within the domain of history. These analogies and relations will become more and more apparent, in proportion as the philosophical study of nations, and the knowledge of their diverse idioms, acquire greater certainty and fuller development.

The languages which form the Semitic branch, in which may be included Hebrew, Chaldee, Phœnician, Syriac, Abyssinian, and Arabian, have been long recognized as having a common origin, and composing a great family.

The same thing may be said of the Chinese and Indo-Chinese languages, which compose a single group, in which all the monosyllabic languages of the east may be included.

With regard to the idioms known under the name of Indo-European, they compose a great family, including the Sanscrit or ancient and sacred language of India; the ancient and modern Persian, which was at first considered to be a Tartar dialect; the Teutonic, with its diverse dialects, such as the Slavonic, Greek, and Latin, with its numerous derivatives. The Celtic dialects, which, according to Prichard, have the closest relation to the Indo-European languages, must be arranged in this group.

Although the Sanscrit may appear, at first sight, to be a mother language, and to have only remote analogies with those which are somewhat modern, we arrive at another conclusion when we compare, with some attention, the Sanscrit and the Greek, for example. This examination is found to prove that numerous relations exist between these two idioms, which would at first appear to have nothing in common. Some curious details on this point will be found in a notice placed at the head of Burnout's Greek Grammar.* Similar analogies are observable between the Sanscrit, the Persian, and all the old and new dialects of the north; as is also found to be the case between the first of these languages and the Hebrew. We shall find the proof of this assertion in the excellent German work published by Bopp. This skilful philologist has there compared all these languages with the Sanscrit. Now, as the Greek also appears to be derived from it, judging from the great number of words common to the two idioms,

it will follow, that all are derived from one and the same language.

The same thing would appear to be the case with the most ancient languages, such as the Hebrew, the Chaldee, the Phœnician, the Syriac, the Abyssinian, and the Arabic; among which may be included the Egyptian, the affinity of which to the Hebrew is not less manifest. The analogies of all these idioms are so numerous, that, according to M. Cellérier, a great number of modes of speech and foreign terms of expression, principally Arabian, are to be found in the Book of Job. He assures us that he has counted eighty-five words in that book which are not to be met with in any other of the Old Testament books. He has also noticed in it twelve Syriac expressions, eighteen Chaldean, and fifty-three Arabian. This observation, however, applies only to the poetical part; the prologue and epilogue are written in Mosaic Hebrew, and in the ordinary narrative style. (*Introduction to the Old Testament*, p. 494.)

The Latin, which, like the Greek, has a close relationship to the Sanscrit, is evidently a derivative and secondary idiom. The greater part of those of Europe, such as the Italian, Spanish, English, and French, are derived from it. At least, they exhibit such striking resemblances, and such numerous agreements, that it is easy to recognize in them the traces of the language from which they have been derived.

It is difficult, therefore, in the actual state of things, to go back to the primitive stock from which all spoken languages have sprung. All that can be done, is to recognize affinities, more or less strongly marked, between them, and to detect, as it were, distinct groups or families. Notwithstanding the great differences observable between certain idioms, we conclude, after an attentive examination, by discovering in them certain characters which reveal a common origin, and a primary and single stock.

The exertions of the most illustrious philologists of our times, have been directed to this important point in the history of language. Their researches on the signs, the structure, and construction of the numerous idioms which mankind have employed to communicate their thoughts, have proved, beyond a doubt, that these constitute distinct groups and many great families. Yet, they have found in them, considered collectively, too close analogies, and too obvious affinities, to admit of regarding them otherwise than as all derived from a single and primitive stock, or a mother language.

This appears so much the more probable, when we consider that we often discover stronger resemblances between the idioms spoken by nations situate at great distances from each other, than between those used by neighboring tribes. This occurs at times, even between nations who have no historical connection, and who, accordingly, can afford us no reason for affinities existing between their respective languages. Klaproth, in his Asiatic Memoirs,* has mentioned numerous examples of these singular resemblances.

If, as the most eminent scientific individuals have supposed, the origin of language depends on the faculty given to man to express his thoughts by means of words and particular characters, this faculty must be indefinite. It would, in fact, be

* See page 10 of the 37th edition. Paris, 1842.

* Paris, 1824, tome i., p. 214.

pear to be so. This circumstance may permit us to conceive the numerous alterations and modifications which language has undergone; modifications of such a nature that often the words of one idiom belong to one class, and its grammar to another. Even a new language sometimes results from this, differing from that whence it is derived, and further distinguished from it by the adoption of new grammatical forms altogether peculiar to itself.*

From the Examiner.

The Life of the Rev. Joseph Blanco White, written by himself; with Portions of his Correspondence. Edited by JOHN HAMILTON THOM. Three vols. Chapman.

THIS book is properly described by its editor as the materials of an autobiography, rather than the completed work. It is in three parts. The first strictly autobiographical, containing a narrative of events, and addressed to the writer's friend, Doctor Whateley. The second, entitled "A Sketch of my Mind in England," going over much of the ground of the autobiographical sketch, and shaped into a history of the writer's religious experience. The third, and most extensive, made up of journals, note-books, and correspondence. Mr. Thom has discharged his duty to his friend with manifest care and affection; and though the arrangement tends to a little confusion and repetition now and then, the subject of the book is from first to last very faithfully reflected. The omission of occasional redundancies, and the intrusion of editorial matter, would not in this respect have improved it.

Blanco White was a name well known in London and Oxford society twenty years ago. It was never doubted, we believe, that he was a sincere man; though he passed for a very "crotchety" one. This book will improve his reputation. There is much in the peculiar construction of his mind—in its close union of the moral with the intellectual faculties, and in its restless desire for truth—which may remind the reader of Doctor Arnold. Both have, in an unusual degree, what the French call *caractère*: a word of more meaning than the analogous one in English.

The outline of Blanco White's life is curious. He was a Spaniard; his father of an Irish stock, his mother Andalusian; and born in 1775, at Seville, at that time the most bigoted town of Spain. His family were engaged in mercantile affairs, and formed a sort of small Irish colony in Seville; but misfortunes overtook them, and his mother, a religious enthusiast, took Blanco from the merchant's desk and devoted him to the Roman Catholic church. This false step colored his future life. Strongly disinclined to religious discipline, his mother's influence prevailed against repeated attempts to disengage himself from it. He took priest's orders in the Colegio Mayor, was elected rector of his college, and became one of the chaplains of the Chapel Royal of St. Ferdinand. But by the time he had attained this rank in his church, its degrading influences were so bitterly felt by him, as well for other members of his family as himself, that he saw no alternative between infidelity or flight. He chose the latter, and came to England in 1810.

* From the *Bibliothèque Universelle de Genève*, No. 106, 1814, pp. 321-356.

He was imperfectly acquainted with the language, was without resources, (the political troubles of Spain having further involved his family affairs,) and without a friend. But he had known Lord Holland in Spain, and that generous nobleman became his active patron. He was enabled to establish a Spanish journal; conducted it till the expulsion of the French in 1814; and received a pension of 250*l.* a year from the foreign office. Then he seems to have set himself to that arduous task of reëducating himself in English, which gives peculiar interest to his life. He literally *recast* his mind in an English mould; in a few years never thought but in English; and wrote an admirable English style, strong and simple.

But having for this purpose fixed his residence in Oxford, a sort of evil religious destiny awaited him there. In the High Protestant Oxford party, his vehement southern temperament recognized what he thought the temple of his youth's religion renovated and purified; the priest revived in him; he set himself to new examination of the Christian religion, and became an ardent member of the English Protestant Church. We observe at this time the affectionate care and forethought of Lord Holland, in an effort to bring him back to the quieter paths of literature. His friendly kindness forced him into Holland House with the office of tutor to the present lord; but after two years he flung off the generous restraint, and threw himself headlong into religious controversy. He wrote the *Dobledo Letters*, assailed Charles Butler's *Book of the Church*, and in a work called *Internal Evidences against Roman Catholicism*, declared himself against Catholic Emancipation. Southey exulted, and Allen grieved. Keswick bid him God-speed in his glorious efforts; while Holland House reproached him that after all his efforts to divest himself of the rage of Popery, the mantle of Father Torquemada should be still cleaving like the shirt of Nessus.

It is very evident, however, that no man could have been more sincere than Blanco White at this time. He wrote what he plainly felt; and without care of what its help to bigotry, or to his own fortune, might be. He seems unaffectedly amazed when Oxford straightway creates him a master of arts, and the Duke of York gives him a commission for his son, (whose birth is one of the mysteries unexplained in the volumes.) He became a clergyman of the English church, and preached both in London and Oxford.

We suspect that Blanco's first grave doubt of the course he had taken came with his unlooked-for worldly rewards. His nature was not suspicious of others; but it was querulous to a painful degree in things affecting itself; and sensitively alive to what the world might think, and people say. Nor did he mend his position by voting, four years later, for Peel's reelection at Oxford. But there seems no reason to doubt that his Oxford life was a reasonably happy one. He made friendships in the common room of Oriël which survived the changes of his after life. He corresponded with Southey and Coleridge; explained the Roman Catholic breviary to Pusey and Froude; had a high and earnest delight in intercourse with Newman and Whateley; started a review of his own because Murray was starving his *Quarterly* contributors; and was cheered in its failure, as in every other failure or calamity he met with, by the un-failing kindness of his friends at Holland House, and their delicate and generous sympathy. It was

a remark of his when near the close of his life, that he could not see the mere handwriting of Lord Holland without a sudden expansion of his heart.

Blanco White left Oxford when Whately went to Dublin. The archbishop prevailed with him to accept a home in his family, and during this happy residence with the Whatelys he published his well-known answer to Moore's *Travels of an Irish Gentleman in Search of a Religion*. But what he saw of the Protestant clergy in Dublin was not of a kind to settle a wavering faith; doubts recurred he could not cope with; and in the course of remonstrance with a friend who had turned Unitarian, he turned Unitarian himself. A question of his absolute sincerity cannot be raised. He proved it by the most painful sacrifices; by what we must even call heroism, of a noble and touching kind. The truth was that his mind had never recovered the first shock of the Jesuit discipline of Spain; it had rushed to a compromise, and compromises only last for a time. He left the friends who were so dear to him; and passed the remaining five years of his life at Liverpool, among strangers who became friends.

Here his health, always feeble, gave way completely, and he was seldom free from grievous suffering. It is due to him to say that no mental conflict increased its pains. Of his new faith he had no doubt or misgiving; it sustained and kept him hopeful to the last. His letters to his old Oxford friends are beautiful: particularly those to Newman and Hawkins, (Arnold's friend, the provost of Oriel.) Still more beautiful is the conduct of the best of his old friends to him. By whomsoever these volumes may be read, the name of Whately will hereafter be less associated with logic, rhetoric, and learning, than with those noble and delightful traits of personal character which, connecting and elevating the whole human race, warm and endear us all to each other. To nothing of this was Blanco insensible; and in spite of his pains, and of a sort of desire to cleave to martyrdom, the kindness of his Whatelys, Baden Powells, and Lord Hollands, true and unswerving to the end, gave him not a few happy days in his last five years at Liverpool. He wrote to John Mill and for the *London and Westminster Review*. He published *On Heresy*, and everywhere avowed his change of belief. He maintained a long and regular correspondence with Doctors Norton, Tuckerman, and Channing, of America. He waited steadily for death, and met the awful change with cheerful resignation. Among his last prayers was one that God would relieve the world from all established priesthoods. He died in 1840.

We have left ourselves no space to illustrate this sketch by extracts from the volumes at present; but we will take another opportunity of showing the character of their contents, and the occasional passages of criticism and reflection which relieve their more prominent details.

MRS. CAUDLE'S DEAR MOTHER.

"Is your cold better to-night, Caudle! Yes; I thought it was. 'T will be quite well to-morrow, I dare say. There's a love! You don't take care enough of yourself, Caudle, you don't. And you ought, I'm sure; if only for my sake. For whatever I should do, if anything was to hap-

pen to you—but I won't think of it; no, I can't bear to think of *that*. Still, you ought to take care of yourself; for you know you're not strong, Caudle; you know you're not.

"Wasn't dear mother so happy with us, to-night! Now, you need n't go to sleep, so suddenly. I say, was n't she so happy! *You don't know!* How can you say you don't know! You must have seen it. But she always is happier here than anywhere else. Ha! what a temper that dear soul has! I call it a temper of satin; it is so smooth, so easy, and so soft. Nothing puts her out of the way. And then, if you only knew how she takes your part, Caudle! I'm sure, if you'd been her own son ten times over, she could n't be fonder of you. Don't you think so, Caudle! Eh, love! Now, do answer. *How can you tell!* Nonsense, Caudle; you must have seen it. I'm sure, nothing delights the dear soul so much as when she's thinking how to please you.

"Don't you remember Thursday night, the stewed oysters when you came home! That was all dear mother's doings! 'Margaret,' says she to me, 'it's a cold night; and don't you think dear Mr. Caudle would like something nice before he goes to bed?' And that, Caudle, is how the oysters came about. Now, don't sleep, Caudle: do listen to me, for five minutes; 't is n't often I speak, goodness knows.

"And then, what a fuss she makes when you're out, if your slippers arn't put to the fire for you. *She's very good!* Yes—I know she is, Caudle. And has n't she been six months—though I promised her not to tell you—six months, working a watch-pocket for you! And with *her* eyes, dear soul—and at *her* time of life!

"And then what a cook she is! I'm sure, the dishes she'll make out of next to nothing! I try hard enough to follow her: but, I'm not ashamed to own it, Caudle, she quite beats me. Ha! the many nice little things she'd simmer up for you—and I can't do it; the children, you know it, Caudle, take so much of my time. I can't do it, love: and I often reproach myself that I can't. Now, you shan't go to sleep, Caudle; at least, not for five minutes. You must hear me.

"I've been thinking, dearest—ha! that nasty cough, love!—I've been thinking, darling, if we could only persuade dear mother to come and live with us. Now, Caudle, you can't be asleep; it's impossible—you were coughing only this minute—yes, to live with us. What a *treasure* we should have in her! Then, Caudle, you never need go to bed without something nice and hot. And you want it, Caudle. *You don't want it!* Nonsense, you do; for you're not strong, Caudle; you know you're not.

"I'm sure, the money she'd save us in house-keeping. Ha! what an eye she has for a joint! The butcher does n't walk that could deceive dear mother. And then, again, for poultry! What a finger and thumb she has for a chicken! I never could market like her: it's a gift—quite a gift.

"And then you recollect her marrow-puddings! *You don't recollect 'em!* Oh, fie! Caudle, how often have you flung her marrow-puddings in my face, wanting to know why I could n't make 'em! And I would n't pretend to do it after dear mother. I should think it presumption. Now, love, if she was only living with us—come, you're not asleep, Caudle—if she was only living with us, you could

have marrow-puddings every day. Now, don't flag yourself about and begin to swear at marrow-puddings; you know you like 'em, dear.

"What a hand, too, dear mother has for a pie-crust! But it's born with some people. What do you say? *Why was n't it born with me?* Now, Caudle, that's cruel—unfeeling of you; I would n't have uttered such a reproach to you for the whole world. People can't be born as they like.

"How often, too, have you wanted to brew at home! And I could never learn anything about brewing. But, ha! what ale dear mother makes! *You never tasted it!* No, I know that. But I recollect the ale we used to have at home: father never would drink wine after it. The best sherry was nothing like it. *You dare say not?* No, it was n't indeed, Caudle. Then, if dear mother was only with us, what money we should save in beer! And then you might always have your own nice, pure, good, wholesome ale, Caudle; and what good it would do you! For you're not strong, Caudle.

"And then dear mother's jams and preserves, love! I own it, Caudle; it has often gone to my heart that with cold meat you have n't always had a pudding. Now, if mother was with us, in the matter of fruit puddings, she'd make it summer all the year round. But I never could preserve—now mother does it, and for next to no money whatever. What nice dogs-in-a-blanket she'd make for the children! *What's dogs in a blanket?* Oh, they're delicious—as dear mother makes 'em.

"Now, you *have* tasted her Irish stew, Caudle! You remember that! Come, you're not asleep—you remember that! And how fond you are of it! And I never can have it made to please you! Now, what a relief to me it would be if dear mother was always at hand that you might have a stew when you liked. What a load it would be off my mind.

"Again, for pickles! Not at all like anybody else's pickles. Her red cabbage—why it's as crisp as biscuit! And then her walnuts—and her all sorts! Eh, Caudle! You know how you love pickles; and how we sometimes tiff about 'em! Now if dear mother was here, a word would never pass between us. And I'm sure nothing would make me happier, for—you're not asleep Caudle!—for I can't bear to quarrel, can I, love!

"The children, too, are so fond of her! And she'd be such a help to me with 'em! I'm sure, with dear mother in the house, I should n't care a fig for measles, or anything of the sort. As a nurse, she's such a treasure!

"And at her time of life, what a needlewoman! And the darning and mending for the children, it really gets quite beyond me now, Caudle. Now with mother at my hand, there would n't be a stitch wanted in the house.

"And then when you're out late, Caudle—for I know you must be out late, sometimes; I can't expect you, of course, to be always at home—why then dear mother could sit up for you, and nothing would delight the dear soul half so much.

"And so, Caudle, love, I think dear mother had better come, don't you! Eh, Caudle! Now, you're not asleep, darling; don't you think she'd better come! You say *No!* You say *No* again! *You won't have her,* you say. *You won't, that's flat!* Caudle—Cau-Cau-dle—Cau—dle—"

"Here, Mrs. Caudle," says Mr. C. in his

MS., "suddenly went into tears; and I went to sleep."—*Punch*.

NEWSPAPER REPORTS OF MURDERS.

LARGE sheets are as unfavorable to newspaper literature as large theatres have proved to dramatic art. In both cases excessive space has necessarily led to coarseness of execution.

To the excessive size of our newspapers may in no slight degree be attributed the want of artistical handling in their reports of murders. It is useless to complain of the prominence given to such topics. The public will have them. The monotony of orderly business-life begets an irresistible craving for such strong stimulants. Even those who cry out against such pandering to a vitiated taste cannot resist reading. But the same cause which has driven our newspapers to reprint parliamentary reports and foreign office protocols entire, instead of presenting their readers with a manageable analysis—the necessity of *filling up*—obliges them to enter into all the revolting minutæ of every act of butchery.

For some weeks back, Hocker and Tawell have duly occupied their couple of columns or more in the morning prints. Some other culprits preceded them in this unenviable notoriety; and the anonymous miscreant in St. Giles' promises to succeed them. It is consolatory to reflect that gross crimes must be comparatively few in number, when so much is made of those that do occur; but this scarcely compensates for the nausea occasioned by being crammed day after day by wire-drawn narratives of revolting transactions, stuffed out with maudlin and mawkish commentary.

Not the least mischievous consequence of this spinning-out system is its tendency to introduce a knowledge of the practices of low habitual depravity, where otherwise such knowledge never could have intruded. There is nothing contaminating in the contemplation of strong passion—the death-struggles of sudden passion or undying vindictiveness. But when—as in the cases of Hocker and the murderer of the unhappy woman in St. Giles'—minute details of the crime and criminal lay bare the habitual demoralization of the very outcasts of society, the mind is familiarized with images which can scarcely be entertained without affecting its purity. The female mind in Great Britain owes much to the care with which it is kept even from the knowledge of some classes of vice and vicious characters; and the male mind of Great Britain is kept comparatively pure by being constantly reminded of the necessity of respecting this ignorance. This is the characteristic of British domestic life to which the superior purity of the domestic morals of Britain is mainly owing. Its permanence will be seriously endangered, if the loathsome details of brute and squalid sensuality are to be smuggled into the family circle under the mask of a tale of murder.—*Spectator*.

From Chambers' Journal.

BOOKSELLING AFTER THE INVENTION OF PRINTING.

SOME time between the years 1430 and 1445, there lived in Mayence a rich goldsmith, whose name was John Fust or Faust, the first man who sold a printed book. His name has always been associated with that of Guttenberg and Schoeffer as one of the inventors of printing; but, as is reasonably to be inferred, erroneously; for in all the evidence with which the annals of typography supply us, he appears as the capitalist by whose pecuniary advances Guttenberg was able to bring his art into practical operation. Having vainly endeavored to produce good print in Strasburg, after expending a fortune, Guttenberg returned to his native town, Mayence, and opened his mind to Faust. The goldsmith—manifestly a shrewd man of business—saw, from the progress his fellow-citizen had made in his new method of producing books, that the thing was likely to turn out a good speculation, and warmly embarked in it. A partnership was speedily entered into, and in 1445 a printing-press was set up in Mayence, for taking impressions from the wooden blocks with which Guttenberg commenced his art. The goldsmith and his associate worked in secret, and for some time without success; till Peter Schoeffer, an illuminator of manuscripts, and a confidential person in their employ, hit upon the expedient of making movable metal types by means of punches and matrices. Faust was so delighted with Schoeffer for his ingenuity, that he not only took him into partnership, but gave him his daughter in marriage. This happened in 1452. Much patience and capital were expended even after this advance in the art made by Peter Schoeffer. The first book they tried the new system on was the Latin Bible, and before twelve sheets of it had been printed, Guttenberg and Faust had expended upwards of 4000 florins. Still they persevered, and after three years of laborious exertion, the Bible was completed.* A good number of this—the first of all first editions—having been struck off ready for the market, the next thing was to devise means for disposing of them, and it was determined that Faust should travel with copies, calling them manuscripts. "It is certain," says Lambinet, "that Faust, Schoeffer, and their partners, sold or exchanged in Germany, Italy, France, and the most celebrated universities, the books which they had printed."† This was a matter of very great difficulty and delicacy. The process by which the books were produced was a secret, which every person whom Guttenberg or Faust took into their employ was bound by oath not to divulge; to say that the bibles were produced otherwise than by the usual plan, would have partly divulged the secret, and it was for that reason that the whole of their work was executed in exact imitation of writing. The Bible was printed on parchment, the capital letters

* This Bible—the first perfect printed book which ever was issued—was a folio, in two volumes, consisting of 637 leaves, printed in large Gothic or German characters. It has no date, and is known by biblioplists as the "Mazarine Bible," a copy of it having been discovered, long after it was printed, in the library of Cardinal Mazarine, in the *Collège des Quatre Nations*. Several other copies have since turned up. It is executed with wonderful accuracy and neatness, considering it was the first specimen of the press.

† "*Recherches sur l'Origine de l'Imprimerie*"—(Researches on the Origin of Printing.)

illuminated with blue, purple, and gold, after the manner of ancient manuscripts, and they were sold as such at manuscript price—namely, sixty crowns.

About the year 1463, Faust set out on a book-selling expedition through Italy, Germany, and finally to Paris, with a stock in trade, consisting chiefly of bibles and psalters. In each place there is every reason to believe he not only busied himself in selling his bibles and psalters, but organized agencies for the sale of his wares in his own absence. Having disposed of as many of his folios as he could to the Parisians at sixty crowns, he—unwisely perhaps—reduced their price, first to forty, and then to twenty crowns. This naturally excited the apprehension and the ire of the librarians and scribes, of whom Paris was at that period the head quarters, there being no fewer than six thousand persons who subsisted by copying and illuminating manuscripts. It was not in nature that this large and important body—who held their privileges under the university—should sit tamely by and see a man selling for twenty crowns what they got from sixty to a hundred for. The rapidity with which Faust produced his pseudo-manuscripts, so as to supply the constant demands which his low charges produced on his stock, gave rise to a suspicion that he dealt with the Evil One. This suspicion was strengthened when the transcribers—who were principally monks—set about comparing the various copies of Faust's bibles. They found a degree of resemblance in each of the books—even to the minutest dot—which they concluded could only have been produced by supernatural means. The enmity of the scribes against Faust as an underselling bookseller, now threatened to become a religious persecution. The fraud once discovered, however, Faust's case was taken up by the civil power, and he was obliged to fly from Paris, to escape the officers of justice. He returned to Mayence, but found no rest there; wherever he had sold his books, he had of course practised deception, and the agents of justice were equally clamorous for him in his native town. He withdrew to Strasburg.

In the mean while, Mayence was taken by storm by Adolphus of Nassau. By this event Faust and Schoeffer's journeymen were dispersed, and deeming themselves absolved from their oath of secrecy, they carried the invention into various parts of Europe, many of them setting up presses of their own. Then, and not till then, Faust made a merit of necessity, and wrote and circulated a work in which he described the whole process by which his books were executed. That there should be no further doubt or ambiguity as to whether the productions of himself and partners were manuscripts or print, he placed at the end of his little book the following colophon or inscription:—"This present work, with all its embellishments, was done, not with the pen and ink, but by a newly invented art of casting letters, printing, &c., by me, John Faust, and my son-in-law, Peter Schoeffer, in the famous city of Mentz upon the Rhine." In this, as in every other instance, honesty proved to be the best policy; for now that Faust had cleared up the mystery, he was no longer pursued as an impostor; and ultimately we find him in 1466 in Paris, making arrangements for establishing a permanent agency for the sale of the productions of his own and his son-in-law's press. This, as we shall presently see, he effected. In the midst of his labor, how-

ever, death overtook him. In that year the plague raged in the French capital, and John Faust fell a victim to it, far away from his home and his friends.

Such is a bare outline of the career of one of the parents of printing, and the sole father of modern bookselling. John Faust (otherwise John *Haad*) was the very reverse of such a necromancer and personal friend of the Evil One as tradition and error have succeeded in picturing him. The truth is, he is often confounded with Jean-Frederic Faust, a charlatan and almanac-maker, who lived about a century after the goldsmith's death, and upon whose history Goethe, the German poet, constructed his celebrated play. Nothing could be more opposite than the characters of the two men: the one a plodding, yet withal liberal and far-sighted tradesman; the other a quack, but one, we may mention, not quite unconnected with the mysteries of the book-trade. To insure his almanacs a large sale, he advertised them as having been annually dictated to him by Beelzebub. The confounding of the two men took its rise most likely from the cunning of the monks, after the Reformation; of which, there is no question, the diffusion of the Bible, by means of the press, was the primary cause. They therefore owed John Faust no good-will for the part he unwittingly took in destroying their system, and tried to defame his memory by mixing up his life with that of a mountebank.

The venerable goldsmith, printer and bookseller, did not depart this life till he had placed the Paris agency on a secure footing. The name of the agent he employed was Herman de Statten, and the agency was carried on at the house of one John Guymier, as we learn from a curious document found in a copy of Faust and Schoeffer's edition of the Latin Bible. It is a deed of sale of the book to Tourneville, Bishop of Angiers, and runs thus;—"I, Herman, a German, workman of the honest and discreet John Guymier, sworn bookseller of the university of Paris, acknowledge to have sold to the illustrious and learned master William, of Tourneville, archbishop and canon of Angiers, my most respectable lord and master, a Bible printed at Mentz (Mayence) upon vellum, in two volumes, for the price and sum of forty crowns, which I have absolutely received, which also I ratify by these presents, promising to abide by the same, and guaranteeing my lord, purchaser of the said Bible, against any one who would dispossess him. In ratification of which I have hereunto affixed my seal, this fifth day of the month of April, in the year of our Lord M.CCCCLXX. Herman."* By this we perceive that since they first came into Paris, the printed bibles were elevated in price.

It happened, unfortunately, that Herman of Statten failed to obtain any legal instrument of naturalization in France; and when he died—which he did a few years after his master, Faust—his effects were confiscated as the property of a foreigner. The books intrusted to him by Schoeffer, and amounting in value to 1100 francs, were included in the confiscation. Schoeffer, however, obtained restitution through the liberality of Louis XI. It is a striking illustration of the value and scarcity of money at that period, that the King of France found it inconvenient to pay the sum—equal only to £45, 6s. 8d.—at once; but did so in two yearly instalments!

*Dr. Dibdin's *Bibliotheca Spenceria*, vol. i., page 16, note.

The distribution of Faust, Schoeffer, and Company's workmen at the siege of Mayence in 1462, began by this time (1470) to operate throughout Europe, by supplying printers to various continental cities. At this early time most printers sold their own books; and if we state the different periods at which printing was introduced into various countries, we shall show also when books of print began to be sold in each place. The first introduction of this invention into Italy was at Subbiaco, in 1465; into Paris, in 1469; into England, (Westminster,) in 1474; into Spain, (Barcelona,) in 1475; into Abyssinia, in 1521; into Mexico in 1550; into the East Indies, (Goa,) in 1577; into Peru, (Ilima,) in 1586; into North America, (Cambridge, Boston and Philadelphia,) in 1640. One of the most active of the German printers and booksellers, between 1473 and 1513, was Ant. Kober, at Nuremberg, who had 24 presses and nearly 100 workmen in his employ, and kept open shops at Frankfort, Leipsic, Amsterdam, and Venice, all conducted with the greatest regularity and order. He had on sale not only works of his own publication, but also works of other publishers. At Ulm and Basle there were likewise several booksellers carrying on an extensive trade. The many pilgrimages (Wallfahrten) to holy places in the interior of Germany—which were then as much frequented as the sacred shrines in India, and are so still in some Roman Catholic countries—offered them good opportunities for disposing of their books, particularly of those having a religious tendency, which were printed on cheap linen paper, instead of the expensive parchment formerly in use.

Wherever we turn, we shall find that, once introduced into a country, the press was kept in extraordinary activity, and books were spread in all directions. There were in England, from the time of Caxton to 1600, no fewer than three hundred and fifty printers. Ames and Herbert have recorded the titles of ten thousand different works printed here in the same interval; the yearly average number of distinct works issued and sold in the hundred and thirty years was seventy-five. The number of copies of each was, however, in all probability small, for the early booksellers were cautious. Even Grafton only printed 500 copies of his complete edition of the Scriptures (that of 1504;) and yet so great was the demand for the English Bible, that there are still extant copies of 326 editions of it which were printed between 1526 and 1600.

In Italy the works of the old classic Roman authors were rapidly printed, when means for doing so were introduced. In Switzerland, especially at Geneva and Basle, a great number of books, chiefly of a religious character, were printed and sold immediately after presses were set up. Indeed, the trading talent of the Swiss manifested itself in the beginning of the sixteenth century very prominently in relation to books, for they supplied booksellers even to Germany—to which we must now return.

In the dawn of literary commerce, wholesale trade, in whatever article, was chiefly conducted at fairs, which took place once, twice, or thrice a-year. To these great meetings manufacturers and agriculturists brought such produce as was of a perishable character, and which was purchased by retailers, who either came from different parts of the country, or employed local agents to purchase on their account. Amongst other

manufacturers, the printers brought their goods, which were bought by retailers, and distributed by them throughout the country. At first the greatest quantity of booksellers' stalls was assembled at the Frankfort fairs, where multitudes of strangers and merchants met. Ant. Kober of Nuremberg, Ch. Plantin of Antwerp, and Stephanus (Etienne) of Paris, are recorded as booksellers visiting the Frankfort fair as early as the year 1473. From this period Frankfort gradually became the great book-mart. In 1526 Christopher Froschauer, from Basle, wrote to his principal, Ulrich Zwingli, informing him of the rapid and profitable sale of his books at Frankfort, to persons who had sent for them from all parts. In 1549 Operin of Basle, publisher of the classics, visited Frankfort, and made a profitable speculation. At this period appeared Luther, the great champion of the Protestant world, protesting loudly and openly, both in speech and in writing, against the many abuses that had crept into the church of Rome; and the great cause of the Reformation, while it derived great assistance from the printing-press, repaid this benefit by contributing largely to its development and extension. Saxony, with its enlightened universities, (Wittenberg and Leipsic,) now became the seat and central point of free theological discussion and investigation, and the booksellers soon found it worth their while to visit also the Leipsic fair. Besides, the literary intercourse in that country was free and unfettered, whilst at Frankfort it had to contend, in later years, with several difficulties, arising from the peculiar situation of a smaller state, and the restrictions and vexations of an imperial Board of Control (Kaiserliche Bücher Commission) established by the German emperor, through the influence of the Catholic clergy. Archbishop Berthold, of Mayence, had previously (in 1486) established a similar censorship in his dominions. The chief object of that board was to watch and visit the book-shops—which, in Frankfort, were all situated in one street, still called the Buchgasse—seizing forbidden books, claiming the seven privilege copies ordered by law to be presented to the universities, and, in fact, exercising the power of a most troublesome police. Against this the booksellers often remonstrated, but without success.* At length the principal part of the book-trade withdrew to Leipsic, where general fairs were held thrice every year, and where, next to Frankfort, the greatest number of books was sold.

The earliest accurate information obtained respecting the sale of books at Leipsic fair refers to 1545, when we find the printers Steiger and Boskopf, both of Nuremberg, repairing thither with their "wares." A few years later, the fame of this market as a place of sale for books spread over the rest of the continent, and in 1556 it was visited by the Paris bookseller Clement, and in 1560 by Pietro Valgrisi from Venice. From the accidental mention of these visits and names in the annals of the Leipsic fair, we may infer that booksellers from other parts of the world also frequented it habitually, although no record of their presence has been made. The different languages which they spoke had little effect upon the sale of their books, the greater part of which, wherever printed, was in Latin. In 1589, the

number of *new works* brought to Leipsic was 363, of which 246, or 68 per cent., were in the Latin language. The literary tastes of that time may be guessed from the fact, that of the whole number of these literary novelties, 200 were on theological subjects, 48 on law and jurisprudence, and 45 on philosophy and philology.

The trade in books carried on in Leipsic increased so rapidly, that it banished traffic in other articles from the fair. No fewer than fourteen printers and booksellers had, by 1616, taken up their residence in the city. The names of these individuals have become dear to the modern bibliomaniac, from the rarity of the works, bearing their respective imprints.* These "publishers" (for by this period the wholesale bookseller was distinguished from the retailer by that expression) brought to the Easter fair of 1616 no less than 153 new works, the productions of their own presses. Of other publishers in various parts of Germany, eight resided at Frankfort-on-the-Maine, seven belonged to Nuremberg, four to Jena, three to Ulm, and the same number to Hamburg; Wittenberg, Strasburg,† Gotha, Colonge, Breslau, had each two, and Lübeck, Goslar, Heidelberg, Rostock, and Luneburg, one.

The Easter fair held at Leipsic was now exclusively devoted to books. The booksellers had already organized a system, by which they were enabled to print a catalogue of every new work that was to be sold at the fair, so that purchasers had no difficulty in making their selection; and Leipsic Easter fair became the great book-mart for the whole continent.

Having brought our notices of "the trade" in Germany down to the great era in its existence, the establishment of the Leipsic book-fair, and in England to the unhappy time when our country was torn by civil war, and the book, with all other trades was in a struggling and depressed condition, we shall, in succeeding articles, offer some interesting facts concerning the modern system of book-selling, as practised in various countries where any very considerable literary commerce is carried on.

EDMUND BURKE AND CHARLES TOWNSHEND.—Ready as Burke's wit was, it appeared artificial when set by that of Charles Townshend, which was so abundant, that in him it seemed a loss of time to think. He had but to speak, and all he said was new, natural and yet uncommon. If Burke replied extempore, his very answers, that sprang from what had been said by others, were so painted and artfully arranged, that they wore the appearance of study and preparation: like beautiful translations, they seemed to want the soul of the original author. Townshend's speeches, like the satires of Pope, had a thousand times more sense and meaning than the majestic blank verse of Pitt; and yet, the latter, like Milton, stalked with a conscious dignity of preëminence, and fascinated his audience with that respect which always attends the pompous but often hollow idea of the sublime.—*Walpole's George III.*

* The chief amongst them were James Apel, Joh. Boerner, Elias Rehfeld, Joh. Eyering, Christ. Ellinger, Henning Grosse and his father, Abr. Lamberg, Caspar Kloseman, Bartholomew Voigt, and John Perfect.

† Strasburg and Alsace belonged at that time to Germany.

From Punch.

THE POSITION OF THE PREMIER.

THE position of Peel between the Maynooth and Anti-Maynooth parties—the former applauding him on the one hand, while the latter are condemning him on the other—may be compared to the situation of the heroes in the Greek tragedies, whose proceedings were the subject of alternate abuse and praise from the chorus; the right of a chorus to criticise is founded on the old constitutional doctrine that the people may give their opinion, and there can be no doubt that this mode of giving votes in a song has some affinity to the vote by ballot, or vote by ballad, as some have been in the habit of calling it. The Maynooth and Anti-Maynooth expressions of opinion may be likened to the strophe and anti-strophe of the chorus, of which we furnish a specimen.

MAYNOOTH STROPHE.

Go on, great premier, in thy way,
No matter what the Tories say;
It surely can be no disgrace
For you to try and keep your place.
They say that, by the Maynooth Grant,
To keep your place is all you want;
It is a wise and cunning plan—
The premier is a wondrous man!

ANTI-MAYNOOTH ANTI-STROPHE.

How wonderful is Peel!
He changes with the time;
Turning and twisting like the eel,
Ascending through the slime.
He gives whate'er they want
To those who ask with zeal,
He yields the Maynooth Grant
To the clamor for repeal.

MAYNOOTH STROPHE.

'T is true he is a rat,
But what of that?
Tory he used to be,
But now a Liberal he!

Shall we for soaring high
The altered premier snub?
Who in the butterfly
Would recollect the grub?
Cheer him as up he springs,
Borne on his new-found wings;
He holds complete dominion.
Supported by o-pinion.
Then let us sing with zeal,
Success to Premier Peel.

ANTI-MAYNOOTH ANTI-STROPHE.

He has baffled our every hope:
He's surely in league with the pope!
We thought him the friend of the church,
He is leaving her now in the lurch.
I'll bet that he shortly obtains
A cardinal's hat for his pains.
To punishment let us denounce him;
Will nobody venture to trounce him!

[The two parties approach each other, singing their respective choruses, one against the other, and the curtain falls.]

A NATIONAL MELODY.

Air—" *Lesbia hath a beaming eye.*"

INGLIS is a tory high,
But no one cares for what he seemeth;
Right and left his speeches fly,
But what they aim at no one dreameth.
Better 't is to look upon
The tory premier when he rises;
Few his plans, but every one
By some new light the house surprises.
Oh, my tory premier dear,
My artful dodging tory premier;
Many glide
From side to side,
But you're on both, my tory premier.

Ingles wears his coat of old,
But prejudice so tight has lac'd it,

That each idea of tory mould
 Must stay where obstinacy plac'd it.
 Oh, my premier's coat for me,
 Mov'd by agitation's breezes,
 Leaving every action free
 To twist and turn where'er he pleases.
 Yes, my tory premier dear,
 My artful dodging tory premier;
 Nature's views
 Have different hues,
 And so have yours, my tory premier.

Inglis has a speech refin'd,
 But when its sounds are o'er us creeping,
 Who can tell if it's designed
 To wake us up, or set us sleeping?
 Mesmerized by Robert's art,
 Poor Britannia drowsy waxes,
 Eyes sealed up—the horrid part—
 Is but the paying of the taxes.
 Oh, my tory premier dear,
 My cool, my crafty tory premier;
 Whigs, who'd learn
 The time to turn,
 Should ask of you, my tory premier.

PUNCH FOR HEAD PACIFICATOR.

DURING centuries Ireland, to speak metaphorically, has been in a perpetual broil; though perhaps we might more happily compare the state of things Irish to a stew. Peel confessed that Ireland was his chief difficulty; and he might also have confessed that he did not know what to do with her. It is quite clear that he does not understand her case. He began by antiphlogistic treatment—to wit, the state prosecutions—and now he is trying the Maynooth Soothing Syrup, which some call Bobby's Elixir. This is mere empiricism; no better than what might be expected from Holloway or Old Parr. Let the premier practise on principle, if he knows what that is. But in fact, the case of Ireland would puzzle any statesman but *Punch*, who, amongst many other notions, has one for her pacification, which he hereby offers to the conservatives and all others whom it may concern, if they will have it. His suggestion is as follows:—

He would advise them to get up a Joint Stock Company, for the purpose of negotiating with Mr. Daniel O'Connell, a sale of the whole Irish people. As the repeal agitation cannot last forever, and as it may be difficult to get up any other humbug, a good round sum in the lump may prove an adequate temptation. Instead, therefore, of voting money to Maynooth, vote a "consideration" to Daniel O'Connell. So sure will this plan for the tranquillization of Ireland be to answer, that *Punch* considers that by merely proposing it, he has cut Tom Steele out, and will therefore trouble that gentleman to return to him the title of "Head Pacificator of Ireland."

A NEW CABINET LIBRARY.

MINISTERS intend shortly, we understand, issuing a series of volumes on various subjects, for the purpose of enlightening the people, to be called the New Cabinet Library. The work will be written chiefly by the ministers themselves, so that there will be great variety in the style, and in the mode of treating the various topics handled.

The following will be a few of the volumes that will shortly appear:—

1. The Curiosities of Literature, chiefly selected from intercepted correspondence. By Sir James Graham.
2. How to live on Fourteen Thousand a year. By the Lord Chancellor.
3. Three Experiments of Living; or, Three Livings at Once, by way of Experiment. By the Bishop of Exeter.
4. The Outcast; The Exile's Return; and other Poems. By Lord Ellenborough.
5. Natural Magic, including several new tricks; with an Essay on Gammon and Backgammon. By Sir R. Peel.
6. Miscellaneous Essays. By Lord Brougham.
7. The Pauper's Cookery Book; including ten thousand economical recipes, amongst which will be found five hundred different modes of dressing oatmeal, and a plan for roasting a fowl before the fire, in such a way as to make chicken-broth of the shadow. By the Poor Law Commissioners.
8. Confessions of an English Opium Eater. By One who has swallowed all the dull speeches that have been spoken in the House of Commons for the last ten years.

Too BAD.—The following announcement has appeared in various papers:—"The Rev. W. Dealtry, D. D., Chancellor of the Diocese. Canon of the Cathedral Church of Winchester, Prebendary of Southwell, and Rector of the parish of Clapham, Surry, has been appointed, by the Lord Bishop of Winchester, to the Archdeaconry of Surrey, void by the elevation of the venerable Samuel Wilberforce to the deanery of Westminster."

Poor Dr. Dealtry! We feel for him deeply. How will he ever get through the work which he will now have to do? He was already laden with four several offices in the church, and saddled with the obligation of being in three different places at once. He had to pray, preach, exhort, console, convert, and go about visiting the sick and doing good at Winchester, Southwell, and Clapham; besides all which, he had his chancellor's business to attend to. And now, in addition, an archdeaconry is clapped upon his shoulders.

Really, this is working a willing horse to death. There is not, we are persuaded, a negro in all Kentucky fagged to the extent that Dr. Dealtry will be. What has the poor clergyman done to deserve such treatment? How, we would wish to know, would the Bishop of Winchester like it himself? It is much more like a Turk than a bishop to make a fellow-creature toil in this way. We say it is a great deal too bad of his lordship, and recommend him to be more considerate in future. We shall be told that Dr. Dealtry will be well paid for his labor. Yes; but what has that to do with the matter? What pay can compensate a man for exertions which must necessarily kill him!

LITERARY PEERS.—It is, we believe, in contemplation by the English government to follow the example of France, and raise a few writers to the peerage. The following will, we are told, be among the earliest elevations:—

Mr. W. H. Ainsworth, to be *Baron of Bluestin*.
 Mr. Benjamin D'Israeli, to be *Marquis of Coningsby*.
 Mr. James Grant, to be *Earl of Cornhill, in the Great Metropolis, and Baron of Hey-down-hey-down-derry, in Ireland*. Other titles will, it is expected, be soon conferred, but the above are all at present decided on.

From Fraser's Magazine.

THE WOLVES OF ESTHONIA.

There is a kind of savage luxury, however gorgeous and costly, which perfectly assimilates with savage life, and where the eye may pass at one glance, from the pampered inmate of the palace to the wild beast in the woods, without any sense of inconsistency to the mind. This may be remarked, more or less, with all Oriental nations. The Indian prince is in keeping with the tiger in his jungle, the Russian noble with the bear in his forests. But it is a different and very strange sensation to find yourself in a country where inward and outward life are at variance; where the social habits of the one by no means prepare you for the rude elements of the other; where nature is wild, and man tame. This is conspicuously the case in the northwestern part of Russia, where a German colony, although lords of the soil for hundreds of years, are still as foreign to it as they were at first; having originally brought a weak offset of civilized life into a country for which only the lineal descendants of the savage were fitted, and having since then rather vegetated upon the gradually impoverishing elements they transplanted with them than taken root in the gradually improving soil around them. Life, therefore, in this part of the world passes with a monotony and security which remind you of what, in point of fact, it really is, viz., a remote and provincial state of German society of the present day. Both the inclinations and occupations of the colonists confine them to a narrow range of activity and idea. The country is too wild, the population too scattered, the distances too great, the impediments, both of soil and season, too many for them to become acquainted with the secrets of the wild nature around them; or rather, not without a trouble which no one is sufficiently interested to overcome. They travel much, from place to place, upon roads bad enough, it is true, but always beaten; they have no pursuit but mere business or mere pleasure, and no interest except in what promotes the one or the other; and, in short, know as little of what goes on in the huts of the native peasantry, or in the forest and morass haunts of the native animals, as if they were strangers in the land, instead of its proprietors. It is, therefore, as we before remarked, a strange and most unpleasant feeling, while spending your days in a state of society which partakes of the security and ease of the present day, to be suddenly reminded by some accidental circumstance of a state of nature which recalls the danger and adventure of centuries back.

It was early in the spring, after a long and very severe winter, when the earth was just sufficiently softened to admit its stock of summer flowers, though not sufficiently warmed to vivify them, that the garden belonging to a country-house situated in this part of Russia had become the scene of great activity. Hundreds of leafless plants and shrubs, which had passed their winter in the darkness and warmth of the house-cellar, were now brought out to resume their short summer station, and lay strewed about in various groups, roughly showing the shape of the bed or border they were to occupy. The balmy air had also summoned forth the lovely mistress of the mansion, a delicate flower, more unsuited to this wintry land even than those which lay around her, who went from one plant to another, recognizing in the leafless

twigs the beautiful flowers which had been, or were to be, and shifting and reshifting their places on the fresh bare earth till they assumed that position which her taste or fancy approved—just as a fine London or Paris lady may be seen in a jeweller's shop shifting her loose diamonds upon a ground of purple velvet into the order in which they are to be finally set. A younger lady was with her—a cousin by birth and a companion by choice—one of those "friends who sticketh closer than a brother," and who had recently joined her, after a long separation, in a home foreign to each. Her two children were there also, beautiful and happy creatures; the elder one glad to be of use, the younger one delighted to think herself so; while Lion, an enormous dog, the living image, in size, color, and gentleness, of Vandyk's splendid mastiff in his picture of the children of Charles I., lazily followed their steps, putting up his huge head whenever a child stooped hers, and laying himself invariably down exactly where a flower was to be planted.

After spending some time in this occupation, and having at length marked out the summer garden to their satisfaction, the party turned their steps towards the house, where some beds, close under the windows, had been planted the preceding evening.

"Lion, Lion!" exclaimed the eldest child, "you should know better than to come across the fresh-raked beds," showing us a track of large, clumsy footmarks, which had gone directly over it. "Yes, look at the mischief you have done, old dog, and be ashamed of yourself; but keep off now! keep off!" for Lion was pressing forward with all his weight, snuffing at the prints with quick-moving nostrils. The lady stooped eagerly over the animal.

"These are no dog's footprints," she said; and then, pointing to more distant traces further on, "No, no. Oh, this is horrible! And so fresh, too. A *wolf* has been here!"

She was right; the footmarks were very different from a dog's—larger and coarser even than the largest dog's, longer in shape, and with a deeper indentation of the ball of the foot. It was truly a painful and a fearful feeling to look at that bed, on which the hand of man had been so recently employed, now tracked over by the feet of one of the most savage animals that exist; and the lady drew back shuddering. And Louisa, for that was the cousin's name, shuddered too, if not with so real a sense of fear, yet with a much more unlimited impression of terror. She was a stranger as much to the idea as to the sight, and, as she looked up at the window just above—her own bedroom window—with its peaceful white curtains and swallow's nest at the corner, and remembered that she had been sleeping within while the wild-beast was trampling beneath, she felt as if she should never rest easily there again. As for the children, they both looked terrified at first, chiefly because their elders did, and then each acted according to the character within her—Olga, the elder, holding quietly by her mother's hand, and afraid even to look at the footprints, though approaching them docilely when she was bidden; while little Miss Constance, unscrewing her rosy face from its momentary alarm, trotted with great glee over the fresh-raked bed, delighted to make the most of a privilege usually forbidden her, and discovered new wolf's steps in all directions as fast as Lion made them.

They now called some of the workmen, who instantly confirmed their verdict.

"This is an old wolf, *Prauer*," said a rough, long-haired shrewd-looking old peasant, scrutinizing the tracks with Indian-like closeness and sagacity—"this is an old wolf, he walked so heavily; and here's a wound he has got to this paw, who knows when, from some other wolf, or maybe from Lion—I dare say they are acquainted," pointing out to the party a slight irregularity in the print of one of the hind feet, as if from a distorted claw. "He was here the beginning of the morning, that I can see."

"But where was Lion?" said the lady, eagerly. "I went to the mill, *Prauer*, at sunrise, and took Lion with me, and by the time we got back the beast must have been off. I saw the old dog snuffing about, but the heavy dew would stop any scent. The wolves are hungry now; the waters have driven them up together, and the cattle are not let out yet. He is not far off, either; we must keep a sharp look-out. An old wolf like this will prowl about for days together round the same place till he picks up something."

"Heavens! how dreadful! Constance, come back this moment," said the young mother, with an expression of anxiety which would have touched the roughest heart. "Who knows where the creature may be now?"

"Never fear, *Prauer*; he's off to the woods by this time—plenty of his footmarks to be found there, I warrant," pointing to a low, dismal-looking tract of brushwood, which formed the frontier to an immense morass, about a werst off. "Never fear, old Pertel and old Lion will take care of the little *Preins*. *Polle üchtige*! nothing at all, not a hair on their heads, shall be hurt, bless them!"

"Yes, yes, good Pertel," said the lady, with a nod and a smile, to the rough creature, "I know that. But under our very windows!—I never knew them come so near before."

"*Dreist wie ein wolf*—bold as a wolf," said the phlegmatic head-gardener, a German; "that's an old proverb."

They now returned to the house with minds ready to take alarm at any sight or sound. The cousin knew not how much there was or was not to fear; and, though the lady did, the voice of her maternal anxiety amply made up for all the silence of her imagination. The children, of course, were not slow in catching the infection; and, what with fear and what with fun, there was no end to the wolves that were seen in the course of the next four-and-twenty hours. Any and every object served their turn: sheep, foals, and calves; old men and old women; stunted trees in the distance, and round grey stones near; not to mention innumerable articles of furniture in various corners of the house, all stood for wolves; not only successively, but over and over again. Lion, however, was the greatest bugbear of all, and the good old dog could not push open the door, and come lazily in, with all his claws rattling on the smooth *parquette* floor, without setting the children screaming, and startling the two ladies much more than they liked to confess.

But this state of things was too inconvenient to last. A succession of false alarms is the surest cure for false fears; and, to quote the fable for once in its literal sense, they were weary of hearing "Wolf!" called. Nevertheless, they did not undertake long walks without protection, and

never at all in the direction of the morass; the children were not allowed to wander a step alone; doors and windows, which otherwise, at this time of the year, are very much left to please themselves by night as well as by day, were now every evening punctiliously closed; and one door especially, next Louisa's bedroom, at the end of a long corridor which communicated with an unfinished addition to the house then in progress, was always eyed with great distrust. It had no means of shutting whatsoever. Nightly a bar was talked of, and daily forgotten; but "*Dreist wie ein wolf!*" sounded in Louisa's ears, and she pushed a heavy box firmly against it.

Several days passed away, and the episode of the wolf's footprints was almost forgotten, when suddenly a scream and a shout were heard from a kind of baking-house within view of the windows. Lion started up from the cool drawing-room floor, where he lay stretched at full length, and leaped out of the open window. Workmen from the new building rushed across the lawn, each with such implements in their hands as they had been working with; and out of the baking-house, followed by a lad, sprung an immense wolf. At first, he bounded heavily away, and was evidently making for the wood; but Lion came close upon him, overtook him in a few seconds, and attacked him with fury. The wolf turned, and a struggle began. For awhile the brave dog was alone: each alternately seemed to hang with deadly gripe upon the other, and yells, and snorts, and sharp howls, filled the air. But now the foremost of the pursuers reached the spot; dog and wolf were so rolled together, that at first he stayed his blows; but soon a terrible stroke with the hatchet was given—another, and another. The animal relinquished the dog, tried to turn upon the man, and soon lay dead at his feet.

Meanwhile, the ladies from the mansion were also hurrying forward, full of horror for the scene, and of anxiety for Lion, but unable, in the excitement of the moment, to keep back. There lay the animal, the ground ploughed up violently around it, a monstrous and terrific sight. Death had caught it in the most savage posture—the claws all extended—the hind feet drawn up, the fore ones stretched forward—the head turned sharp round, and the enormous jaws, which seemed as if they would split the skull asunder, wide open. Nature could hardly show a more repulsive-looking creature—one which breathed more of the ferocity of the wild beast, or excited less of the humanity of man; and, as Louisa looked down at the lifeless carcass, all lean, starved, and time-worn, with ghastly gashes, where late every nerve had been strained in defence of that life which God had given it, entangling doubts came over her mind of the justice of that Power which could make an animal to be hated for that which His Will alone had appointed it to be. But, fortunately for her, she came from a land where, with all its faults, the stone of sophistry is not given for the bread of faith; quickly, therefore, came that antidote thought, which all who seek will find—the sole key to all we understand not in the moral world—leaving only a pardonable pity for a creature born to hunt and be hunted, ordained neither to give nor to find quarter, and to whom life had apparently been as hard as death had been cruel. Poor beast! It was a savage wolf all over; rough, coarse, clumsy, and strong; the hair, or rather bristles, dusky, wiry, and thin; and not one

beauty about it, except, perhaps, those long, white, sharp teeth, which had drawn so much blood, and were now tinged with that of the fine old dog. Lion lay panting beside his dead enemy, the blood trickling down his throat, on which the wolf had fixed a gripe which life could not long have sustained.

The whole history was now heard from the lad. There had been baking that morning in the out-house, and he went in to light his pipe. As he blew up the ashes, he saw a great animal close beside him. In the dark, he mistook it for Lion, and put out his hand; but it rose at once against him with an action not to be mistaken by a native of these climes, on which he screamed as loud as he could, for his breath stood still, the poor boy assured them, with fright; and the creature, taking alarm, rushed out of the door.

"The *Præter* may let the little ladies run about now," said old Pertel. "That's the same wolf that crossed the bed last Thursday; I know him by this left hind foot;" and he held up a grim limb where an old wound had turned the claw aside. "He got this in some of his battles; many a foal yet unborn would have felt it this summer." And the old man stroked the dead animal with satisfaction.

They now all left the scene of battle, and refreshments were given to those who had assisted at it. Olga proposed giving the boy, who was still all trembling with fright, a glass of sugar and water, this being what the ladies of this country invariably take when their nerves are shaken; but her mother suggested that a glass of brandy would be much more to his taste; and accordingly he received a dose, which not only restored the courage he had lost, but lent him a large temporary stock in addition. Lion, too, was well cared for, and immensely pitied. The wound on his throat, which was too close under his own long tongue to be reached by it, was washed with certain balsams with which this country abounds; after which, the old dog employed himself in slobbering over various rents and scratches in more accessible parts of his body, and finally went fast asleep, which the children hoped would do him much good, and, for about two minutes, spoke over him in whispers, and went round him on tiptoe.

Since the day of the footprints, the lady and her cousin had carefully refrained from any subject connected with wolves, or wild beasts in general; for the children's imaginations required to be studiously tranquillized, and even their own were quite lively enough without additional stimulus. But now nothing else was discussed; everything was *à propos* of wolves; and some acquaintances from a distant part of the country, coming in for the evening, the whole time was passed in telling wolf anecdotes.

The fact of the animal being discovered in the baking-house was soon explained; for it appeared that the wolf, like the bear, is excessively fond of bread, and that after the smell of fresh blood, that of fresh baking is surest to attract him. A peasant woman, who had drawn her hot rye loaves out of the oven, quitted her cottage for a few minutes, leaving her two young children playing at the same bench on which the smoking bread was laid. Scarcely had she turned her back, when an enormous wolf sprang in, took no notice of the screaming children, but snatched a loaf from the bench. The mother, hearing screams, hastened back, and as she reached the door the wolf bounded out of it

with the hot bread in his jaws. "I have heard the old woman often tell the tale," said the speaker; "and she invariably added, 'And so I lost my biggest loaf, but never was there a guest more welcome to it.'"

Another time, a kitchen-maid, whose office it is to bake the common rye bread, was carrying the hot loaves, towards night, across the court, when she met a large animal whom she mistook in the dark for one of the huge cattle-dogs. But it rose upon her, and she felt the claws upon her bare arm, ready, at the next moment, to slit the skin, as is their wont, and rend her down. In her terror, she crammed a loaf into the creature's jaws, and he made off with the sop, perfectly content.

Upon the whole, it is very difficult to procure information about the wolf's habits, or even tidings of its depredations. The common peasant, who alone knows anything about the animal, is withheld by superstition from even mentioning the name of *wolf*; and, if he mentions him at all, designates him only as the "old one," or the "grey one," or the "great dog," feeling, as was also the case in parts of Great Britain with regard to the fairies, that to call these animals by their true name is a sure way to exasperate them. This caution may be chiefly attributed, however, to the popular and very ancient belief in the "*vår wolf*;"* not a straightforward, open-mouthed, plain spoken beast, against which the cattle may plunge, and fight, and defend themselves as best they may, and which either wounds or kills its prey in a fair and ferocious way; but that odious combination of human weakness and decrepitude, with demoniacal power and will, which all nations who have believed in have most unjustly persecuted and most naturally hated—in other words, a bad, miserable old woman leagued body and soul with Satan, who, under the form of a *vår wolf*, paralyzes the cattle with her eye, and from whom the slightest wound is death. Be this as it may, the superior intelligence of the upper classes is to this day occasionally puzzled to account for the fate of a fine young ox, who will be found in the morning breathing hard, his hide bathed in foam, and with every sign of fright and exhaustion, while, perhaps, only one trifling wound will be discovered on the whole body, which swells and inflames as if poison had been infused, the animal generally dying before night. Nor does the mystery end here; for, on examining the body, the intestines will be found to be torn as with the claws of a wolf, and the whole animal in a state of inflammation, which sufficiently accounts for death.

This same superstition also favors the increase of this dreadful animal, for the peasant has a strong feeling against destroying a wolf; says that, if you disturb them, they will disturb you, and generally attributes the loss of his foal, or of foal and mother together, (a too frequent occurrence,) to the plunder of a wolf's nest by his less superstitious neighbor. Nevertheless, the destruction of their young is the only way in which an efficient warfare with the wolf can be carried on, and the

* "This mysterious and widely spread superstition—the *vår wolf* of England, the *loup garron* of France—was especially current in Germany, where many tales of its terror still exist. Two warlocks were executed in the year 1810, at Liege, for having, under the form of *vår wolves*, killed several children. They had a boy of twelve years of age with them, who completed the Satanic trio, and, under the form of a raven, consumed those portions of the prey which the warlocks left."—Grimm's *Deutsche Sagen*.

provincial government of this part of Russia wisely bestows a small reward in money for every pair of wolf's ears that is brought to the magistrate of the district; thus setting up one powerful passion in the human breast against another. But superstition has the best of it at present, and, perhaps, in the long run, is the better thing of the two.

The wolves make their nests usually deep in the morasses, a few sticks being dragged together in a small hollow, or under a juniper-bush, where the young wolves lie with great jaws, which open wide at the slightest noise, like the bill of a young bird, and equally disproportionate to their size. It is at this season that the wolves are the most rapacious and dauntless, defying danger, and facing daylight to provide prey for their young. In old times, if tradition is to be believed, the abduction of peasant children for the young wolves was a thing of no uncommon occurrence, so that the father of a former day had as little chance of rearing all his children as the farmer of the present his foals. But now, with the culture of the land, and the gradual increase of farming stock, a favorable change has taken place, and the recent introduction of sheep especially has proved a great accommodation to both parties. Nevertheless, the wail of a poor peasant mother for a missing child is still raised from time to time, though the widely scattered population, and the remote situation of single villages, on that account more exposed to such depredations, allow only the occasional echo of such distress to reach the ears of the upper classes. The peasant also is an uncommunicative being; the slave of one set of foreigners, the subject of another, and oppressed by both, he shuts up his mouth and his heart, and cares little to divulge the more sacred sorrows of his life to those who are the authors of almost every other.

The evening visitors, however, related a wonderful instance which had occurred under their own knowledge:—A peasant child, just able to trot alone, and as such left to trot just where it pleased, was carried off unperceived and unhurt by a she-wolf to her nest at some distance. The young wolves, however, had just consumed some larger and commoner prey, and knew when they had had enough; so they let the child lie among them, and saved it up for another day. The little creature remained thus through the night, when the old one quitting the nest again, and the young ones probably sleeping, it crawled gradually away, as unintentional of escape as it had been unconscious of danger, and at length reached the fence of a remote field, where it was picked up by a laborer, and brought to the house of the narrator. But the innocent child had suffered terribly, and bore upon its tender body such marks of the wolf's den as would, so long as it lived, sufficiently attest an otherwise almost incredible fact. The young wolves had forborne to devour their prey, but they had *tasted* it! the skin of the forehead was licked raw, all the fingers were more or less injured, but two of them were sucked and mumbled completely off!

This tale was now followed by another more tragic and equally true, having taken place only the summer before upon a neighboring estate, so that the lady of the house, her beautiful brow contracted, and her voice lowered, related it herself to the party. A woman, whose husband, being a bailiff or something of the kind, lived in a more comfortable way than the usual run of peasants,

though still classing as a peasant, was washing one day before the door of her house, with her only child, a little girl of four years old, playing about close by. Her cottage stood in a lonely part of the estate, forming almost an island in the midst of low, boggy ground. She had her head down in the wash-tub, and, hot and weary, was bending all her efforts to complete her task, when a fearful cry made her turn, and there was the child, clutched by one shoulder, in the jaws of a great she-wolf, the other arm extended to her. The woman was so close that she grasped a bit of the child's little petticoat in her hand, and with the other hand, screaming frantically, beat the wolf with all her force to make it let go its hold. But those relentless jaws stirred not for the cries of a mother—that gaunt form cared not for the blows of a woman. The animal set off at full speed with the child, dragging the mother along, who clung with desperation to her grasp. Thus they continued for two or three dreadful minutes, the woman only just able to hold on. Soon the wolf turned into some low, uneven ground, and the woman fell over the jagged trunk of a tree, tearing in her fall the piece of petticoat, which now only remained in her hand. The child hitherto had been aware of its mother's presence, and, so long as she clung, had not uttered a scream; but now the little victim felt itself deserted, and its screams resounded through the wood. The poor woman rose in a moment, and followed over stock and stone, tearing herself pitifully as she went, but knowing it not; but the wolf increased in speed, the bushes grew thicker, the ground heavier, and soon the screams of the child became her only guide. Still she dashed on, frantic with distress, picked up a little shoe which the closing bushes had rubbed off, saw traces of the child's hair and clothes on the low, jagged boughs, which crossed the way; but oh! the screams grew fainter, then louder, and then ceased altogether!

“The poor mother saw more on her way, but I can't tell what that was,” said the lady, her voice choked with horror, and her fair face streaming with tears. Her hearers did not press to know, for they were chilled enough already. “And only think,” she continued, “of the wretchedness of the poor afflicted creature when her husband returned at night and asked for the child. She told me that she placed the piece of petticoat and the little shoe before him, but how she told him their great misery God only knows! she has no recollection. And now you don't wonder,” she added, “that I shuddered at seeing those footprints;” and she shuddered again. “Sometimes I am in terror when my children are longer out of my sight than usual, and fancy every person that approaches me is charged with some dreadful announcement; but God avert this! mistrust is wrong.”

With these words the circle broke up. The long *droschky*, like a *chaise-longue* put upon wheels, came to the door, and the guests drove off. It was one of those exquisite nights peculiar to these climes, which the French aptly term *les nuits blanches*—a night, light without moon, a day shaded without clouds, the last glow of evening, and the first grey of morning melted together; a period when all the luminaries of the heavens seem to rest their beams without withdrawing them. The cousins stood at the door, hand in hand, gazing in the direction which their guests had taken; and a

looker-on might have imagined they were envying them that calm, cool drive. But they envied them not; they honored all that was good in this strange land, and prized all who were good to them; but a sense of solitude hung heavily upon them in the society of others, which only the solitude of their own could dispel. They had much, also, to say to one another, which a native of these climes could not comprehend, or would not like. Not that they said ought that was strange, or wrong, or unkind; but they spoke as they thought, and they thought unlike all the world around them. So they lingered beneath that beautiful light, talking calmly of what was peculiar in their lot, yet not complaining of the evil, but rather extracting the good; and they spoke, too, as those speak who have no time to lose, but rather much to recover, plainly, earnestly, and touchingly, because so truly; each seeking to give knowledge of her own mind, and comfort to that of her companion. And from that which concerned their own hearts individually, they soon passed on to that which concerns every heart that beats; and thoughts came which all have heard, but not all have listened to—thoughts which are locked to some, checked to others, and not even breathed freely to the most kindred spirit, except at those moments, few and fleeting, which favor their utterance and suit their sacredness. They discoursed on the wonderful economy of happiness in a world full of woe; how, the fewer the joys, the higher the enjoyment, till the last and highest of all, true peace of mind, is found to contain every other. And they then spoke of the blessing of sorrow and the mystery of sin, and turning to her companion that angel's face, more angelic still in the soft light, and with a transition of expression peculiar to herself, the lady added—

"And sin brought the wolves too, dear one!"

"True, true," said Louisa; "I thought of that when the poor beast lay dead at our feet today."

And so they turned and went into the house.

They now took their usual last look at the children, who slept in opposite cots in the same room. Each lay the sleeping effigy of her waking self. The eldest, composed, cool, and orderly; with pale cheek and smooth hair; the limbs straight, the head gently bent, the bed-clothes lying unruffled upon the regularly heaving chest; all that was beautiful, gentle, and meek; looking as if stretched out for a monumental effigy. On the other side, defying all order and bursting all bounds, was the little Constance, flushed, tumbled, and awry; the round arms tossed up, the rosy face flung back, the bed-clothes pushed off, the pillow flung out, the nightcap one way, the hair another; all that was disorderly and most lovely by day.

"Come, my lovely one, mamma will set all to rights!" And, with a few magical movements, which the young mother's hand best knows, the head was raised up, the limbs smoothed down, the little form adjusted into a fresh position, and, with sighs and smiles, and a few murmuring sounds, the blooming creature was fast asleep again.

"Only think, that poor woman's child was the age of Constance!"

"Don't think of it," said Louisa, "it will haunt your sleep;" and she led her cousin to her room through the children's, where they parted for the night.

"You need not shut the children's door, nor any as you go along; the house is oppressively warm, and Constance is hot."

Louisa came through two halls and down the corridor, looked at the door into the new building, and remembered that the bar had again been forgotten; pushed the box again up, and then went into her own room and shut the door.

The night, as we have described, was one of those which seem too good to be passed in sleep. Louisa was sad and serious, and all without and within tempted her to watch. But so long as the heaviness of the heart can yield to that of the head, there is not much that is amiss in either. By the time, therefore, that she had fully resolved to lie awake, recalling old griefs and conjuring up new, past and future, with their cares and fears, had vanished away, and of the present she knew as little as the children she had left in their cots.

How long this lasted she knew not, some hours it seemed, when she was roused by a sound in the adjoining unfinished building. At first the drowsy senses paid little attention, and dozed on; but again she was roused louder and louder, and, starting up, she shook off sleep, flew out of bed, and, opening the door, looked into the dark passage. To her astonishment the door into the new building was half open; she advanced to shut it, when again a noise made her turn her head in the opposite direction; and there—oh, heavens! the poor girl's blood froze in her veins—there, stealing down the passage, its back towards her, was—a wolf! An exclamation of horror, which burst from her lips, disturbed the animal; it turned, and the light from the half-open door shone on its green eyes and white teeth as it sprang upon her. With one convulsive bound Louisa cleared the threshold, dashed her door to, locked it, barred it, flung a chair against it, and, this done, stood in a state of agony for which no words exist. She seemed to see all in a moment; herself safe, but those children—those children! not a door closed between them and those dreadful jaws! She was stupified with terror; and a strange, dinning sound, like her heart's own throbbing, filled her ears, and shut out every other sense. "*Dreist wie ein Wolf!—Dreist wie ein Wolf!*" she repeated twice, mechanically; and then, forcing herself from the fainting, trance-like feeling that oppressed her, she thought for one moment that she would follow the wild beast. Her hand was on the lock, but she looked round for some weapon of defence. There was not a thing she could use—not a stanchion to the window, not a rod to the bed. Then she listened at the door, and distinctly heard the trampling claws on the boards. The animal was still close to her door, and there was time, if she could keep her senses together, to consider some means of help. Oh, if she could but have stopped that dinning sound in her ears! but it came again, beating louder and louder, and perfectly paralyzed her. The effort to open the window restored her. How she got out she knew not, but there she was on the damp ground, alone in the open garden. And now there was no time to be lost; she had to get round the end of the house which was half closed up with bushes, half blocked up with building materials, stones, and timber. But the night had grown darker; she could not see the path; she knew that she was losing time, and yet that all depended on her haste; she felt fevered with impatience, yet torpid with terror. At length she disengaged herself from the broken, uneven

ground, and struggled forward. There were the windows of the children's and her cousin's rooms; she had fancied that she could open them with her own hands, and call to those within; but how confused was her head! they belonged to a later part of the house, and were much higher than her own. She called and called, but her voice failed, and no one answered; she stooped for a stone or something to throw up, but only soft grass or moist leaves came into her hand. Suddenly a scream was heard, it was Constance's voice—scream over scream. Frantic with terror, Louisa now dashed to another part of the house where the servants slept. As she reached it, a figure came towards her. Thank Heaven, it was old Pertel! But those screams!—they reached her louder and louder! She could only ejaculate, "*Weiche Preilns!—Weiche Preilns!*"—"The little ladies—the little ladies!" But he seemed neither to heed her words, nor the thrilling sounds that impelled them, and took her hand, in peasant fashion, to kiss it. "*Weiche Preiln!—Weiche Preiln!*" she reiterated; but again he took her hand. She struggled, but he held it firm. She looked down, and there was the fairest, softest hand locked round hers; she looked up, and there was the sweetest, gentlest face bent laughing over her.

"I must say, darling, you speak better Esth-nish in your sleep than you do when you are awake. What has made you sleep so late? Olga has been knocking twice at your door—she would not come in unbidden for the world—and Constance has been screaming, in one of her fits of play, till the whole house heard her. And when I came at last, and took your hand to waken you, you only knocked it aside, and ejaculated, '*Weiche Preiln!*' with such a pitiable expression, that I woke you with my laughing. How sound you have slept!"

"Slept!" said Louisa, "indeed I have—such a sleep as I never wish for again! But I see it all; the wolf of yesterday—Olga's knocking—Constance's screaming—your hand!" And so she related her dream.

The cousins laughed together, but also thanked God together that such scenes only exist in dreams. For wolves neither jump up to windows nor open doors, nor walk up and down corridors. Nevertheless, a bar was put on to that door before night.

From Fraser's Magazine.

BON GAULTIER'S BOOK OF BALLADS.*

FUN! fun! fun! is a common weekly motto now-a-days for the contents of some singularly dull journal. The author of this volume does not adopt the fashionable motto, but in his sparkling pages he gives us the real thing. Since our introduction in boyhood to Colman's *Broad Grins*, we have met with no volume of sportive verses which has afforded us half so much laughter. Let it not be imagined, however, that there is any similarity between the two works, except in their potential power over the nerves and muscles of the risible animal. Colman's book is a collection of comic tales in flowing verse, glittering with puns, and rich with *double entendre*. Bon Gaul-

* The Book of Ballads. Edited by Bon Gaultier, and Illustrated by Alfred Crowquill. London, 1845. W. S. Orr and Co., Amen Corner.

tier, on the other hand, presents us with a genuine bundle of ballads, various in form and character, and each and all parodistic of the style and the characteristic effusions of some one or other of our lyric writers, either recently dead or still flourishing, amongst articulately speaking men, after his peculiar fashion, and according to his capability. But let him speak for himself:—

"L' Envoy.

"Come, buy my lays, and read them if you list;
My pensive public, if you list not, buy.
Come, for you know me. I am he who sung
Of Mister Colt, and I am he who framed
Of Widdicombe the wild and wondrous song.
Come, listen to my lays, and you shall hear
How Wordsworth, battling for the laureate's
wreath,
Bore to the dust the terrible Fitzball;
How N. P. Willis for his country's good,
In complete steel, all bowie-knived at point,
Took lodgings in the Snapping Turtle's womb.
Come, listen to my lays, and ye shall hear
The mingled music of all modern bards
Floating aloft in such peculiar strains,
As strike themselves with envy and amaze;
For you 'bright-harped' Tennyson shall sing,
Macaulay chant a more than Roman lay,
And Bulwer Lytton, Lytton Bulwer erst,
Unseen amidst a metaphysic fog,
Howl melancholy homage to the moon;
For you once more Montgomery shall rave
In all his rapt rabidity of rhyme,
Nankeened Cockaigne shall pipe its puny note,
And our Young England's penny trumpet blow."

The ballads are of all sorts, except bad and indifferent; that is to say, they are of all sorts of climate and country,—English, Scotch, American, German, Spanish, French, Turkish, and finally, Utopian. Taken in one aspect, they give evidence of Bon Gaultier's wonderful command over our language, and his exquisite facility of versification; while in another they show how plastic are his powers of imitation, and how perfect his apprehension of the very spirit of the writer whose verses he parodies; and, be it observed, that nothing can be farther from his intention than to disparage the effusions of those worthy children of the Muse with whose productions he deals; his sole object is to disport his fine powers in merriment, and to make his readers share that frank and genial merriment in which he revels. His is not the soul that could be insensible to the glories which crown the lays of Wordsworth and Southey, of Lockhart and Macaulay. His is not the hand that would tear one leaf of laurel from their honored brows; and, with respect to the feebler children of song, if there be any under-current of bitter ridicule in his ludicrous imitations, it could not well be avoided, as it consists chiefly in the fact, that the parody is more vigorous and harmonious than the original. He cannot conquer quite the difficulty of writing down to an imitation of the effusions of these small fry of literature; the fiery spirit unconsciously flashes forth ever and anon; the stalwart hand discloses its powers through the ruffie in which he wraps it. Tom Moore sings,—

"Where bright eyes so abound, boy,
'T is hard to choose, 't is hard to choose."

And we say to our readers, Where good and right

funny ballads abound, boys, 't is hard to choose. But for our love for the thundering versification of Lockhart's *Spanish Ballads*, and from many pleasant reminiscences of drollest Andrew Ducrow and his theatre—the true national theatre; for there alone is it we have our national achievements presented in dramatic form to stir the hearts and minds of future Nelsons and Wellingtons—we will turn, in the first instance, to "The Lay of Don Fernando Gomersalez."

It is unnecessary to point out the fine lay of Lockhart's of which it is a parody. But, for the sake of such of our readers as have never had the good fortune to see the grand equestrian and dramatic spectacles at Astley's—our readers, for example, bred in the seclusion of the country, or born in our Indian empire or our distant colonial possessions—it is requisite we should state that Mr. Gomersal has been for many years the representative of the foreign heroes in the wars waged on the Astleian boards. Ducrow, who now, alas!

"Sleeps the sleep
That knows no waking,"

but, still true to his vocation, sleeps, melodramatically, in his grand mausoleum in the cemetery at Kensal Green, was too great a patriot not to reserve to himself the personation of all our native heroes, (to say nothing of our patriot saint, the good knight St. George,) from the Sir Lancelots, and Sir Percivals, and Sir Gawains, of the Table Round, to the Marquess of Anglesea and the Duke of Wellington, of our living chivalry. But Gomersal was, and delighted are we to say is, the embodiment in the flesh of the mighty warriors who have fallen before British prowess, and especially of the greatest of them all, Napoleon Bonaparte. Indeed, his likeness to the emperor is so marvellous, that, in the strictest sense of the words, he may be said to double his part when he appears upon the field of Waterloo, *en petit chapeau et redingote gris*, with the *petite épée* by his side, in white smalls and long jacks, grim with despair as he sees that the stupid English *will not* find out that they are beaten; and fiercely taking snuff as he orders charge after charge, in whirlwind vehemence, against the serried ranks of "that astonishing infantry." It will now be understood how appropriately is Gomersal made the hero of this lay of foreign "derring do." Mr. Widdicombe, it must next be told, is the urbane, the witty, the accomplished, and the venerable master of the ring. Great in his professional career, still greater as the oracle of the neighboring hostelry, where he is reverentially regarded as the writer of the principal leaders in the *Times*. With this explanation we may pass on to the story of the ballad. It will be remembered on a day of high triumph and solemnity "in Grenada's royal town," the Moorish king, hurt in his pride, as he presides at the tournament, at the praises by his minister of a captive Spanish knight, causes him to be released from his dungeon, and promises him life and liberty if he can overthrow in combat three Moorish champions before the sun has sunk below the horizon. Then quoth Don Fernando Gomersalez to the monarch Al-Widdicombe:—

"Give me but the armor, monarch, that I wore
within the field,
Give me but my trusty helmet, give me but my
dinted shield,

And my old steed, Bavioca, swiftest courser in
the ring,
And I rather should imagine that I 'll do the busi-
ness, king!"

Then they carried down the armor from the garret
where it lay,
Oh, but it was red and rusty, and the plumes were
shorn away;
And they led out Bavioca, from a foul and filthy
van,
For the conqueror had sold him to a Moorish
dogs'-meat man.

When the steed beheld his master, then he whin-
nied loud and free,
And, in token of subjection, knelt upon each
broken knee;
And a tear of walnut largeness to the warrior's
eyelids rose,
As he fondly picked a beanstraw from his cough-
ing courser's nose.

'Many a time, O Bavioca, hast thou borne me
through the fray!
Bear me but again as deadly through the listed
ring this day;
Or if thou art worn and feeble, as may well have
come to pass,
Time it is, my trusty charger, both of us were
sent to grass!"

Then he seized his lance, and, vaulting in the sad-
dle, sat upright,
Marble seemed the noble courser, iron seemed the
mailed knight;
And a cry of admiration burst from every Moorish
lady—
'Five to four on Don Fernando!' cried the sable-
bearded cadi.

Warriors three from Alcantara burst into the
listed space,
Warriors three, all bred in battle, of the proud
Alhambra race:
Trumpets sounded, coursers bounded, and the
foremost straight went down,
Tumbling, like a sack of turnips, just before the
jeering clown.

In the second chieftain galloped, and he bowed to
the king,
And his saddle-girths were tightened by the master
of the ring;
Through three blazing hoops he bounded ere the
desperate fight began—
'Don Fernando! bear thee bravely!—'t is the
Moor Abdorrhoman!

Like a double streak of lightning, clashing in the
sulphurous sky,
Met the pair of hostile heroes, and they made the
sawdust fly;
And the Moslem spear so stiffly smote on Don Fer-
nando's mail,
That he reeled, as if in liquor, back to Bavioca's
tail.

But he caught the mace beside him, and he griped
it hard and fast,
And he swung it starkly upwards as the foeman
bounded past;
And the deadly stroke descended through the skull
and through the brain,
As ye may have seen a poker cleave a cocoa-nut
in twain.

Sore astonished was the monarch, and the Moorish warriors all,
 Save the third bold chief, who tarried and beheld his brethren fall;
 And the clown, in haste arising from the footstool where he sat,
 Notified the first appearance of the famous Acrobat?

Never on a single charger rides that stout and stalwort Moor,
 Five beneath his stride so stately bear him o'er the trembling floor;
 Five Arabians, black as midnight, on their necks the rein he throws,
 And the outer and the inner feel the pressure of his toes.

Never wore that chieftain armor: in a knot himself he ties,
 With his grizzly head appearing in the centre of his thighs;
 Till the petrified spectator asks, in undisguised alarm—
 Where may be the warrior's body?—which is leg, and which is arm?

'Sound the charge!' the coursers started; with a yell and furious vault,
 High in air the Moorish champion cut a wondrous somersault;
 O'er the head of Don Fernando like a tennis-ball he sprung,
 Caught him tightly by the girdle, and behind the crupper hung.

Then his dagger Don Fernando plucked from out its jewelled sheath,
 And he struck the Moor so fiercely, as he grasped him beneath,
 That the good Damascus weapon sunk within the folds of fat,
 And, as dead as Julius Cæsar, dropped the Gordian Acrobat.

Meanwhile fast the sun was sinking—it had sunk beneath the sea,
 Ere Fernando Gomersalez smote the latter of the three;
 And Al-Widdicombe, the monarch, pointed, with a bitter smile,
 To the deeply darkening canvass—blacker grew it all the while.

'Thou hast slain my warriors, Spaniard! but thou hast not kept thy time;
 Only two had sunk before thee ere I heard the curfew chime;
 Back thou goest to thy dungeon, and thou may'st be wondrous glad,
 That thy head is on thy shoulders for thy work to day, my lad!

Therefore all thy boasted valor, Christian dog, of no avail is!
 Dark as midnight grew the brow of Don Fernando Gomersalez;—
 Stiffly sat he in his saddle, grimly looked around the ring,
 Laid his lance within the rest, and shook his gauntlet at the king.

'O, thou foul and faithless traitor! wouldst thou play me false again?
 Welcome death and welcome torture, rather than the captive's chain;

But I give thee warning, caitiff! Look thou sharply to thine eye—
 Unavenged, at least in harness, Gomersalez shall not die!

Thus he spoke, and Bavioca like an arrow forward flew,
 Right and left the Moorish squadron wheeled to let the hero through;
 Brightly gleamed the lance of vengeance—fiercely sped the fatal thrust—
 From his throne the Moorish monarch tumbled lifeless in the dust.

Speed thee, speed thee, Bavioca! speed thee faster than the wind!
 Life and freedom are before thee, deadly foes give chase behind:
 Speed thee up the sloping spring-board; o'er the bridge that spans the seas;
 Yonder gauzy moon will light thee through the grove of canvass trees.

Close before thee Pampeluna spreads her painted pasteboard gate!
 Speed thee onward, gallant courser, speed thee with thy knightly freight—
 Victory! the town receives them!—Gentle ladies this the tale is,
 Which I learned in Astley's Circus, of Fernando Gomersalez."

We must give one more extract from this portion of the work—the Spanish ballads. But that which we quote reminds us not alone of the Spanish, but of an ode, with the slenderest possible materials for a story, on which Shelley has lavished the most wonderful pomp of melodious diction, and poured forth a multitude of epithets as rich in gorgeous illustration as the Greek tongue itself could supply. The pursuit of Arethusa by Alpheus will spring to the reader's mind. We quote a passage from the exquisite version of the old Greek fable in startling contrast with the mimic lay about the pursuit round the ring of Miss Woolford by Mr. Gomersal:—

"Arethusa arose
 From her couch of snows
 In the Acroceraunian mountains,
 From cloud and from crag,
 With many a jag,
 Shepherding her bright fountains.
 She leapt down the rocks
 With her rainbow locks
 Streaming among the streams,
 Her steps paved with green
 The downward ravine
 Which slopes to the western gleams:
 And, gliding and springing,
 She went ever singing
 In murmurs as soft as sleep;
 The earth seem'd to love her,
 And heaven smiled above her,
 As she linger'd towards the deep."

Well, Alpheus pursues, and the chase, to a dull utilitarian, would seem as bootless and fantastical as that in the ring at Astley's; but how charming the music of the story:—

"The beard and the hair
 Of the river-god were
 Seen through the torrent's sweep
 As he followed the light
 Of the fleet nymph's flight

To the brink of the Dorian deep.
 'Oh, save me! oh, guide me!
 And bid the deep hide me,
 For he grasps me now by the hair.'
 The loud ocean heard
 To its blue depths stirr'd
 And divided at her prayer;
 And under the water
 The earth's white daughter
 Fled like a sunny beam.
 Behind her descended
 Her billows, unblended
 With the blackish Dorian stream.
 Like a gloomy stain
 On the emerald main
 Alpheus rush'd behind,
 As an eagle pursuing
 A dove to its ruin
 Down the streams of the cloudy wind.
 Under the bowers,
 Where the ocean powers
 Sit on their pearly thrones;
 Through the coral woods
 Of the weltering floods;
 Over heaps of unvalued stones;
 Through the diu beams
 Which amid the streams
 Weave a network of color'd light;
 And under the caves
 Where the shadowy waves
 Are as green as the forest's night;
 Outspeeding the shark
 And the swordfish dark
 Under the ocean foam,
 And up through the rifts
 Of the mountain cliffs,
 They pass'd to their Dorian home."

We now quote the Astleian-Spanish ballad:—

"The Courtship of our Cid."

"What a pang of sweet emotion
 Thrill'd the Master of the Ring,
 When he first beheld the lady
 Through the stabled portal spring:
 Midway in his wild grimacing
 Stopp'd the piebald-visaged clown,
 And the thunders of the audience
 Nearly brought the gallery down.
 Donna Inez Woolfordinez!
 Saw ye ever such a maid,
 With the feathers swailing o'er her,
 And her spangled rich brocade?
 In her fairy hand a horsewhip,
 On her foot a buskin small;
 So she stepr'd, the stately damsel,
 Through: the scarlet grooms and all.
 And she beckon'd for her courser,
 And they brought a milk-white mare;
 Proud, I ween, was that Arabian
 Such a gentle freight to bear:
 And the master moved towards her,
 With a proud and stately walk,
 And in reverential homage,
 Rubb'd her soles with virgin chalk.
 Round she flew as Flora flying
 Spans the circle of the year;
 And the youth of London, sighing,
 Half forgot the ginger-beer—
 Quite forgot the maids beside them;
 As they surely well might do,

When she raised two Roman candles
 Shooting fireballs red and blue!
 Swifter than the Tartar's arrow,
 Lighter than the lark in flight,
 On the left foot now she bounded,
 Now she stood upon the right.
 Like a beautiful Bacchante,
 Here she soars, and there she kneels;
 While amid her floating tresses,
 Flash two whirling Catherine wheels!

Hark! the blare of yonder trumpet!
 See, the gates are open'd wide!
 Room, there, room for Gomersalez—
 Gomersalez in his pride!
 Rose the shout of exultation,
 Rose the cat's triumphant call,
 As he bounded, man and courser,
 Over master, clown, and all!

Donna Inez Woolfordinez!
 Why those blushes on thy cheek?
 Doth thy trembling bosom tell thee,
 He hath come thy love to seek?
 Fleet thy Arab—but behind thee
 He is rushing, like a gale;
 One foot on his coal-black's shoulders,
 And the other on his tail!

Onward, onward, panting maiden!
 He is faint and fails—for now
 By the feet he hangs suspended
 From his glistening saddle-bow.
 Down are gone both cap and feather,
 Lance and gonfalon are down!
 Trunks, and cloak, and vest of velvet,
 He has flung them to the clown.

Faint and failing! Up he vaulteth,
 Fresh as when he first began;
 All in coat of bright vermilion,
 'Quipped as Shaw the Life-Guardsman!
 Right and left his whizzing broadsword,
 Like a sturdy flail he throws;
 Cutting out a path unto thee,
 Through imaginary foes.

Woolfordinez! speed thee onward!
 He is hard upon thy track—
 Paralyzed is Widdicombez,
 Nor his whip can longer crack;
 He has flung away his broadsword,
 'T is to clasp thee to his breast.
 Onward! see, he bares his bosom,
 Tears away his scarlet vest,

Leaps from out his nether garments,
 And his leathern stock unties—
 As the flower of London's dustmen,
 Now in swift pursuit he flies.
 Nimble now he cuts and shuffles,
 O'er the buckle, heel and toe!
 And, with hands deep in his pockets,
 Winks to all the throng below!

Onward, onward rush the coursers,
 Woolfordinez, peerless girl,
 O'er the garters lightly bounding,
 From her steed with ziry whirl!
 Gomersalez, wild with passion,
 Danger—all but her—forgets;
 Wheresoe'er she flies, pursues her,
 Casting clouds of somersets!

Onward, onward rush the coursers,
 Bright is Gomersalez' eyes;

Saints protect thee, Woolfordinez,
For his triumph, sure, is nigh!
Now his courser's flanks he lashes,
O'er his shoulders flings the rein,
And his feet aloft he tosses,
Holding stoutly by the mane!

Then, his feet once more regaining,
Doffs his jacket, doffs his smalls:
And in graceful folds around him
A bespangled tunic falls.
Pinions from his heels are bursting,
His bright locks have pinions o'er them;
And the public sees with rapture
Maia's nimble son before them.

Speed thee, speed thee, Woolfordinez!
For a panting god pursues;
And the chalk is very nearly
Rubbed from thy white satin shoes!
Every bosom throbs with terror,
You might hear a pin to drop;
All was hush'd save where a starting
Cork gave out a casual pop.

One smart lash across his courser,
One tremendous bound and stride,
And our noble Cid was standing
By his Woolfordinez' side!
With a god's embrace he clasped her,
Raised her in his manly arms;
And the stables' closing barriers
Hid his valor and her charms!"

For the sake of exhibiting the ludicrous contrast, we cannot refrain from setting beside the conclusion of this ballad the closing lines of Shelley's *Arethusa* :—

"And now from their fountains
In Enna's mountains,
Down one vale, where the Morning basks,
Like friends once parted
Grown single-hearted,
They ply their watery tasks.
At sunrise they leap
From their cradles steep
In the cave of the shelving hill,
At noontide they flow
Through the woods below
And the meadows of asphodel;
And at night they sleep
In the rocky deep
Beneath the Ortygian shore,
Like spirits that lie
In the azure sky,
Where they love but live no more."

Whoever has marked the soldierly attitude, heard the short, sharp, abrupt sentences, and the military tones of the Great Duke in addressing the House of Lords, cannot fail to be much amused with the following :—

"*Sonnet to Britain.*

"BY THE D— OF W—.

"Halt! Shoulder arms! Recover! As you were!
Right wheel! Eyes left! Attention! Stand at ease!

O Britain! O my country! Words like these
Have made thy name a terror and a fear
To all the nations. Witness Ebro's banks,
Assaye, Toulouse, Nivelle, and Waterloo,

Where the grim despot muttered, 'Saave qu'peut!'

And Ney fled darkling.—Silence in the ranks!
Inspired by these, amidst the iron crash
Of armies, in the centre of his troop
The soldier stands—unmovable, not rash,
Until the forces of the foemen droop;
Then knocks the Frenchmen to eternal smash,
Pounding them into mummy. Shoulder, hoop!"

Here is a specimen of an imitation of the roll of Macaulay's long lines :—

"*Fytte the First.*

"What news, what news, thou pilgrim gray,
What news from southern land!
How fare the bold conservatives, how is it with Ferrand?
How does the little Prince of Wales? how looks our lady queen?
And tell me is the gentle Brough once more at Windsor seen?"

'I bring no tidings from the court, nor from St. Stephen's hall!
I've heard the thundering tramp of horse and the trumpet's battle-call;
And these old eyes have seen a fight, which England ne'er hath seen,
Since fell King Richard sobbed his soul through blood on Bosworth Green.'

Here are next two right funny specimens of the absurd facility of Tennysonian verse :—

"*Caroline.*

"Lightsome, brightsome, couain mine!
Easy, breezy Caroline!
With thy locks all raven shaded,
From thy merry brow up-braided,
And thine eyes of laughter full,
Brightsome cousin mine!
Thou in chains of love hast bound me—
Wherefore dost thou sit around me,
Laughter-loving Caroline!"

When I fain would go to sleep
In my easy-chair,
Wherefore on my slumbers creep!
Wherefore start me from repose,
Tickling of my hooked nose,
Pulling of my hair!
Wherefore, then, if thou dost love me,
So to words of anger move me,
Corking of this face of mine,
Trickey cousin Caroline!"

When a sudden sound I hear,
Much my nervous system suffers,
Shaking through and through—
Cousin Caroline, I fear,
'T was no other hand but you
Put gunpowder in the snuffers,
Springing such a mine!
'T was no other but yourself,
Wicked-trickéd, little elf,
Naughty cousin Caroline!"

The second specimen is entitled,

"*The Biter Bit.*

"The sun is in the sky, mother, the flowers are springing fair,
And the melody of woodland birds is stirring in the air;

The river, smiling to the sky, glides onward to
the sea,
And happiness is everywhere, oh, mother, but
with me !

They are going to the church, mother—I hear
the marriage bell ;
It rises o'er the upland, it haunts me like a knell ;
He leads her on his arm, mother, he cheers her
faltering step,
And she clings closely to his side, she does, the
demirep !

They are crossing by the stile, mother, where we
so oft have stood—

The stile beside the thorn at the corner of the
wood ;

The boughs, that oft have echoed back the words
that won my ear,

Now bend their blossoms o'er him as he leads his
bridal fere.

He will pass beside the stream, mother, where
first my hand he pressed,

By the meadow where, with quivering lip, his
passion he confessed ;

And down the hedgerows where we've strayed
again and yet again ;

Yet he will not think of me, mother, his broken-
hearted Jane !

He said that I was proud, mother—he said I
looked for gold ;

He said I did not love him—that my words were
few and cold ;

He said I kept him off and on, in hopes of higher
game—

And it may be that I did, mother—but who has n't
done the same !

I did not know my heart, mother—I know it now
too late ;

I thought that I without a pang could wed some
nobler mate ;

But no nobler suitor sought me, and he has gone
elsewhere,

And my heart is gone, and I am left to wither in
despair.

You may lay me in my bed, mother, my head is
throbbing sore ;

And mother, prithee let the sheets be duly aired
before ;

And, if you would do pleasure to your poor de-
pending child,

Draw me a pot of beer, mother, and, mother,
draw it mild !

One more extract, and then we have done. It
is from "The Queen in France; an Ancient
Scottish Ballad:"—

"They hadna sailed a league, a league—
A league, but barely twa,

When the lift grew dark, and the waves grew wan,
And the wind began to blow.

'O weel, weel may the waters rise,
In welcome o' their queen ;

What gars ye look sae white, Albert,
What makes your e's sae green ?"

' My heart is sick, my heid is sair,
Gie me a glass o' the gude brandie :
To set my foot on the braid green sward,
I'd gie the half o' my yearly fee.

' It's sweet to hunt the sprightly hare
On the bonny slopes o' Windsor lea,
But O, it's ill to bear the thud
And pitching o' the saut, saut sea ! "

In conclusion, it is scarcely necessary for us
to remark that the effusions of Bon Gaultier in
this volume are merely the results of high spirits
and a few leisure hours of one of the first scholars
of the day, and one of the very best original writ-
ers in prose and verse.

But though we have spoken the farewell to our
gentle reader, the word that ever has been and
must be, let us claim to be allowed the Hibernian
privilege of one word more, and it will be to show
the versatility of Bon Gaultier's genius, frolick-
some and ludicrous, without the stain of ribaldry,
or the plague-spot of ill-nature. He who tells us
in *l'Envoy* to this *Book of Ballads*—

" I am he who sang
Of Mr. Colt, and I am he who framed
Of Widdicombe the wild and wondrous lay,"

is, at the same time, one of the best translators of
the loose and passionate gentleman Catullus, the
mystic Goëthe, and the towering Schiller ; and he
has even dealt with Dante with a fervor, and
energy, and vigor, which clearly point him out as
a man who might prove himself a capable and
worthy translator of the mighty Florentine's
works into our vernacular : " Si illi ullum tribu-
eretur vacuum tempus et liberum : neque enim
occupatâ operâ, neque impedito animo, res tanta
auscipi potest : utrumque opus est et curâ vacare
et negotio." We give one specimen, a short one,
from a canzone of Dante's, of Bon Gaultier's per-
fect mastery of pure, rich, old English, ere it be-
came *mountebanked by sesquipedalia verba*, founded
on the stilted Latin of the orators—of his perfect
and peculiar familiarity with and capability of
adopting in our tongue the rhythm of Dante, and
of his power of entering into the depths of Dante's
soul, and giving utterance to its inspirations :—

" Yes, Beatrice is gone to yonder heaven,
To realms where angels dwell and are in peace ;
You ladies hath she left with them to stay,
She was not hence like other mortals riven,
By chill or calenture, or such disease,
But for her mighty worth was borne away.
For her meek nature shed so bright a ray,
It beamed to heaven, and with a light so blest,
As woke amaze in the Eternal Sire,
And kindled sweet desire
To call a soul so lovely to his rest.
Then made He it from earth to Him to aspire,
Deeming this life of care and sorrowing
Unworthy of so fair and pure a thing."

INCOME TAX.—The number of persons who
return themselves to the income tax as having
150*l.* per annum and no more, is 200,000. Thus,
then, one fifth of the five millions is paid to this
odious tax by exactly the very class who can least
afford it.

From Chambers' Journal.

BOOKSELLING ABROAD.

In treating of any subject respecting books, it is difficult to get away from Germany. There modern literature first took root, and, nurtured by the press, branched off into the "utmost corners of the earth." There also literary commerce has been reduced to a system more complete and effectual than in any other country in which "the trade" flourishes. It is to Germany, therefore, that our present notices of the book-trade must be for a while confined.

Piracy and fraud are as old as bookselling itself. The ingenious devices of the dishonest kept pace with the extensive development of the book-trade by the printer's art; and as soon as a publisher became famous for the correctness and legible neatness of his editions, his name and "marks" were fraudulently forged by inferior typographers, to insure a readier sale for works than their own merits would have procured. We must here digress for a moment, to say a word concerning the symbols adopted by the old booksellers, who were (and by the book-fancier still are) so well known by the devices they placed on their title-pages, that neither their name nor place of residence was necessary. Of these marks, the best known are as follows:—The anchor, the sign adopted by Raphelengius of Leyden; an anchor, with a dolphin twisted round it, was the symbol of the Mavutti of Venice and Rome. The Stephenses of Paris and Geneva put forth the olive-tree; and the Elzevirs of Amsterdam adopted the same symbol. The signs of the Zodiac were likewise appropriated as marks by some publishers; while others constructed rebuses. Thus, Richard Harrison, an English printer, who died in 1562, printed on his title-pages a *hare*, a sheaf of *rye*, and a representation of the *sun*. William Norton, who, besides a bookseller, was treasurer of Christ's Hospital, (1593,) had a "sweet *William*" growing out of a *tun*, inscribed with the word *nar*. Others equally puerile might be cited. The literary pirates, who forged the marks of the best booksellers, chiefly resided in Geneva and Vienna. In the last-named city, one J. Thomas Edler Von Trattner made himself as famous in the book-trade by the daring boldness of his piracies, as the Saltee rovers did amongst the shipping interests of the civilized world. No sooner had a printer put forth a carefully-prepared edition of some valued classic, than these forgers set their presses to work, and produced an exact imitation of it at a much lower price. This system had risen by the year 1765 to a pitch so ruinous to the regular trade, that the German publishers entered into a confederacy to put a stop to it. Erasmus Reich, one of the partners in the Weidmannsche Buchhandlung, (an extensive publishing concern,) called a meeting at Frankfurt, and proposed certain laws and regulations, the chief object of which was to tie down the booksellers of Germany not to sell any copies of the spurious editions. To this agreement fifty-nine booksellers subscribed. By the year 1797, the association spread its influence throughout the country, and ever since the latter year, no person can sell a book without being a member of the German booksellers' association (Deutschen Buchhändler Verein) of Leipsic, to which place the book-trade has since been concentrated. By means of this concentration, improvements have gradually been made in the organization of the

book-trade, until formed into the system it is at present—an explanation of which will be found interesting.

The book-trade of Germany is divided into three distinct branches—1st, That of the publisher (Verlagsgeschäft); 2d, The booksellers' business (Sortimentshandel); 3d, The agencies (Commissionsgeschäft). The first two branches are frequently united, and often all three are carried on together. The business of the publisher needs little description. He buys the manuscript from the author, and gets it printed, either by his own presses, or by other parties for his account, and sends copies to such booksellers as he thinks likely to sell the work. The invoice is fastened on the outside of the parcel, half folded up, so that only the head, bearing the name of the bookseller to whom it is directed, and the name of the publisher from whom it comes, is to be seen. The parcels are all put in one bale, and sent to the publisher's agent in Leipsic, who distributes them to the different agents in that town. Every respectable bookseller of Germany employs an agent in Leipsic. Such copies of new works are called "Nova;" on the invoice is put "pr. Nov." (*pro Novitate*.) They are sent "on condition," (*à condition*,) that is, with the option to keep them or to send them back. The returned books are properly called *remittiren*, though more frequently and jocosely *kræbe* (crabs.) By such conditional consignments, private persons have the advantage of being able to look into the merit of a work before they are called upon to buy it, whereby new publications get to all parts of the country, and at the same price as at the place of publication—a system which is quite peculiar to the German book-trade, and which has certainly contributed much to the diffusion of knowledge in Germany. The prices are put down either at the *shop price* or *net price*. On the shop price (ordinary) a discount of one third, or thirty-three and one third per cent., is usually allowed by the publishers to "the trade" for books, and for prints and journals one fourth, or twenty-five per cent. Books which have been published for some time are seldom sent out "on condition," but must be ordered, which is done by sending a small slip of paper (*Verlagszettel*)—containing the name of the publisher, the name of the bookseller who orders, and the title of the work—to the agent of the publisher, who transmits the work by the first opportunity, and, if quickly wanted, by post. Every publisher of note sends some copies of his publications to his agent in Leipsic, in order that he may execute without delay any orders which may come in; so that the shortest and cheapest way of procuring a work is generally by sending to Leipsic for it.

At the New Year, at Easter, and at Michaelmas, the fairs before alluded to* are held at Leipsic, exclusively devoted to the sale of books. Of the three, however, the grand concentration of the trade takes place at Easter (*Jubilatemesse*); for that is the time when all accounts are, or should be, closed between the booksellers of various parts of Germany, who either attend the fair personally for that purpose, or send some confidential clerk.

Although the book-trade of Germany is centralized in Leipsic, yet it must not be supposed that it is exclusively conducted at the fairs. New publi-

* See p. 392 of our last number.

cations, though usually first issued at them, are occasionally forwarded for general distribution in the monthly parcels, of which many thousand bales annually arrive, and are sent away. Thus, wherever a book may be printed, it is invariably published or issued in Leipsic; where every local *Sortimentshändler* has his *commissionär*, or agent. Instead, therefore, of applying directly to the local publisher for a new work, he sends to this commissioner in Leipsic, and through him the order reaches its destination. If a bookseller of Berlin, for instance, has ordered books from Vienna, Strassburg, Munich, Stuttgart, and a dozen other places, they are all transmitted to his Leipsic agent, who then forwards them in one mass much more cheaply than if each portion had been sent separately and directly to Berlin.

The censorship of the press, which is exercised in every state belonging to the German confederation, opposes a great and important hindrance to the prosperity of literature, especially in a commercial point of view. Each journal and publication under twenty sheets, whatever be the subject of which it treats—politics, literature, arts, or science—must be sent in manuscript to the censor, who strikes out what he thinks proper before the printing of it is allowed. The delay, and frequently arbitrary or capricious interference arising from this system, are evident; nor can it be denied that much bad feeling and discontent are thereby created. Moreover, not only all German books published in the country are subject to this censorship, but in some of the states all books imported from other states belonging to the German confederation are similarly treated. In Austria, for instance, all books coming from Prussia, or from the minor states of Germany, are considered as foreign books, and are subject to a second censorship in that country. They are either admitted free by the word “*Admittitur*,” or admitted with the restriction not to be advertised (“*Transeat*”); sometimes they are to be delivered only to certain persons to whom the censorship has given special leave to receive them (“*Erga schedam*”); or they are totally prohibited (“*Damnatur*.”) In Prussia, all books printed out of Germany in the German language must be laid before the college of Upper Censorship (*Ober Censur Collegium*) before the sale of them is allowed. These separate interests and separate laws prove very efficacious in encouraging piracy. In Germany, neither author nor publisher has much chance of making a fortune; each state of the confederation having its own law of copyright, and the protection it affords of course only extends over the territory itself; hence, no sooner does a work of merit appear in one state than it is pirated by the next, and as the same language is common to the whole confederation, nothing more is wanted than a mere reprint. This practice affords an explanation of several peculiarities which attach to German bookselling. The most prominent of which are, firstly, the cheapness of literary labor; for a publisher cannot be expected to give much for a work which, if it be bad, has no sale, and if good, is forthwith stolen. Secondly, the frequency of publications by subscription; for there is no other method by which even authors of the greatest genius can secure a reasonable profit. Thirdly, the coarseness of paper and types for which German books are distinguished; for the publisher has no chance of competing with the pirate except by making his own edition too cheap to be undersold.

Despite these hindrances, however, “the trade” flourishes. The number of German booksellers has so much increased within the last twenty years, that many of those who have been long established are complaining of underselling and other irregularities; but in that respect the older members of the trade may be said to suffer no more than their compeers in other branches of commerce, whose profits and modes of doing business are interfered with from competition set up through the demands of an augmenting population. The number of booksellers in Leipsic in 1839 was 116; the total number in Germany was 1233, who resided in 337 towns. Besides these, were 49 booksellers belonging to German-Switzerland, and 99 foreigners who regularly do business at the Leipsic fairs.* Since 1839, however, the number of foreign houses in connection with Leipsic has increased, especially those of Great Britain. Several firms, both in London and Edinburgh, regularly attend at least one of the fairs yearly.

Having disposed of the book-trade of Germany, we now proceed to glance at that of Russia. Here the dawning of literature began with Peter the Great. The first book ever printed in the country was struck off at St. Petersburg in 1713, and the first newspaper in the year following. Now there are 25 booksellers and printers at St. Petersburg, besides several others at Moscow, Riga, Dorpat, Reval, Warsaw, and Wilna. Among the number are many German establishments, which supply that part of the population who speak the German language, and such of the natives as are fond of German literature, who are pretty numerous. In 1837, the number of new works published in Russia was 866, of which 740 were original, and 122 translated works. There were also 48 periodicals treating of politics and literature. The censorship of the press is extremely rigid.

Of the book-trade carried on in the more southern portions of Europe, Paris is the head-quarters: we shall therefore treat of French bookselling in this place. In France there is no such organization of the book-trade as in Germany. Paris is the great central point where almost all works of any renown are printed, and where the most distinguished men of letters, artists, and authors, are to be found. The booksellers of the departments, it is true, have also their agents in Paris, but they do not maintain such a regular and constant intercourse as those in Germany. Besides, the publishers (*Editurs Libraires*) seldom send their publications “*à condition*;” the booksellers (*Marchands Libraires*) must order, and generally pay for them in cash. Sometimes, however, a credit of three, four, or six months is granted. The trade allowances are regulated not as in other countries, by the sale price, but by the subjects of the works. The discount on historical, critical, and elementary books, is twenty-five per cent.; that on mathematical and strictly scientific works, is from ten to fifteen per cent.; while upon romances, tales, and literature of the lighter order, it is often as high as fifty per cent. Literary censorship was early introduced into France, and exercised most severely. Charles IX. published an edict in 1563, by which he forbade printers to issue unauthorized works “under pain of hanging or strangulation.” The censorship continued to be enforced down to the

* See the Quarterly Journal of the Statistical Society, vol. iii.

reign of Charles X., whose unfortunate ordinance of the 27th July, 1830, by which he would have further circumscribed the liberty of the press, produced the last revolution. From that time the censorship was abolished; but a sort of substitute for it remains, in the very stringent laws against libel. In the year 1830, there were in France 620 printers, residing in 283 towns, and 1124 booksellers and stationers; all of whom are obliged to be *brevetés*, that is, licensed, and sworn to abide by certain prescribed rules. A Paris paper states that their press had produced within the last year as many as 6377 works in the dead and living languages, 1398 prints and engravings, 100 musical works, 54 maps and charts; whilst the copies of newspapers struck off amounted in number to 34,750,000.

In Italy there is no regular intercourse whatever among booksellers. It is only with the greatest trouble and expense that a work published in any part of Italy can be procured in a remote town not belonging to the same government. The counterfeiting of books is so prevalent, that one printed at Milan is counterfeited at Florence, and *vice versa*. The censorship also presses heavily on all kinds of publications, much more so than in Germany. The customs' duty on foreign works is so enormous, that it is cheaper to pirate popular books than to import them. In the kingdom of the Two Sicilies, each octavo volume has to pay 3 carlini, or 1s. entrance duty; a quarto volume 6 carlini; and a volume in folio 10 carlini, or 3s. 4d.

In Holland, the chief seat of the book-trade is Amsterdam, which boasts of 80 booksellers, who have adopted the German system in dealing with their provincial brethren, of whom there are 101. In 1828 there were published in Holland 770 new books. In Belgium, Brussels is almost the only town where works of any note are published. They consist principally of republications of French and English works, which are much in demand, on account of their neatness and cheapness. There are several extensive printing establishments at Brussels, and also a joint company of publishers, whose open and avowed aim is the counterfeiting of good French and English works, published often at the same time as the original edition, or very soon after. By the constitution of 25th February, 1831, Belgium enjoys an extensive freedom of the press. In the year 1838, there appeared in Belgium 84 periodicals, of which 40 were published at Brussels.* In other continental countries, the trade carried on in books is almost nominal.

Before we glance at the book-trade at home—which we shall do in a concluding article—we must notice the increasing demand for foreign books which has recently taken place in Great Britain. From the continental peace, which, happily, has not been disturbed since 1815, the importation into this country of foreign works has steadily augmented. Free commercial intercourse once established with our continental brethren, intellectual and literary intercommunion followed; and to render this the more effectual, the French, German, and Italian languages have been of late extensively studied. Books in those languages (especially in the two former) have therefore been eagerly read, and a demand for them increases daily. Five-and-twenty years ago, there was no

* See the Quarterly Journal of the Statistical Society, vol. iii.

English bookseller who confined his trade exclusively to foreign books; now, there are at least fifty German, French, and Italian booksellers in London alone. In Edinburgh, there are three of "the trade" who make the sale of foreign works a prominent feature in their business. During the last ten years, an average of £8000 has been annually paid for duties on foreign works imported into Great Britain.* The value of such books imported in 1843 was £132,019.

The Power of the Soul over the Body, considered in relation to Health and Morals. By GEORGE MOORE, M. D., &c.

THE first apparent purpose of Dr. Moore is to prove that the soul is immaterial and has an existence separate from the body, with an action apart from the brain, and depending as a medium rather upon the nervous system. With this object he goes over a large extent of ground, physiological, metaphysical, and physical—in the sense of the disease or ill effects induced by disordered action or disordered emotions. During this long survey, he brings together a great number of curious facts relative to the operations of the mind in health, in disease, and in the abnormal states of insanity, mesmerism, and somnambulism; but without inducing conviction in his main object; since, if thought, or rather mental volition, is impossible to matter, then is the mind of brutes immaterial. We are not sure that Dr. Moore might deary this conclusion; but if it be admitted, no religious results can be deduced from immateriality. Something of the same logical defect may be visible in the practical conclusions aimed at. We all know the power of the mind; how the health and the functions of the body are controlled by it; how one passion or emotion is subdued by another more powerful. The difficulties lie in the discovery and application of the proper stimuli, so as to act not at random but by rule, and safely as well as regularly; for intense emotion may not only injure health but destroy life, as some of Dr. Moore's instances show. Proper nutriment and proper exercise are the true principles for a healthy human being, if we could but apply them; though, perhaps, the *mens sana in corpore sano* requires a good basis to proceed upon. If, however, Dr. Moore's conclusions are not altogether convincing, his book is curious, and attractive from the number of curious facts he has collected together.

PLAYING CHESS BY TELEGRAPH.—A novel and amusing game of chess was yesterday played by the electric telegraph of the South Western Railway, between Mr. Staunton at one end of the railway, and Mr. Walker, the well-known writer on chess, at the other. The players, though thus separated nearly one hundred miles apart, played, through the rapid and accurate communication afforded by the telegraph, with the greatest ease and facility. After an unusually long contest, in which both gentlemen well maintained their established repute, the game was declared to be a drawn one, each party being left with one rook and three pawns on the board.

* This duty was, on books printed previous to 1801, 17. per cwt.; on those printed after, 51. By the new tariff of 1843, the latter item is reduced to 21. 10s. per cwt.

From Fraser's Magazine.

RHYMES OF THE SCOTTISH HIGHLANDS.

I.

THE HAUNTED TARN ON THE MOOR.

THERE lies a lonely mountain tarn
On Albyn's wildest ground,
Scarce known but to the heather bee
On homeward errand bound,
Or to the wearied shepherd boy
Who seeks his charge around.

It is a solitary moor,
Girt by a giant band
Schihallion throned, like Jove on high,
With his thunders in his hand;
While a hundred lesser mighty ones
In glory 'neath him stand.

From either side, below the tarn,
Two vales together blend;
Loch Tummel and Loch Rannoch stretch
Their arms from end to end;
Down to their margins from the steep
The yellow birches bend.

Hamlets and wooded knolls are there,
And fields of plummy grain,
And troops of happy villagers
Work busy in the plain;
But tillage on this mountain moor
Were all bestowed in vain.

No plough has torn its clotted moss,
No foliage waves in sight,
Save one dark clump of ragged pines
On a small barren height—
A fearful place it were to pass
On a gusty winter night!

A tale is told of battle fought
'Twixt clans a feud that bare:
The Robertsons, by Stewarts chased
From Rannoch's forest lair,
Turned by the lonely tarn at bay,
And took them unaware.

Then had the Robertsons revenge,
Their foes were rash and few;
The waters gurgled red with blood
Their mossy basin through,
Nor was a Stewart left to tell
What hand his clansmen slew.

Down in the vale beside her fire,
The wife of one there slain
Sang to the babe was at her breast
That could not sleep for pain;
When, hush! a sound is at her door
Of neither wind nor rain.

Nor sound of foot, though shape of man,
Pale, shadowy, blood-defiled,
Withouten latch or turn of hinge
Stood by her and her child,
Then glided back with hand outstretch'd
Towards the gloomy wild.

She sprang and call'd her sister dear,
A maiden fresh and young,
"I pray thee tend my little child,
I shall be back ere long;
I fear me lest the Robertsons
Have done my husband wrong."

She kissed the babe whose downy limbs
Lay folded in her breast,
She gave it to her sister's charge
From its maternal nest;
Then, with her plaid about her clasp'd,
Unto the moorland press'd.

The shadowy wraith beside her stood
Soon as she closed the door,
And, as she pass'd by kirk and wood,
Still flitted on before,
Guiding her steps across the burn,
Up, up, unto the moor.

The moon was hid in weeds of white,
The night was damp and cold,
The wanderer stumbled in the moss,
Bewildered on the wold,
Till suddenly the clouds were rent,
The tarn before her roll'd.

The heather with strange burdens swell'd—
On every tuft a corse,
On every stunted juniper,
On every faded gorse;
The woman sank, and on her lids
Her weak hands press'd with force.

Again she was constrain'd to gaze,—
Lo! on each dead man's brow,
A tongue of flame burn'd steadily,
Though there was breeze enow
To shake the pines that overhead
Waved black, funereal bough.

And, dancing on the sullen loch,
A ghostly troop there went,
Whose airy figures floated high
On the thin element;
And grimly at each other's forms
Their mock claymores they bent.

One brush'd so near, she turn'd her gaze,
She stood transfix'd to stone;
It was the face of him she sought,
Close pressing on her own,
And fell upon her straining ear
One deep and awful moan.

She started back with madden'd shriek—
Shriek echoed by the dead;
She gave a hurried pray'r to heaven,
Then o'er the moorland fled;
Until she reach'd the village kirk,
She dared not turn her head.

Not long her thread of life endured,
Not long her infant hung
Upon that bosom terror-dried,
That mouth no more that sung.
She died, and ever since the tarn
Is shunn'd by old and young.

For still the gusty breezes raise
The phantom's anguish'd cry,
Still on the water's brim they flit
When winter storms are high;
Still flames, nor wind nor wave can quench,
Are ever burning nigh.

Nay, if you doubt it, wend your way,
In twilight's deepening blue,
And watch beneath those spectral pines—
One stormy midnight through;
And, if your courage fail you not,
You shall behold them too!

II.

CULLODEN.

There was tempest on the waters, there was
darkness on the earth,
When a single Danish schooner struggled up the
Moray Firth;
Far and grim the Ross-shire mountains loom'd
Unfriendly on its track,
Shriek'd the wind along their gorges like a suf-
ferer on the rack,
And the utmost deeps were shaken by the stun-
ning thunder-peal,—
'T was a sturdy hand, I trow ye, that was needed
at the wheel!

Though the billows flew about them till the mast
was hid in spray,
Though the timbers strain'd beneath them, still
they bore upon their way,
Till they reached a fisher village, where the ves-
sel they could moor;
Every head was on its pillow when they landed on
the shore,
And a man of noble presence bade the crew,
"Wait here for me;
I will come back in the morning, when the sun
has left the sea."

He was yet in manly vigor, though his lips were
ashen white;
On his brow were early furrows, in his eyes a
clouded light;
Firm his step withal, and hasty, through the
blinding mist so sure,
'That he found himself by dawning on a wide and
barren muir,
'Only marked by dykes and heather, bare alike of
house and wood,
But he knew the purple ridges—'t was Culloden
where he stood!

He had known it well aforetime, not as now, so
drear and quiet;
'Then astir with battle's horror, drunken with
destruction's riot;
Now so peaceful and unconscious, that the or-
phan'd and exiled
Was unmann'd to see its calmness, weeping
weakly as a child:
And a thought arose of madness, and his hand
was on his sword,
But he crush'd the coward impulse, and he spoke
the bitter word:

"I am here, O sons of Scotland, ye who perish'd
for your king;
In the misty wreaths before me I can see your
tartans swing;
I can hear your slogan, comrades, who to Saxon
never knelt,—
Oh, that I had died among ye with the fortunes
of the Celt!

"There he rode, our princely warrior, and his
features wore the same
Pallid shape of deep foreboding as the First one
of his name,—
Ay, as gloomy was his sunset, though no Scot his
life betray'd,
Better plunge in bloody glory, than go down in
shame and shade.

"Stormy hills, did ye protect him, that o'erlook
Culloden's plain,

Dabbled with the heather blossoms, red as life-
drops of the slain!
Did ye hide your hunted children from the ven-
geance of the foe,
Did ye rally back the flying for one last despair-
ing blow!
No! the Saxon holds dominion, and the humbled
clans obey,
And their bones must rot in exile who disdain
usurpers' away.

"He is sunk in wine's oblivion, for whom High-
land blood was shed,
Him the kerns most wretched sheltered with a
price upon his head;
Beaten down like hounds by whipping, crouch we
from our master's sight;
And I tread my native mountains like a robber in
the night;
Spite of tempest, spite of danger, hostile man and
hostile sea,
Gory field of sad Culloden, I have come to look on
thee!"

So he plucked a tuft of heather that was blooming
at his foot,
That was nourished by dead kinsmen and their
bones were at its root;
With a sigh he took the blossom, striding quickly
to the strand,
Where the Danish crew awaited 'mong a curious
fisher band;
Brief his parley, swift his sailing with the tide,
and ne'er again
Saw the Moray Firth that stranger or the schooner
of the Dane.

III.

THE BALLAD OF EVAN DRU.

As swarming bees upon the wing,
The people crowded o'er the hill;
And now the bell had ceased to ring,
The village kirk had ceased to fill.

The mountain burn that washed the graves
Murmured a hymn while running by;
And with the solemn chime of waves
A hundred voices clomb the sky.

The sunbeams through the open door
Came streaming in across the place,
And, messengers of gladness, bore
Heaven's radiance to each humble face.

On upturned foreheads, sage and good,
They lingered with seraphic smile,
When in the darkened doorway stood
A stranger man, and paused awhile.

His raiment had a foreign air,
His brow was burnt by foreign skies;
And there was fierceness in his stare
That suited ill devotion's eyes.

He looked around with changing cheek,
Then hurried to the nearest pew,
As one whose heart, too full to speak,
Those time-worn stairs and benches knew

The preacher eyed him as he went,
Remembrance on his features shone;
His pleading waxed more eloquent,
A warmer pity fired his tone.

"Why will ye die who know full well
Your sentence just, our warning true!
The Lord our God is terrible,
And yet the Lord hath bled for you!

"Whate'er your weakness, e'er your guilt,
His fountains wash the blackest crime;
Ah! not in vain his blood was spilt!
Turn, sinners, in th' Accepted Time!"

The stranger stirred, as ill at ease,
And shunned the preacher's earnest gaze;
When, strong as wind that shakes the trees,
Up swelled the stately Paraphrase:

"As long as life its term extends
Hope's blest dominion never ends;
For, while the lamp holds on to burn,
The greatest sinner may return."

From lisping child and tuneful girl
The glorious measure rolled on high;
Ah, Evan Dhu, the battle's whirl
Ne'er sent such dimness to thine eye!

Oft on the lawless Spanish main,
When pirate colors shamed thy mast,
The voice of that reproving strain
At midnight o'er thy slumbers passed!

Oft heaving on the southern swell,
A thousand watery leagues from land,
Thy village kirk's familiar bell
Rang through the stillness, close at hand.

"Hope's blest dominion!" for those years,
Thy reckless youth, thy hardened prime!
The stricken wretch arose in tears,
And fled as from pursuing crime.

The hymn sank down, the singers' eyes
Each other sought in wondering dread,
Until an old man spake, with sighs,
"My son is living who was dead!"

"Yes, 't is the son whom I have wept
As false to God, and lost to me;
But he whose hand the wanderer kept,
Will set the slave of Satan free."

With tears upon his visage old,
The trembling father sought his son,
Who, flung upon the heathy mould,
Embraced his mother's burial-stone.

A woman sat beside the tomb;
Her youth was fled, her eyes were dim;
For she had lived away her bloom
In agonizing thoughts of him.

Ah, Evan Dhu! beloved of yore,
Thy wooing met no coy denial;
But pleasure gilt a foreign shore,
And she was left to faith and trial!

Thou, all unworthy of her love,
Debased thy heart to low desires;
She was a star that watched above
The marshes' false, uncertain fires.

Long watched, long waited, till, at last,
Her soul was from its anchor driven;
And reason was by love o'ercoast,
And every link of memory riven.

With inexpressive sweetness smil'd
Her eyes, that knew not friend from friend,
While, harmless as a gentle child,
Her daily steps would church-ward tend.

Ah, Evan Dhu! beside thee sat
This idol of thy boy romance;
Ah, Evan Dhu! return'd too late
To wilder'd brain and vacant glance!

She knew him not, but chanted low
An ancient lay of love and sorrow,
And aye its sad returning flow
Was "Smile to-day, grief comes to-morrow."

But many years were yet for him,
A penitent, heart-broken man,
To drain a cup that o'er the brim
With bitter juice of memory ran—

Long years for him to tend the maid,
Whose restless eyes still turn'd away,
Who spoke his name but to upbraid
With tender plaints the Far-away.

Dire was his penance, by her side,
To mark the wreck, to feel the shame,
She never knew him, though she died
Calling on his beloved name.

IV.

THE OLD HOUSE OF URRARD.

Dost fear the grim brown twilight?
Dost care to walk alone
When the firs upon the hill-top
With human voices moan!
When the river in his channel
Doth twist through craggy linn,
Like one who cannot sleep o' nights
For evil thoughts within!
When the hooting owls are silent
The ghostly sounds to hark
In the ancient house of Urrard,
When the night is still and dark!

There are graves about old Urrard,
Huge mounds by rock and tree,
And they who lie beneath them
Died fighting by Dundee.
Far down along the valley,
And up along the hill,
The fight of Killiecrankie
Has left a story still;
But thickest show the traces,
And thickest throng the sprites,
In the woods about old Urrard
On the gloomy winter nights.

In the garden of old Urrard,
Among the bosky yews,
Upstairs a turf hillock,
Refresh'd by faithful dew;
Here died the Highland captain,
By charmed silver ball,
And all the might of victory
Dropp'd nerveless in his fall;
Last hope of exiled Stuart—
Last heir of chivalrie—
In the garden of old Urrard
He fell, the great Dundee!

In the ancient house of Urrard
There's many a hiding den—

The very walls are hollow
 To succor flying men ;
 For not e'en lady's chamber
 Barr'd out the fierce affray,
 And couch and silken hainging
 Were stain'd with blood that day :
 From yonder secret passage
 Hack'd sword, and skull, and bone,
 Were brought to light in Urrard,
 When years had pass'd and gone.

If thou sleep alone in Urrard,
 Perchance in midnight gloom
 Thou'lt hear behind the wainscot
 Of that old haunted room
 A fleshless hand that knocketh,
 A wail that cries on thee,
 And rattling limbs that struggle
 To break out and be free.
 It is a thought of horror,
 I would not sleep alone
 In the haunted rooms of Urrard,
 Where evil deeds were done.

Up in the dusty garrets,
 That stretch along the roof,
 Stand chests of ancient garments,
 Of gold and silken woof.
 When men are lock'd in slumber
 The rustling sounds are heard
 Of dainty ladies' dresses,
 Of laugh and whisper'd word,
 Of waving wind of feathers,
 And steps of dancing feet,
 In the garrets of old Urrard,
 Where the winds of winter beat.

By the ancient house of Urrard
 Its warder mountain sits ;
 Whene'er those sounds arouse him
 His cloudy brow he knits ;
 For he the feast remembers,
 Remembers too the fray,
 And to him flee the spectres
 At breaking of the day.
 There under mossy lichen
 They couch with hare and fox,
 Near the ancient house of Urrard,
 'Mong Ben-y-Vrachy's rocks.

E. A. H. O.

From Hood's Magazine.

MOLOCH, OR THE SONG OF THE FURNACE.

BY EDWARD JOHN SELWYN.

"The Fire that saith not, 'It is enough.'"
 Prov. xxx. 16.

HEAP on the coal ! my masters !
 Stint not the food I love ;
 I need no banquet-tasters,
 Its wholesomeness to prove.
 Heap on ! with hand unsparing,
 And scuttle and shovel light :
 I'll sing ye songs worth hearing !
 Deem ye me dumb to-night ?
 Mine is a mirthful story,
 Though haply sad to you—
 Say, would ye wot of glory ?
 Then list—my tale is true !

Whilom, this spot was meadow,
 Where now I roar at night ;
 O'er the greensward, sun and shadow
 Danc'd in succession bright.

Here came the gay fawn, bounding
 Its dappled dam to greet ;
 Heard they my rude roar sounding,
 Methinks their hoof were fleet.
 Here rose the lark at morning,
 The blythe thrush warbled here ;
 Saw they my black throat yawning,
 They'd tumble in with fear !
 Hither came Youth and Beauty,
 Light steps and laughter gay ;
 Methinks her face were sooty,
 Who gaz'd too near to-day.
 But lo ! with axe on shoulder,
 The skilful artisan—
 Surely, there is none bolder
 Than that strange creature, man—
 He came, and hew'd the forest—
 He dug beneath the soil—
 His toil was of the sorest,
 Yet he reck'd not of his toil.
 Daily and nightly—deeper
 Beneath the earth he div'd—
 Woe ! to the ling'ring sleeper !
 Woe ! to the newly-wiv'd.
 Why bor'st thou, thou that borest !
 Delver, why delv'st thou so !
 Above ye grew the forest—
 Seek ye fresh groves below !
 They had hewn wood in the meadow,
 They found more wood below ;
 For beneath that pit's dark shadow,
 Thick trunk on trunk did grow.
 'T was coal, they said—rich treasure !
 And, faith, right glad were they.
 They found great store—"No measure
 Can mete it out," they say.
 Coal ! 't is the diamond's brother !
 Strange speech, I ween, yet true ;
 Of one substance and one mother,
 Diverse enough their hue !
 This coal I feed on nightly—
 Coal, I devour by day :—
 Heap, heap on ! the more brightly
 I burn, the more I'll say.
 And lo ! in other places
 They delv'd beneath the sod,
 And cheer'd grew their faces,
 And with lighter step they trod.
 "Ho ! ho ! black iron," they shouted,
 "Great luck is ours to-day !"
 They laughed. "What dullard doubted
 There was treasure in this clay !
 Erewhile, men said, earth riches
 Wave with the golden corn ;
 Our darksome pits and ditches
 The cravens laugh'd to scorn.
 Say, will they laugh, when, clashing
 Farmer with artisan,
 In banded conflict dashing
 Black iron against red grain
 Shall fill the world with anguish,
 Tumult, and wild dismay,
 Till the grim ore shall vanquish
 Grain's bonded knavery !"
 Then took they brick, and daily
 Made me more tall and strong—
 (Ye must ply my fire more gaily,
 An ye would hear my song.)
 Then took they fire, and taught me
 On all that burns to feed :
 I ate up all they brought me,
 Nor knew I ought of need.
 Days, nights, weeks, months, yea longer,

Than one of you can tell,
 Stronger I've wax'd and stronger,
 As I remember well.
 From out the earth's dark treasure,
 They've brought me coal for food:
 How my black jaws glow with pleasure,
 When I roar my thanks, "'T is good!"
 From out the earth's cold bosom,
 They've brought the hard black ore:
 It has withered like some blossom
 My scorching blast before.
 I've laugh'd and gleam'd, how brightly!
 To see the white stream glow,
 When the tanks are open'd nightly,
 That the molten flood may flow.
 But louder far my laughter,
 When they hurl in coal and ore:
 Should he who hurls fall after,
 He never stints me more.
 But draw ye somewhat nearer;
 I've a little tale to tell:
 'T will somewhat thrill the hearer,
 But ye may bear it well.
 So heap the fuel—ay, faster—
 I hunger. Telling tales
 Is hung'ring work, good master;
 The hungry memory fails.
 If ye would hear my story,
 Then feed me—aa ye may—
 Ye know not what's before ye,
 If your feeding hand ye stay.

'T is long ago—I heed not
 How long the time may be—
 There liv'd a maid—ye read not
 Of a lovelier maid than she.
 Though humbly faring, healthy;
 With earth's lore ill endow'd:
 In every good gift wealthy,
 In conscious virtue proud.
 Years brought at length a lover,
 Her maiden heart to prove;
 (I'd be last one to reprove her,
 But I know not what is love.)
 He lov'd her well—and pleaded
 As a lover only can:
 Provision small they needed,
 Blest woman with blest man!
 He wed her, and she bore him
 One lovely child—men tell:
 But woe was hanging o'er him—
 'T was winter—wages fell—
 And work grew scarcer daily—
 And his heart sank cold within—
 His eye's bright fire wan'd palely,
 And his frame grew weak and thin.
 Yet he toil'd on, though labor
 Grew cheaper, day by day;
 Till each whisper'd to his neighbor,
 "Where get we bread, I pray!"
 Yet did that lovely maiden,
 Because her love was strong,
 Pale, hung'ring, sorrow-laden,
 Endure in silence long.
 At length, one day, he left her,
 Yet not in wrath but love:
 Ne'er had he thus bereft her,
 Save for her weal to rove.
 "For," said he, "while I linger,
 Wages more scarce become;
 By search, 'chance, I may bring her
 To some more prosp'rous home."
 He went, and long he wander'd—

And sought—but all in vain;
 "Woe! woe!" whene'er he ponder'd,
 On his return again.
 Meanwhile he sicken'd—sorrow
 Had wrought on him full sore.
 Sad each day—sad each morrow—
 Hopeless his evermore.
 He died—heart broken. Sadness
 Had laid the husband low—
 Grief wrought the wife to madness,
 (At least men deemed it so.)
 For one night, when the curtain
 Of darkness veiled the sky,
 She heard a voice uncertain,
 A long, low, dismal cry—
 "'T was the furnace wrought this sorrow—
 Let the furnace have his fill—
 Thy dearest—e'er to-morrow—
 Else'"—then the voice was still!
 She listen'd—'t was repeated—
 And thrice she heard the same—
 Till each madden'd sense was cheated,
 And her brain seem'd all on flame.
 From her humble couch she started,
 And along the path she sprung—
 Unclad—her hair, loose-parted,
 To the chill night-breeze she flung—
 And in her arms, half-waken'd,
 Her shiv'ring child she bore,
 To where my tall form blacken'd,
 To my glare, and smoke, and roar.
 "My child," she cried, "what ail'st thou?
 Is the night dark and chill!
 Haply from terror quail'st thou
 That I shall work thee ill!
 Hush thee, my child—grim voices
 Have call'd us, and we go;
 Yea, my sad heart rejoices
 To have been summon'd so.
 Soon will thy father greet thee,
 Thy father, lost so long!
 With his own kind smile he'll meet thee—
 Fear'st thou he'll do thee wrong?
 No, my child—warm is the pillow
 Where thou shalt lay thy head;
 Whelm'd 'neath yon fiery billow
 Thou'lt pine no more for bread.
 And I, too, soon shall follow—
 Without thee, what were I?
 Hear'st thou again that hollow—
 Ah me!—that dismal cry!
 Then clasp thee closer, dearest!
 Hush thee! 't will soon be o'er!
 Fear not—I know thou fearest
 Thou wilt never see me more.
 Nay—my love—where thou goest
 I straight shall follow too:
 How small a part thou knowest
 Of what I go to do!
 Farewell! farewell! one instant—
 And we shall meet again.
 Thou'lt fare better there, sweet infant:
 One pang—then no more pain!"
 Once and again she kiss'd him—
 Sure, since the babe saw light,
 Sweeter kiss ne'er had bless'd him,
 Than she gave that dismal night.
 Then once again—then leapt she
 Where ye hurl in the ore—
 There she hurl'd him—nor wept she
 That she ne'er should meet him more.
 Nay—had she wept, I reckon
 Her tears had soon been dry,

For surely, ne'er war-beacon,
 Flam'd half so fierce as I.
 It had done ye good, to have listen'd
 How the child's flesh crack'd and fizz'd,
 And seen how my fierce eyes glisten'd,
 And the wild sparks round it whizz'd.
 She mark'd it all—and screaming
 Asked, "Hast thou now thy fill?
 Sure 't was thou call'dst—no dreaming
 Had wrought me half this ill;
 But since thou hast the baby,
 Take now the wife as well:
 Thou lov'st rich food—and may be,
 Much of it: who can tell?"
 Then down the op'ning hollow,
 With a rending shriek, and wild,
 She sprang, right glad to follow,
 Where she had hurl'd her child.
 Thus, I had slain the father—
 For I caus'd his want of bread.
 But I knew he would die rather,
 In his wife's and infant's stead;
 So I call'd the mother to me,
 And bade her burn the child;
 Now which of ye can show me
 Mirth half so gay and wild?
 And, but that ye've been filling
 My throat with what I lov'd,
 While I my tale was telling,
 Ye too my mirth had prov'd.
 Now each good sprite that hovers,
 Would ye do me a good turn,
 Send me plenty of young lovers,
 To wed, and starve, and burn.

From the New York Churchman.

Plato against the Atheists; or the Tenth Book of the Dialogue on Laws, accompanied with critical notes, and followed by extended dissertations on some of the main points of the Platonic Philosophy and Theology, especially as compared with the Holy Scriptures. By TAYLER LEWIS, LL. D., Professor of the Greek Language and Literature in the University of the City of New York. New York: Harper and Brothers. 1845.

It is with us an axiom that no reconstruction of our philosophical systems, (not to say ethical and political,) will to any extent deserve success, which is not thoroughly pervaded with the Platonic spirit. For this reason we are glad to see an awakening interest taken in the study of Plato, and facilities afforded thereto by such editions of parts of his writings as will best meet the wants of our scholars. Little, however, had been done of which we are aware, till an edition of the *Gorgias*, by Professor Woolsey of Yale College, appeared in 1842, than which, by the way let us remark, no one edition of any classic has ever appeared in this country better fitted for a text-book in universities. That, however, *did* aim at being a text-book, and by its clear analytical introduction as well as its accurately critical annotations, has laid us under a deep sense of its value as a means of providing some knowledge of the text of Plato. Professor Lewis' volume is of a different kind; his aim has been to make it a text-book not so much of the Greek language as of Platonic philosophy, a starting point for his various excursions into regions of thought now seldom visited. Why he deems such investigations important will be best stated in his own language:—

"We believe that in this age there is a peculiar call for a deeper knowledge of Plato. Some acquaintance with his doctrine of ideas seems needed as a corrective to the tendency, so widely prevalent, to resolve all knowledge into an experimental induction of facts, not only in physical, but also in ethical and political science. If the Good, to adopt our author's own style, is something more than pleasure or happiness, either present or anticipated—if the True is something higher than past, present or future facts—if the Beautiful is something more than a generalization from pleasing individual sensations—if the Just and the Right involve inquiries far above those endless logomachies and questions of casuistry which form the main features of modern ethics—if the State is a reality transcending a present aggregation of flowing and perishing individuals—if Law is a spiritual power distinct from the muscular force of a majority of present wills—if God is something more than gravitation, or the eternal development of a physical fate, which is only another name for an eternal succession of inexplicable phenomena—if there is a real foundation for the *moral* and religious, as distinct from, and not embraced in, the *natural*; or, in other words, if penalty and retribution are terms of far more solemn import than the modern jargon about physical consequences—then surely is it high time that there should be some disturbance of this placid taking for granted of the opposing views; then surely should Plato be studied, if for no other purpose, as a matter of curiosity, to see if there may not possibly be some other philosophy that this noisy Baconianism, about which there is kept up such an everlasting din, or that still more noisy because more empty transcendentalism, which some would present as its only antidote. In place of all this, we want the clear, simple, *common sense* philosophy of Plato, commending itself, when rightly understood, to all the *zoiai* *tyvota*, or universal ideas of the race, in distinction from that miscalled *common sense* which is only the manufactured public opinion of the moment—a philosophy most religious—most speculative and yet most practical—most childlike in its primeval simplicity, and yet most profound. We speak with confidence on this point. The young man who is an enthusiastic student of Plato can never be a sciolist in regard to education, a quack in literature, a demagogue in politics, or an infidel in religion."—*Introduction*, pages 11–13.

With such earnestness and vigor we feel sure that the task which has been undertaken cannot fail of enlisting the warm admiration and approbation of those who long for some higher system of philosophy than those prevalent. Especially will the unsparing attacks made on those pursuits dignified by the name of Natural Philosophy, meet the yearnings of those whose sentiments of reverence for God cannot away with the theories by which "imponderable agents" are virtually substituted for the Providence which governs all things, the Being who is essential (not wisdom merely, but) goodness, mercy and truth relieved of these attributes one after the other till nothing is left but a simple intelligence, and which in effect would substitute for Him in whom we live, move, and have our being, a principle more sluggish and unconcerned than the gods of Epicurus. That to some such conclusion as to our present state all will come who fairly survey the tendencies and developments of modern science, we cannot doubt.

With a subtle semi-atheism influencing our learned men and a bold rationalizing indifference leavening the conceit of half-learned men, while practical immorality issues in the lower classes, it is surely time that a higher standard were set for all ranks.

But we have no wish to inflict any more of our own ideas on these points upon our readers. Our pen will be better employed, and their time more profitably spent, in some account of the work before us. It opens with an enthusiastic introduction, of which we have given a specimen. Then follows the statement of the argument, and next to it the Greek text, accompanied by critical and explanatory notes. References to the more extended notes and dissertations occur here, which occupy the rest of the volume. It is here, that Professor Lewis has put forth his strength, discussing fully every point connected with the text, the main object being the same with Cudworth's well known work, viz., the confutation of atheism. The dissertations are seventy-five in number, and abound in most apposite illustrations from the other Platonic writings. To give any idea by way of abstract of the contents of these dissertations is utterly out of our power: their compactness denying further compression. One or two features we may notice, and conclude with an extract from the 34th excursus.

In excursus the 60th we find Professor Lewis almost adopting the view of those who have thought Plato in some sense under Divine guidance in his writings, but on the whole adopting a more enlarged and philosophical theory, for which we refer to the volume. Again: in more than one place expressions are used which will do anything but conciliate the favor of geologists and physical inquirers in general. But this we imagine will give the author but little concern. The extract which we give needs no exponent of its meaning. After one or two explanations of the way in which Plato's doctrine of θεοὶ was consistent with his belief in the Divine Unity he thus continues:—

"We may even go still further in our apology, and maintain that if he did hold that the heavenly bodies were animated, or that they were severally under the care of distinct spirits, there was, in the latter opinion at least, no serious error even when viewed in the light of revelation itself. The Bible not obscurely teaches that the personal destinies of individual men are, in a measure, under the direction and guardianship of supernatural beings. Churches are said to have their guardian angels according to Rev. ii. 1, which we prefer to take in this literal sense, rather than to adopt any other interpretation which has been forced upon it in the controversy respecting ecclesiastical government. The same doctrine is pretty clearly intimated in respect to nations, Daniel x. 20, 21, where Greece and Persia are said each to have their invisible champion, whether of a good or evil nature. There is also a remarkable passage, Deuteronomy, xxxii. 8, which, if taken according to the Septuagint version, would directly establish the same doctrine. 'When the Most High divided the nations, when he separated the sons of Adam, he appointed the bounds of the people according to the number of the children of Israel,' as it is in the Hebrew, but, 'according to the number of the angels of God,' κατὰ ἀριθμὸν ἀγγέλων θεοῦ, as it stands in the Greek of the Septuagint. We cannot account for the difference, but it certainly

seems as though the Greek version was more consonant with the context which follows, and which asserts that 'Israel is the Lord's peculiar inheritance,' in distinction from the other nations which seem to have been left to the subordinate care of other directing powers. This very passage, too, it should be remarked, is quoted by Eusebius, *Præp. Evang.* xi. 26, to prove that Plato obtained his doctrine of the δαίμονες from Moses. That such an idea prevailed among the heathen nations, especially the Persians, is evident from Herodotus vii. 53, θεοὶ τοὶ Παρσίδαι γῆν ἐκλόγχασι.

"The Bible teaches us also that even the ordinary causes of physical events are under the controlling agency of angelic beings. 'He maketh his angels winds, his ministers a flaming fire;' as the author of the Epistle to the Hebrews renders it. Science with all its modern boasting can affirm nothing in opposition to this. It is a view which interferes not at all with the regularity and the apparent laws of physical phenomena, and, as we have seen, the Bible quite plainly reveals it. Nay more, may there not be found some countenance then to this very doctrine of Plato? If individuals and churches and nations and every department in nature have their presiding invisible powers, why not the heavenly bodies, why not an angel of the sun, of the moon and of each planet? Did the ancient Hebrew writers mean only physical instead of psychical powers, when they spoke of the *Hosts of Heaven*, and used that most sublime epithet, *Jehovah Tsebaoth*, or *Lord of Hosts*? The Septuagint, by rendering it κτίσις δυνάμεων, have seemed to refer it to physical rather than spiritual agencies;* but it is a serious question whether much more than this is not contained in the Hebrew. Was it simply a sublime personification when it was said, 'He bringeth out their host by number; he calleth them all by name?' or when we are told that, at the creation of our earth, 'the stars of the morning sang together, and all the sons of God shouted for joy?' We have no hesitation in preferring this, extravagant as it may appear, to that modern extreme which would leave such an immense unanimated solitude between man and the Deity, instead of filling it up as the old Patristic theology did, with δαίμονες, angels, thrones, dominions, principalities, and powers:—

With helmed Cherubim
And sworded Seraphim,

and all that array of invisible beings whose existence the Bible does seem to take for granted, although some in former times may have carried it to an extravagant extent.

"Surely we may still maintain the precious Protestant doctrine, that no one but the Supreme Lord of Hosts is entitled to any the least species of religious adoration, and yet believe in many an order of being, which, although of far higher rank, yet constitute, with man, an immense brotherhood of created intelligences, all intended for the manifestation of the glory of Him, by whom, and for whom, all things were created whether visible or invisible, whether in the earth or in the heavens. There is some reason to fear that Protestants, under the guise of a hyperspirituality, have gone too

* We cannot see that δυνάμις is any more unfavorable to the idea of spiritual agencies than the corresponding Hebrew word; certainly there are passages which are more favorable to these than to physical, e. g. Tob. i. 6, Rom. i. 20, and many others.

far in the opposite direction to what is really a materializing and physical hypothesis. When we discover a disposition to banish in our minds all intermediate spiritual agencies, and, by magnifying natural causes, to place the Deity at the most remote distance possible, it does really seem as though, if we could or durst, we would dispense with *His* presence also in the regulation of the universe. In all ages, a tendency to that Sadducism which barely saves the doctrine of the soul's existence in another state, has been held, and justly held, to be near of kin to infidelity, if not to downright atheism. Far better to believe too much on this subject than too little, even if we cannot agree, with Plato, that there is a presiding spiritual superintendence assigned to each celestial body." Pages 231—3.

We must close our notice of this work; one which we regard as perhaps the most valuable accession to the cause of learning and religion combined which our country has produced. We earnestly hope that it may be introduced into all colleges and seminaries where Christianity is professed as a basis of education.

It remains but to add that the publishers have risen with the value of the publication so far as mechanical execution is concerned. The volume is one of the neatest ever issued from their press and the typography correct.

THE NEW GLASS MOSAICS.

Mr. DICKSEE has exhibited specimens at the soirées of most of the scientific institutions of the metropolis of his patent mosaics, which have likewise been approved by the royal commission on fine arts; and as mosaic decorations are becoming so popular, in consequence of the attention bestowed upon the subject by the royal commission on fine arts, some notice of this new and beautiful description of mosaic will be interesting.

The material employed is glass, and the method of producing the tessere is by a process of moulding by pressure. For this purpose a small machine is used, from which the tessere are produced of all shapes and sizes, perfectly formed, at a rapid rate and trifling cost.

The superiority of glass to pottery, and all substances used for mosaic purposes, has been universally admitted; but the immense cost of its manufacture into the required forms by the old methods has prevented its universal adoption.

Glass, as a material, is cheap; and the patentee is of opinion that when the duty is removed, he will be able to compete with pottery in price.

Glass excels all other materials employed for mosaic purposes, inasmuch as it can be obtained of any color, or tone of color, to suit the light in which it is to be used. It is imperishable, and will never corrode. It may be used with the fire polish natural to it, or the surface may be dulled or polished. Should the surface get scratched, the dirt will easily wash out;—such is not the case with porcelain or marble.

It combines all the effects that can be produced in all other mosaic materials; and the most costly marbles, pebbles, &c., are imitated with precision, and at no more cost than the plain colors. These imitations, when formed into slabs for table-tops, &c., have a most beautiful effect. Another description, which is applicable to mural decorations,

is that with figures pressed upon the surface, the figures may be of different color to the ground, and the surface may be coated with transparent glass, to make it even, and preserve the figures from dust.—*Polytechnic Review*.

PUNCH IN THE COUNTRY.—At this delightful season of the year, the aspect of nature, in her rustic guise, is peculiarly suggestive to the London mind of home associations. The lark warbling aloft, reminds us of Grisi; the lamb, skipping in the meadows, of Cerito; the bright blue sky, of that uniform which is worn by the guardians of the public peace. Analogy connects the light breeze with the street squabble, and the mist of the valley with that fog which forms the largest element of our native atmosphere. The verdant fields bid us think of those green ones whose innocence is the dupe of the quack and the swindler: the woods, of that pavement now laid down in our principal thoroughfares. The sparkling rill takes us to Trafalgar Square and its fountains; the rustic garden to that of Covent. The sunlight, turned on in its glory, awakens thoughts of gas, with especial reference to the Bude Light; and the whole joyous countenance of Dame Nature recalls us to those laughs which explode around the festive board at the joke of the humorist.

THE MYSTERY OF MEDICINE.

We perceive that Mr. Muntz has given notice of a motion requiring all medical practitioners to write their prescriptions in English, and to put plain English on their gallipots. If this proposal is adopted, the dignity of medicine is gone, for on the principle of *omne ignotum pro magno*, people fancy that a prescription must do them a wonderful deal of good if they cannot understand the meaning of it. Who will have any faith in medicine when he knows the ingredients!

There is something mysterious in *Duo pilluh facti cum pane*, but when we come to know that it means nothing more than "two bread pills," the senses revolt against the idea of deriving any benefit from taking them. Besides, when a medical man is in a hurry, and does not know exactly what to prescribe, he can always with safety scribble down *Aq.—Coleh.—pan.—Sen.—Mag.—Cort.*, and the apothecary, if he has any tact, will send in something harmless, with directions—at his own discretion—about the mode and period of taking it.

But if all prescriptions are to be in English, what on earth is a medical man to do when he wants to prescribe nothing at all, but a dose quite at the discretion of the chemist. We knew a facetious general practitioner who used to jot down *quod—plac—mi—form—car*, which looked very well in abbreviated Latin, but which was in short—or rather in full—*quodcumque places, mi formose care*—(whatever you please, my pretty dear;) a prescription the chemist always understood to mean water with a dash of senna in it, to be taken at bed-time. We entreat Mr. Muntz to pause before he strips medicine of that mystery which gives it half its importance in the eyes of the multitude. As to anglicizing the gallipots we defy the best linguist on earth to translate into English those mystic syllables which are painted at random with a view to variety, and without the remotest attempt at meaning.—*Punch*.

From the Edinburgh Review.

Gregoire VII. ; St. François d'Assise, St. Thomas D'Aquin. Par E. J. Delécluze. Two volumes. 8vo. Paris: 1844.

He had been a shrewd, if not a very reverent observer of human life, who bowed to the fallen statue of Jupiter, by way of bespeaking the favor of the god in the event of his again being lifted on his pedestal. Hildebrand, the very impersonation of papal arrogance and of spiritual despotism, (such had long been his historical character,) is once more raised up for the homage of the faithful. Dr. Arnold vindicates his memory. M. Guizot hails him as the Czar Peter of the Church. Mr. Voight, a professor at Halle, celebrates him as the foremost and the most faultless of heroes. Mr. Bowden, an Oxford Catholic, reproduces the substance of Mr. Voight's eulogy, though without the fire which warms, or the light which irradiates, the pages of his guide. M. Delécluze, and the *Bibliothèque Universelle de Genève*, are elevated by the theme into the region where rhetoric and poetry are conterminous; while M. l'Abbé Jager absolutely shouts with exultation, to witness the subsidence, at the voice of Protestants, of those mists which had so long obscured the glory of him, by whom the pontifical tiara was exalted far above the crowns of every earthly potentate. Wholly inadequate as are our necessary limits to the completion of such an inquiry, we would fain explore the grounds of this revived worship, and judge how far it may be reasonable to join in offering incense at the shrine of this reinstated *Jupiter Ecclesiasticus*.

Except in the annals of Eastern despotisms, no parallel can be found for the disasters of the Papacy during the century and a half which followed the extinction of the Carolingian dynasty. Of the twenty-four popes who during that period ascended the apostolic throne, two were murdered, five were driven into exile, four were deposed, and three resigned their hazardous dignity. Some of these Vicars of Christ were raised to that awful preëminence by arms, and some by money. Two received it from the hands of princely courtisans. One was self-appointed. A well-filled purse purchased one papal abdication; the promise of a fair bride another. One of those holy fathers pilaged the treasury, fled with the spoil, returned to Rome, ejected his substitute; and mutilated him in a manner too revolting for description. In one page of this dismal history, we read of the disinterred corpse of a former pope brought before his successor to receive a retrospective sentence of deposition; and in the next we find the judge himself undergoing the same posthumous condemnation, though without the same filthy ceremonial. Of these heirs of St. Peter, one entered on his infallibility in his eighteenth year, and one before he had seen his twelfth summer. One again took to himself a coadjutor, that he might command in person such legions as Rome then sent into the field. Another, Judas like, agreed for certain pieces of silver to recognize the Patriarch of Constantinople as universal bishop. All sacred things had become venal. Crime and debauchery held revel in the Vatican; while the afflicted church, wedded at once to three husbands, (such was the language of the times,) witnessed the celebration of as many rival masses in the metropolis of Christendom. To say that the gates of hell had prevailed against the seat and centre of Catholi-

cism, would be to defy the Inquisition. But Baronius himself might be cited to prove that they had rolled back on their infernal hinges, that thence might go forth malignant spirits, commissioned to empty on her devoted head the vials of bitterness and wrath.

How, from this hotbed of corruption, the seeds of a new and prolific life derived their vegetative power, and how, in an age in which the Papacy was surrendered to the scorn and hatred of mankind, the independence of the Holy See on the imperial crown became first a practical truth, and then a hallowed theory, are problems over which we may not now linger. Suffice it to say, that in the middle of the eleventh century, Europe once more looked to Rome as the pillar and the ground of the truth; while Rome herself looked forth on a long chain of stately monasteries, rising like distant bulwarks of her power in every land which owned her spiritual rule.

Of these, Clugni was the foremost in numbers, wealth, and piety; and at Clugni, towards the end of the year 1048, a priest, arrayed in all the splendor, and attended by the retinue of a pontiff elect, demanded both the hospitality and the homage of the monks. His name was Bruno. His office, that of the Bishop of Toul. But at the nomination of the Emperor Henry the Third, and in a Germon synod, he had recently been elected to the vacant Papacy, and was now on his way to Rome, to take possession of the Chair of Peter. The prior of the house was distinguished above all his brethren by the holiness of his life, the severity of his self-discipline, and by that ardent zeal to obey which indicates the desire and the ability to command. He was then in the prime of manhood, and his countenance (if his extant portraits may be trusted) announced Hildebrand as one of those who are born to direct and subjugate the wills of ordinary men. Such a contest he achieved over him on whose brows the triple crown was then impending. An election made beyond the precincts of the Holy City, and at the bidding of a secular power, was regarded by the austere monk as a profane title to the seat once occupied by the Prince of the Apostles. At his instance, Bruno laid aside the vestments, the insignia, and the titles of the pontificate; and, pursuing his way in the humble garb of a pilgrim to the tomb of Peter, entered Rome with bare feet, and a lowly aspect, and with no attendant (or none discernible by human sense) except the adviser of this politic self-abasement. To Bruno himself indeed was revealed the presence of an angelic choir, who chanted in celestial harmonies the return of peace to the long-afflicted people of Christ. Acclamations less seraphic, but of less doubtful reality, from the Roman clergy and populace, rewarded this acknowledgment of their electoral privileges, and conferred on Leo the Ninth (as he was thenceforth designated) a new, and, as he judged, a better title to the supreme government of the church. The reward of this service was prompt and munificent. Hildebrand was raised to the rank of a cardinal, and received the offices of sub-deacon of Rome, and superintendent of the church and convent of St. Paul.

Not less assiduous to soothe, than they had been daring to provoke, the resentment of the emperor, the pope became once more a courtier and a pilgrim, while the cardinal remained in Rome to govern the city and the church. Thrice Bruno visited the German court, bringing with

him papal benedictions to Henry, and papal censures on Henry's rebellious vassals. So grateful and so effective was the aid thus rendered to the monarch, that on his last return to Italy, Leo was permitted to conduct thither a body of Imperial troops, to expel the Norman invaders of the papal territory. At Civitella, however, the axes of Humphrey and Robert, brothers of William of the Iron-hand, prevailed over the sword and the anathemas of Peter. Whether Hildebrand bore a lance in that bloody field, is debated by his biographers. But no one disputes that he more than divided the fruits of it with the conquerors. To them were conceded the three great fiefs of Calabria, Apulia, and Sicily—to the Holy See the suzerainty over them. Humiliated and broken-hearted by his defeat, Bruno pined away and died. Strong in this new feudal dominion, and in the allegiance of these warlike vassals, Hildebrand directed his prescient gaze to the distant conflicts and the coming glories in which they were to minister to him. The auspicious hour was not yet come. His self-command tranquilly abided the approach of it.

Gebhard, Bishop of Eichstadt, enjoyed the unbounded confidence and affection of Henry. He had ever lent the weight of his personal advice, and the sanction of his episcopal authority, to sustain his friend and master in his opposition to papal encroachments. Yet Gebhard was selected by the discerning cardinal, as of all men the best qualified to succeed to the vacant papacy. Presenting himself in the emperor's presence, Hildebrand implored his acquiescence in a choice in which he must perceive (such was the language of the cardinal) that his feelings, his interests, and his honor, had all been anxiously consulted. The thoughtful German detected the net spread for him by the wily Italian. He struggled to avoid it, but in vain. He suggested many other candidates. To each Hildebrand had some conclusive objection. He urged that, by the favor and the testimony of Henry himself, Gebhard, and he alone, had been raised to an eminence unassailable by reproach, and beyond the reach of suspicion. Importuned and flattered, his affections moved but his understanding unconvinced, the emperor at length yielded. If our own second Henry had studied this passage of history, the darkest page of his own had perhaps never been written.

Gebhard became pope, assumed the title of Victor the Second, adopted, even to exaggeration, the anti-imperial principles of Hildebrand, and rewarded his services by a commission to act as his legate *a latere* in the kingdom of France. By Victor, this high employment was probably designed as an honorable exile for a patron to whom he had contracted so oppressive a debt of gratitude. But the new legate was not a man on whom any dignity could fall as a mere unfruitful embellishment. He cited before him the bishops and ecclesiastical dignitaries, subjected to his legantine power, and preferred against the whole body one comprehensive charge of simony. Of the accused, one alone stoutly maintained his innocence. "Believest thou," exclaimed the judge, "that there are three persons of one substance?" "I do." "Then repeat the doxology." The task was successfully accomplished, until the prelate reached the name of him whose gifts Simon Magus had desired to purchase. That name he could not utter. The culprit cast himself at the legate's feet, confessed his guilt, and was deposed. More than eighty of

his bretheren immediately made the same acknowledgment. The rumor spread on every side, that the papal emissary was gifted with a preternatural skill to discern the presence in the human heart of any thoughts of Satanic origin. Popular applause followed the steps of the stern disciplinarian, and the wonder of the ignorant was soon rivaled by the admiration of the learned and the great. Such was the fame of his wisdom, that the claim of Ferdinand of Castile to bear the imperial title, was referred to his legantine arbitrement by the Spanish and the German sovereigns. He awarded that exclusive privilege to Henry and to his heirs. Ill had Henry divined the future. Rashly had he consented to hold the honors of his crown by the judicial sentence of a man, who, within twenty years, was to pluck that crown with every mark of infamy from the brows of his only son and successor.

When that son ascended the throne of his progenitors, and assumed the kingly title of Henry the Fourth, he was yet a child. Agnes, his widowed mother, became the regent of his dominions, and Victor the guardian of his person. But the pope soon followed the deceased emperor to the grave, and another papal election placed Frederick of Lorraine on the apostolic throne. In appearance, the choice was the undesigned and hasty result of a mere popular tumult. In reality, it was effected by the influence, as it promoted the designs, of Hildebrand.

Frederick was the brother of Godfrey, who, in right of his wife Beatrice, and during the minority of her daughter Matilda, exercised the authority and enjoyed the title of Duke of Tuscany. This promotion cemented the alliance between the Holy See and the most powerful of the Italian states, by which the northern frontier of the papal territories might be either defended or assailed. Nor were the clamor and confusion which attended it, really unpremeditated. For so flagrant a disregard of the rights of the infant emperor, some excuse was necessary, and none more specious could be found than that which was afforded by the turbulence of popular enthusiasm. By what informing spirit the rude mass had been agitated, was sufficiently disclosed by the first act of the new pontiff. He had scarcely assumed the title of Stephen the Ninth, before he conferred on Hildebrand the dignities of Cardinal-Archdeacon of Rome, and of Legate at the Imperial court.

After a reign of eight months, Stephen, conscious of the approach of death, left to the Romans his last injunction to postpone the choice of his successor, until the return from Germany of this great dispenser of ecclesiastical promotions. The command was obeyed. The cardinal-archdeacon reappeared, bringing with him the consent of the empress-regent to the choice of Gerard, Bishop of Florence, another adherent of the dual house of Tuscany. He accordingly ascended the chair of St. Peter. Like each of his three immediate predecessors, he sat there at the nomination of Hildebrand—the one great minister of his reign, and director of his measures. At his instance, Nicholas the Second (so was he now called) summoned a council at which was first effected, in the year 1059, a revolution, the principle of which, at the distance of eight centuries, still flourishes in unimpaired vitality. It, for the first time, conferred on the college of cardinals the exclusive right of voting at papal elections. It set aside not only the acknowledged rights of the emperor to con-

firm, but the still more ancient privilege of the Roman clergy and people to nominate their bishop. But Hildebrand was now strong enough in his Norman alliance, to defy a power before which so many churchmen had trembled. At his summons, Robert Guiscard broke down the fortresses of the Roman counts and barons, who, with their retainers, had been accustomed, in the comitia of papal Rome, to rival the exploits of Clodius and his gladiators. Their authority was arrested forever, and from that period their name ceases to appear in the history of pontifical elections. The title of duke and a recognition of his sovereignty, over all the conquests which he had made, or should ever make, rewarded the obedience of the Norman freebooter.

This service rendered to the cause of sacerdotal independence, Nicholas died. It was a cause which, however much advanced by the profound sagacity and promptitude of Hildebrand, could, as he well knew, triumph over the hostility of its powerful antagonists by no means less hazardous or less costly than that of open and protracted war. During the minority of Henry such a conflict could hardly be commenced, still less brought to a decisive issue. The rights of the royal child derived from his very weakness a sanctity in the hearts, and a safeguard in the arms, of his loyal German subjects. The time of mortal struggle was not yet come. The aspiring cardinal judged that by again resigning to another the nominal conduct, he could best secure to himself the real guidance, of the impending controversy.

To obtain from the empress-regent an assent to the observance by the Sacred College of the new electoral law, was the first object of the conclave which assembled after the death of Nicholas at the command of Hildebrand. At his instance an envoy was dispatched to the Imperial court, with the offer that the choice should fall on any ecclesiastic whom Agnes might nominate, if she would consent that the cardinals alone should appear and vote at the ceremonial. The compromise was indignantly rejected. A synod of imperialist prelates was convened at Basil, and by them Cadolous, Bishop of Parma, (the titular Honorius the Second,) was elevated to the vacant Papacy. To this defiance the cardinal-archdeacon, and his brethren, answered by the choice of Anselm, Bishop of Lucca, afterwards known in history as Alexander, the second of that name. After a brief but sanguinary conflict in the open field, each of the rival popes, at the mediation of Godfrey, retired to his diocese, there to await the judgment of a future council on their pretensions. But Alexander did not quit the city until he had acknowledged and rewarded the services of the head and leader of his cause. Hildebrand now received the office of Chancellor of the Holy See, the best and the highest recompense which he could earn, by raising others to supreme ecclesiastical dominion. Two successive councils confirmed the election of Alexander, who continued during twelve years to rule the church with dignity, if not in peace.

The time had at length arrived when Hildebrand was to receive the high and hazardous reward which his unflinching hopes had so long contemplated, and his self-controlling policy so often declined. Leo, Victor, Stephen, Nicholas, and Alexander, had each been indebted to his authority for the pontificate, and to his councils for the policy with which it had been administered. Successively cardinal, deacon, archdeacon, legate, and

chancellor of the apostolic see, one height alone was yet to be scaled. In the great church of the Lateran the corpse of Alexander was extended on the bier. A solemn requiem commended to the Supreme Judge the soul of the departed, when the plaintive strain was broken by a shout, which, rising as it seemed spontaneously and without concert from every part of the crowded edifice, proclaimed that, by the will of the holy Peter himself, the cardinal-chancellor was pope. From the funeral procession Hildebrand flew to the pulpit. With impassioned gestures, and in a voice inaudible amidst the uproar, he seemed to be imploring silence; but the tempest was not to be allayed until one of the cardinals announced, in the name of the Sacred College, their unanimous election of him whom the apostle and the multitude had thus simultaneously chosen. Crowned with the tiara, and arrayed in the gorgeous robes of a pope-elect, Gregory the Seventh was then presented to the people. Their joyous exultation, and the pomp of the inaugural ceremonies, blended and contrasted strangely with the studied gloom and the melancholy dirge of the funeral rites.

That this electoral drama was a mere improvisation, may be credited by those before whose faith all the mountains of improbability give way. But thus to reach the summit of sacerdotal dominion as if by constraint; and thus, without forfeiting the praise of severe sanctity, to obtain the highest of this world's dignities; and thus to anticipate and defeat the too probable resistance of the imperial court; and thus to afford the cardinals the opportunity and the excuse for the prompt exercise of their yet precarious electoral privilege—was a combination and a coincidence of felicities such as fortune, unaided by policy, seldom, if ever, bestows even on her choicest favorites. He who had nominated five popes, was, assuredly, no passive instrument in his own nomination. His letters, written on the occasion, would alone be sufficient to prove, if proof were wanting, that a career thus far guided by the most profound sagacity, was not abandoned at its crisis to the caprice of a dissolute multitude. To several of his correspondents he addressed pathetic descriptions of his alarm and sorrow, but with an uniformity of terms so remarkable as to suggest the belief, that the elegiac strain was repeated as often as necessary by his secretaries, with such variations as their taste suggested. To the emperor he breathed nothing but submission and humility. The most unimpeachable decorum presided over the whole ceremonial that followed. Envoys passed and re-passed. Men of grave aspect instituted tedious inquiries. Solemn notaries attested prolix reports; and in due time the world was informed, that of his grace and clemency Henry, king of Germany and Italy, calling himself emperor, had ratified the election of his dearly-beloved father, Gregory the Seventh; the world, meanwhile, well knowing that despite the emperor's hostility, the pope was able and resolved to maintain his own; and that, if his power had seconded his will, the emperor would have driven the pope from Rome, as the most dangerous of rebels and the most subtle of usurpers.

But Henry was ill prepared for such an effort. During the first six years of his reign, the affairs of his vast hereditary empire had been conducted by his widowed mother. She was formed to love, to reverence, and to obey. In an age less rude, or in a station less exalted, her much long-

suffering, her self-sustaining dignity, and the tenderness of her gentle spirit, might have enabled her to win even obedience. But her mind was ductile, her conscience enfeebled by a morbid sensibility, and her character formed by nature and by habit for subservience to any form of superstitious terror. She was surrounded by rapacious nobles whom no sacrifices could conciliate, and by lordly churchmen, who at once exacted and betrayed her confidence. Though severely virtuous, she was assailed by shameless calumnies. Her female rule was resented by the pride of Teutonic chivalry, and fraud and violence combined to inflict the deepest wound on her rights as a sovereign, and her feelings as a mother.

At Kaiserworth, on the Rhine, Agnes and her son, then in his thirteenth year, were reposing from the fatigues of an imperial progress. A galley, impelled by long lines of oars, and embellished with every ornament which art and luxury could command, appeared on the broad stream before them. Attended by a train of lords and servitors, Anno, the Archbishop of Cologne, descended from the gallant barge, and pressed the royal youth to inspect so superb a specimen of aquatic architecture and episcopal magnificence. Henry gladly complied, and, as the rowers bent to their oars, he enjoyed with boyish delight the rapidity with which one object after another receded from his view, till, turning to the companions of what had hitherto seemed a mere holiday voyage, he read in the anxious countenances of the commanders, and the vehement efforts of the boatmen, that he was a prisoner, and more than ever an orphan. With characteristic decision, he at once plunged into the water, and endeavored to swim to shore; but the toils were upon him. A confederacy, formed by the Archbishops of Cologne, and Mentz, and supported by the Dukes of Bavaria and Tuscany, consigned their young sovereign to a captivity at once sumptuous and debilitating. They usurped the powers, and plundered the treasures of the crown. They bestowed on themselves and their adherents forests, manors, abbeys, and lordships. But to the future ruler of so many nations, they denied the discipline befitting his age, and the instruction due to his high prospects. They encouraged him, and with fatal success, to enervate by ceaseless amusement, and to debase by precocious debauchery, a mind naturally brave and generous. Anno has been canonized by the see of Rome. By the same ghostly tribunal, the monarch whom he kidnapped, betrayed, and corrupted, was excluded from the communion of the church when living, and from her consecrated soil when dead. Impartial history will reverse either sentence, and will reserve her anathemas rather for St. Anno, by whom the princely boy was exposed to the furnace of temptation, than for him in whose young mind the seeds of vice, so unsparingly sown, sprung up with such deadly luxuriance.

The heart of youth was never won by habitual indulgence. As Henry advanced towards manhood, the Archbishops of Cologne and Mentz discovered that they were the objects of his settled antipathy, and that they had to dread the full weight of a resentment at once just, vindictive, and unscrupulous. To avert that danger they transferred the charge of the royal youth to Adalbert, Archbishop of Bremen, rightly judging that his skill in courtly arts (for he had lived on affectionate terms with the deceased emperor) might

enable him to win his pupil's regard, but erroneously believing that his ecclesiastical zeal (for it seemed the master-passion of his soul) would induce him to employ that advantage in the defence and service of the hierarchy.

Adalbert, whose life is written in the church history of Adam of Bremen, was a man whose character was so strangely composite, and whose purposes were so immutably single, that he might have suggested portraits to Scott, epigrams to Young, antitheses to Pope, an analysis to Dryden, or to Shakspeare himself some rich and all-reconciling harmony. According to the aspect in which he was viewed, he might with equal justice be regarded as a saint or a man of pleasure, as a scholar or a courtier, as a politician or a wit. Now washing the feet of beggars, eloquently expounding Christian truth, or indignantly denouncing the sins of the rich and the great, the shifting scenes exhibited him amidst a throng of actors, jugglers, and buffoons, or as the soul and centre of a society where lords and ambassadors, prelates and priests of low degree, met to enjoy his good cheer, to partake of his merriment, and to endure his relentless sarcasms. At the very moment when, with irresistible address, he was insinuating himself into the favor of some potent count or bishop, the approach of another dignity would rouse him to bitter and unmeasured invective. From the laughing playfellow of his companions he would pass at once into their fierce assailant, and then atone for the extravagance of his passion by a bounty not less extravagant. But whether he preached or gave alms, whether philosophy, or fun, or satire, was his passing whim, he still enjoyed one luxury which habit had rendered indispensable. Parasites were ever at hand to confirm his own conviction, that Adalbert of Bremen was an universal genius, and that, under his fostering care, the see of Bremen was destined to become the northern capital of the universal church.

Nor was it strange that he believed them. Of the countless victims of self-idolatry, few have had so many seductions to that intoxicating worship. A military as well as an ecclesiastical prince, he witnessed the extension of his archiepiscopal dominion far along the shores of the Elbe and the Baltic. Kings solicited his personal friendship. Sweden and the empire accepted him as the mediator of peace. Envoys from every state in Europe, not excepting Constantinople, thronged his palace. He was at once the confidential adviser of the pope and the chief minister of the emperor, and even boasted (with whatever truth) that he had declined the papacy itself. But this earlier Wolsey, like his great antitype, longed for some imperishable monument of his glory. Bremen was the Ipswich of Adalbert; the site selected, but in vain, for perpetuating to the remotest ages the memory of an ambition less ennobled by the greatness of its aims, than debased by an insatiable vanity. To aggrandize his diocese, he builded and fortified, negotiated and intrigued, became by turns a suitor and an oppressor, conciliated attachments and braved enmities, and lived and died the imaginary patriarch of the imaginary patriarchate of the German and Scandinavian nations.

Brightly dawned on the young Henry the day which transferred the change of his person and of his education from the austere Anno to the princely Adalbert. The Archbishop of Cologne had rebuked the vices he indulged. The conscience of the Archbishop of Bremen demanded no

such soothing compromise. He fairly threw the reins on the neck of his royal charge, who invoked the aid of young and profligate companions to use or to abuse this welcome indulgence. His tutors had sown the wind; his people were now to reap the whirlwind. Of the domestic life of the young emperor, the dark tale recorded by the chroniclers of his age would not be endured by the delicacy of our own. His public acts might seem to have been prompted by the determination to exasperate to madness the national pride, the moral sense, and the religious feelings of his subjects. Yet even when thus provoked, their resentment slumbered. A popular address, a noble presence, and the indulgence so liberally yielded to the excesses of the great, the prosperous, and the young, gave scope for the full expansion of his crimes and follies. At the Lateran the influence of his personal qualities was unfelt. Roused to a just indignation by the frequent intelligence of a life so debauched, and of a reign so impious, Alexander cited the emperor to appear at Rome, there to answer in person to the apostolic throne for the simony and the other offences imputed to him. The voice was Alexander's voice, but the hand was the hand of Gregory.

Between the day on which Hildebrand conducted Leo the Ninth into Rome as a simple pilgrim, to the time of his own tumultuary election, the quarter of a century had intervened. During the whole of that period he had been the confidential minister and guide of the Papacy. In each of the five pontificates which he had nominally served and really governed, the holy see had pursued the same aggressive policy with a steadfastness indicating the guidance of one far-seeing mind gifted with patience to await, with promptitude to discern, and with courage to seize the moments of successful advance. When, therefore, the citation of Henry was issued in the name of the dying pope, none doubted that this audacious act, then without a parallel in history, had been dictated by the same stern and unrelenting councillor. When tidings reached the imperial court that the voice of the people and the votes of the cardinals had placed in Gregory's hands the mysterious keys and the sharp sword of Peter, none doubted the near approach of the conflict which was to assign the supreme dominion over the Christian world, either to the German sceptre, or to the Roman crossier. That, after ages of war and controversy, they should peacefully exercise a concurrent yet divided rule, would have seemed an idle dream to a generation whose feudal theory of government had for its basis the principle of various gradations of dependency on some one common head, or suzerain.

With a life unstained by any sensual or malignant crime, (a praise of which his contemporary and rancorous biographer, Cardinal Benno, is the reluctant and unconscious witness,) and self-acquitted of any selfish ends, (for except as the champion of the church he neither obtained nor sought any personal aggrandizement,) Pope Hildebrand surrendered himself freely to the current of those awful thoughts which have peopled the brain of each of the successors of Peter in his turn, the basest and the most impure scarcely excepted. A mystery to himself, he had become the supreme vicar of Christ on earth; the predestined heir of a throne among those saints who should one day judge the world; the mortal head of an immortal dynasty; the depository of power delegated yet

divine; the viceroy to whom had been entrusted by God himself the care of interests, and the dispensation of blessings and of curses, which reduced to inappreciable vanities all the good and evil of this transitory world. Resolute as he was, he appears to have trembled at the contrast between the weakness of his human nature and the weight of these majestic responsibilities. With the abbots of Clugni and of Monte Cassino he maintained a relation, as much resembling friendship as was compatible with the austerity of his nature and his habits; and to them he depicted the secret tumults of his mind, in terms of which it would be impossible to deny either the sincerity or the eloquence.

Before his prophetic eye arose a vast theocratic state, in which political and religious society were to be harmonized, or absorbed into each other. At the head of this all-embracing polity, the Bishop of Rome was to assert his legitimate authority over all the kings and rulers of the earth. In immediate dependence on him was to be ranged the circle of his liege spiritual lords—some residing at the seat of empire as electors, councillors, and ministers to the supreme potentate; others presiding over the fraternities, the provinces, and the sees of which his empire was composed. At the capital of this hierarchal state were to be exercised the various powers of government—legislative, administrative, and judicial. There also were to be held the occasional meetings of the extraordinary or ecumenical legislature. To the infallible sovereign of this new Jerusalem were to be assigned prerogatives limited only by his own conscience, and restrained by no power but that of God himself. To the emperor, the kings, the dukes, and counts, his feudatories, was to be entrusted a ministry subordinate and auxiliary to his. They were to maintain order, to command armies, to collect revenues, to dispense justice. But they were to hold their crowns or coronets at the pleasure of the autocrat; to justify to him the use of their inferior authority, and to employ it in support of that power, which, derived from heaven itself, could acknowledge no superior, equal, or competitor on earth. But woe—such woe as vengeance, almighty and unrelenting, could inflict—on him who should impiously wield the pontifical sceptre, in the name of Christ, in any spirit, or for any ends, not in accordance with these awful purposes which once made Christ himself a sojourner among men! Heathen Rome had been raised up to conquer and to civilize. To Christian Rome was appointed a far loftier destiny. It was here to mediate between hostile nations, to reconcile sovereigns and their people—to superintend the policy, restrain the ambition, redress the injustice, and punish the crimes of princes—to render the apostolic throne the source and centre of a holy influence, which, diffused through every member of the social body, should inform, and animate, and amalgamate the whole, and realize the inspired delineation of that yet unborn age, when the lion and the lamb should lie down together, with a little child their leader.

Sublime as were the visions which thus thronged on the soul of Gregory the Seventh, and which still shed a glowing light over his three hundred and fifty extant letters, life was never, for a single day, a state of mere visionary existence to him. Before him lay the impending struggle with Henry, with Honorius, with the ecclesiastics of

Lombardy, with the German people, whose loyalty had so long survived the sorest provocation, and with many even of the German prelates, who ascribed to the successor of Charlemagne and of Otho the same rights which these great monarchs had exercised over the Pontiffs of an earlier generation. Nor was he unconscious that the way for his theocracy must be paved by reforms, so searching as to convert into inexorable antagonists many of those on whose attachment to his person and his laws he might otherwise have most implicitly relied.

Yet it was with no faint auguries of success that he girded himself for the battle. His Norman feudatories to the south, his Tuscan alliance to the north, promised security to the papal city. Disaffection was widely spread among the commonalty of the empire. The Saxons were on the verge of revolt. The Dukes of Swabia, Carinthia, and Bavaria, were brooding over insufferable wrongs. From the young and debauched emperor, it seemed idle to dread any resolved or formidable hostility. From the other powers of Europe, Henry could expect no succor. From every region of Christendom a voice, addressed and audible to the supreme pontiff, invoked a remedy for the traffic in holy things, and for the fearful pollutions beneath which the church was groaning; and that heavenly voice promised to him, when he should have strangled those monsters of iniquity, every honor which man could confer, and every benediction which God bestows on his most favored servants. He heard, and he obeyed it.

From the most remote Christian antiquity, the marriage of clergymen had been regarded with the dislike, and their celibacy rewarded by the commendation, of the people. Among the ecclesiastical heroes of the four first centuries, it is scarcely possible to point to one who was not, in this respect, an imitator of Paul rather than of Peter. Among the ecclesiastical writers of those times, it is scarcely possible to refer to one by whom the superior sanctity of the unmarried to the conjugal state is not either directly inculcated or tacitly assumed. This prevailing sentiment had ripened into a customary law, and the observance of that custom had been enforced by edicts and menaces, by rewards and penalties. But nature had triumphed over tradition, and had proved too strong for councils and for popes.

When Hildebrand ascended the chair first occupied by a married apostle, his spirit burned within him to see that marriage held in her impure and unhallowed bonds a large proportion of those who ministered at the altar, and who handled there the very substance of the incarnate Deity. It was a profanation well adapted to arouse the jealousy, not less than to wound the conscience, of the pontiff. Secular cares suited ill with the stern duties of a theocratic ministry. Domestic affections would choke or enervate in them that corporate passion which might otherwise be directed with unmitigated ardor towards their chief and centre. Clerical celibacy would exhibit to those who trod the outer courts of the great Christian temple, the impressive and subjugating image of a transcendental perfection, too pure not only for the coarser delights of sense, but even for the alloy of conjugal or parental love. It would fill the world with adherents of Rome, in whom every feeling would be quenched which could rival that sacred allegiance. From every monas-

tery might be summoned a phalanx of allies to overpower the more numerous, but dispersed and feeble antagonists of such an innovation. In every mitred churchman it would find an active partisan. The people, ever rigid in exacting eminent virtue from their teachers, would be rude but effective zealots of a ghostly discipline from which they were themselves to be exempt.

With such anticipations, Gregory, within a few weeks from his accession, convened a council at the Lateran, and proposed a law, not, as formerly, forbidding merely the marriage of priests, but commanding every priest to put away his wife, and requiring all laymen to abstain from any sacred office which any wedded priest might presume to celebrate. Never was legislative foresight so verified by the result. What the great Council of Nicæa had attempted in vain, the bishops assembled in the presence of Hildebrand accomplished, at his instance, at once, effectually, and forever. Lamentable indeed were the complaints, bitter the reproaches, of the sufferers. Were the most sacred ties thus to be torn asunder at the ruthless bidding of an Italian priest! Were men to become angels, or were angels to be brought down from heaven to minister among men! Eloquence was never more pathetic, more just, or more unavailing. Prelate after prelate silenced these complaints by austere rebukes. Legate after legate arrived with papal menaces to the remonstrants. Monks and abbots preached the continency they at least professed. Kings and barons laughed over their cups at many a merry tale of compulsory divorce. Mobs pelted, hooted, and besmeared with profane and filthy baptisms the unhappy victims of pontifical rigor. It was a struggle not to be prolonged—broken hearts pined and died away in silence. Expostulations subsided into murmurs, and murmurs were drowned in the general shout of victory. Eight hundred years have since passed away. Amidst the wreck of laws, opinions, and institutions, this decree of Hildebrand's still rules the Latin Church, in every land where sacrifices are offered on her altars. Among us, but not of us—valuing their rights as citizens, chiefly as instrumental to their powers as churchmen—ministers of love, to whom the heart of a husband and a father is an inscrutable mystery—teachers of duties, the most sacred of which they may not practise—compelled daily to gaze on the most polluted imagery of man's fallen heart, but denied the refuge of nature from a polluted imagination—professors of virtue, of which, from the death of the righteous Abel down to the birth of the fervent Peter, no solitary example is recorded in Holy Writ—excluded from that posthumous life in remote descendants, the devout anticipation of which enabled the patriarchs to walk meekly, but exultingly with their God—sacerdotal caste still flourishes in every Christian land, the imperishable and gloomy monument of that far-sighted genius which thus devised the means of papal despotism, and of that short-sighted wisdom which proposed to itself that despotism as a legitimate and laudable end.

With this Spartan rigor towards his adherents, Gregory combined a more than Athenian address and audacity towards his rivals and antagonists. So long as the monarchs of the West might freely bestow on the objects of their choice the sees and abbeys of their states, papal dominion could be but a passing dream, and papal independency an empty boast. Corrupt motives est-

ally determined that choice; and the objects of it were but seldom worthy. Ecclesiastical dignities were often sold to the highest bidder, and then the purchaser indemnified himself by a use no less mercenary of his own patronage; or they were given as a reward to some martial retainer, and the new churchman could not forget that he had once been a soldier. The cope and the coat-of-mail were worn alternately. The same hand bore the crucifix in the holy festival, and the sword in the day of battle. Episcopal warriors and abbatial courtiers thus learned to regard themselves rather as feudatories holding of their temporal lord, than as liegemen owing obedience to their spiritual chief. In the hands of the newly consecrated bishop was placed a staff, and on his finger a ring, which, received as they were from his temporal sovereign, proclaimed that homage and fealty were due to him alone. And thus the sacerdotal proconsuls of Rome became, in sentiment at least, and by the powerful obligation of honor, the vicegerents, not of the Pontifex Maximus, but of the Emperor.

To dissolve this *trinoda necessitas* of simoniacal preferments, military service, and feudal vassalage, a feebler spirit would have exhorted, negotiated, and compromised. To Gregory it belonged to subdue men by courage, and to rule them by reverence. Addressing the world in the language of his generation, he proclaimed to every potentate, from the Baltic to the Straits of Calpé, that all human authority being holden of the divine, and God himself having delegated his own sovereignty over men to the Prince of the Sacred College, a divine right to universal obedience was the inalienable attribute of the Roman pontiffs, of whom, as the supreme earthly suzerain, emperors and kings held their crowns, patriarchs and bishops their mitres, and held them not mediately through each other, but immediately as tenants *in capite* from the one legitimate representative of the great apostle.

In turning over the collection of the epistles of Hildebrand, we are everywhere met by this doctrine asserted in a tone of the calmest dignity and the most serene conviction. Thus he informs the French monarch that every house in his kingdom owed to Peter, as their father and pastor, an annual tribute of a penny, and he commands his legates to collect it in token of the subjection of France to the Holy See. He assures Solomon the King of Hungary, that his territories are the property of the Holy Roman Church. Solomon being incredulous and refractory, was dethroned by his competitor for the Hungarian crown. His more prudent successor, Ladislaus, acknowledged himself the vassal of the pope, and paid him tribute. To Corsica a legate is sent to govern the demesnes of the Papacy in the island, and to recover the rest of it from the Saracens. To the Sardinians an account is despatched of her title to their obedience, with menaces of a Norman invasion if it should be withheld. On Demetrius, Duke of Dalmatia, we find him conferring the kingly title, reserving a yearly payment of two hundred pieces of silver "to the holy Pope Gregory, and his successors lawfully elected, as supreme lords of the Dalmatian kingdom." Among the visitors of Rome was a youth described in one of these epistles as son of the King of Russia. The letter informs the sovereign so designated, that, at the request of the young prince, the pontiff had administered to him the oath of fealty to St.

Peter and his successors, not doubting that "it would be approved by the king and all the lords of his kingdom, since the apostle would henceforth regard their country as his own, and defend it accordingly." From Sweno the Dane he exacted a promise of subjection. From the recently converted Polanders he demanded, and received, as sovereign lord of the country, an annual tribute of an hundred marks in silver. From every part of the European continent, bishops are summoned by these imperial missives to Rome, and there are either condemned and deposed, or absolved and confirmed in their sees. In France, in Spain, and in Germany, we find his legates exercising the same power; and the correspondence records many a stern rebuke, sometimes for their undue remissness, sometimes for their misapplied severity. The rescripts of Trajan scarcely exhibit a firmer assurance both of the right and the power to control every other authority, whether secular or sacerdotal, throughout the civilized world.

There was, however, one memorable exception. Robert the Norman conqueror of Sicily, and William the Norman conqueror of England, steeped in blood and sacrilege, were the most shameless and cruel of usurpers. The groans and curses of the oppressed cried aloud for vengeance against them. But the apostolic indignation, though roused by the active vices of the emperor, and the apathetic depravity of Philip of France, had for these tyrants no menaces of ghostly wrath, no exhortations to repentance. Robert was embraced and honored as the faithful ally of Rome. William was addressed in the blandest accents of esteem and tenderness. "You exhibit towards us" (such is the style) "the attachment of a dutiful son, yea, of a son whose heart is moved by the love of his mother. Therefore, my beloved son, let your conduct be all that your language has been. Let what you have promised be effectually performed." The injunction was not disobeyed, for even of promises the grim conqueror of the north had been sufficiently parsimonious. As Duke of Normandy he remitted to the pope the amount of certain dues. As King of England he indignantly refused the required oath of fealty. "I hold my kingdom of God and of my sword," was his stern and decisive answer. Something the papal legate dared to mutter of the worthlessness of gold without obedience; but the gold was accepted and the disobedience endured. These were not the days of John, surnamed Lackland; and for Innocent the Third was reserved by his great predecessor the glory of receiving, from an English sovereign on his bended knee, the crown which, on the head of William, challenged equal honors with the papal tiara. For concessions favorable to his hopes of unlimited dominion, the pontiff turned to a sovereign whose crimes no triumphs had sanctified, and no heroism redeemed.

Alexander's citation had been despised by Henry, and was not revived by Hildebrand. Every post from Germany brought fresh proof that, without the use of weapons so hazardous, the emperor must, ere long, be reduced to solicit the aid of Rome on such terms as Rome might see fit to dictate. Dark as were the middle ages, the German court had light enough (if we may credit the chronicles) to anticipate our own enlightened Irish policy. The ancient chiefs of Saxony were imprisoned, their estates confiscated, and granted to absent lords and prelates. Tithe proctors hov-

ered like birds of prey over the Saxon fields. A project was formed for driving the ancient inhabitants into a Saxon pale, and for converting the land into a great Swabian colony. Castles frowned on every height. Their garrisons pillaged and enlaved the helpless people. Alliances were formed with the Bavarian and the Dane to crush a race hated for their former preëminence, and despised for their recent sufferings. Nothing was wanting to complete the parallel but discord and dejection amongst the intended victims.

Groaning under the oppressions, and penetrating the designs of their sovereign, the Saxons solicited for their leaders an audience at Goslar. The appointed day arrived. The deputies presented themselves at the palace. Henry was engaged at a game of hazard, and bade them wait till he had played it out. A stern and indignant demand for justice repelled the insult. A second time, in all the insolence of youth, Henry returned a contemptuous answer. In a few hours he found himself blockaded at his castle of Hartzburg by a vast assemblage of armed men, under the command of Otho of Nordhim, the Tell or Hofer of his native land.

Escaping with difficulty, the emperor traversed Western Germany to collect forces for crushing the Saxon insurgents. But the spell of his Imperial name and of his noble presence were broken. The crimes of a defeated fugitive were unpardonable. His allies made common cause with the Saxons, whom they had so lately leagued to destroy. Long repressed resentment burst out in the grossest indignities against the recreant sovereign. Unworthy to wear his spurs or his crown, (so ran the popular arraignment,) he descended at a step from the summit of human greatness almost to the condition of an outcast from human society. A Diet had been summoned for his deposition. His sceptre had been offered to Rudolf of Swabia. A few days more, and his crown, if not his life, had been forfeited, when an opportune illness and a rumor of his death awakened the dormant feelings of reverence and compassion. Haggard from disease, abject in appearance, destitute, deserted, and unhappy, he presented himself to the citizens of Worms. The ebbing tide of loyalty rushed violently back into its wonted channels. Shouts of welcome ran along the walls. Every house-top rang with acclamations. Women wept over his wrongs. Men-at-arms devoted their lives, rich burghers their purses, to his cause. The Diet was dissolved. Rudolf fled, and it remained for Henry to practise, on his recovered throne, the lessons he had learned in the school of adversity.

Those lessons had been unfolded and enforced by the parental admonitions of Gregory. The royal penitent answered by promises of amendment, "full" (as the pope declared) "of sweetness and of duty." Nor was this a mere lip homage. To prove his sincerity, he abandoned to the pope the government of the great see and city of Milan, the strongest hold of the Imperialists in Italy. A single desire engrossed the heart of Henry. No sacrifice seemed too costly which might enable him to inflict an overwhelming vengeance on the Saxon people; no price excessive by which he could purchase the aid, or at least the neutrality, of Hildebrand in the impending struggle. The concessions were accepted by the pope, the motive understood, and the equivalent rendered. With gracious words to the emperor

and to Rudolf, with pacific councils and vague promises to the Saxons, the pope retired from all further intervention in a strife of which it remained for him to watch the issue and to reap the advantage.

It was in the depth of a severe winter that Henry, hoping to surprise the insurgents, marched from Worms at the head of forces furnished by the wealth and zeal of that faithful city. Drifts of snow obstructed his advance. The frozen streams could no longer turn the mills on which he depended for subsistence. Meteors blazed in the skies, and the dispirited soldiers trembled at such accumulated omens of disaster. In that anxious host, one bosom only was heedless of danger, and unconscious of suffering. He, who had hitherto been known only as a profligate and luxurious youth, now urged on his followers through cold, disease, and famine, to the Saxon frontier. But there Otho awaited him at the head of a large and well-disciplined army. The Imperialists declined the unequal encounter. Again Henry was reduced to capitulate. Humbled a second time before his subjects, he bound himself to dismantle his fortresses, to withdraw his garrisons, to restore the confiscated fiefs, to confirm their ancient Saxon privileges, and to grant an amnesty unlimited and universal.

The treaty of Gerstungen (so it was called) was dictated by animosity and distrust, and was carried into execution by the conquerors in the spirit of vindictive triumph. They expelled from his residence at Goslar their dejected king and his household, and destroyed the town of Hartzburg with its royal sepulchre, where lay the bones of his infant son, and of others of his nearest kindred. The graves were broke open, and their ghastly contents exposed to shameful and inhuman contumelies—a wild revenge, and a too plausible pretext for a fearful and not distant retribution.

Henry returned to his Rhenish provinces to meditate vengeance. Reckless of any remoter danger in which the indulgence of that fierce passion might involve him, he invoked the arbitrement of Hildebrand, and called on him to excommunicate the sacrilegious race who had burned the church and desecrated the sepulchres of his forefathers. Gregory watched the gathering tempest of civil war, received the appeals of the contending parties, and answered both by renewed injunctions of obedience to himself. To the Saxons he sent homilies, to the emperor an embassy, graced by the name and the presence of his mother, Agnes. She bore a papal mandate to her son to enforce the celibacy of the clergy, and to restore to its lawful channels the patronage of the church. Henry promised obedience. The legates then convoked a national Synod, to be held in Germany under their own presidency. To this encroachment also, Henry submitted. A remonstrance against it from the Archbishop of Bremen was answered by a legantine sentence suspending him from his see. Still the emperor was passive. Another sentence of the papal ambassadors exiled from the court and presence of Henry, five of his councillors whom Alexander had excommunicated. No signal of resistance was given by their insulted sovereign. Edicts for the government of the Teutonic Church were promulgated without the usual courtesy of asking his concurrence. They provoked from him no show of resentment. Their work accomplished, the legates then returned to Rome, the messengers of successes more important

than any former pope had ventured to contemplate over the authority of the Cæsar. Applause, honors, preferments rewarded her associates; while to Agnes herself were given assurances of celestial joy, and of a distinguished place among the choristers of heaven.

Her less aspiring son fed his mind with hopes of vengeance, rendered as he thought more sure by all his concessions to the Roman Pontiff. Twice, indeed, he had recoiled ignominiously from the Saxon frontier. But from defeat itself he might draw the means of victory. By the great feudatories of the empire, the spectacle of armed peasants and wealthy burghers imposing terms of peace on the successor of Charlemagne, had been regarded with proud scorn and indignation. They resented the rising fame and influence of Otho. He and his followers might become strong enough to resume by arms the estates they had lost by confiscation. Rumors were already rife of such designs. To fan these flames, and deepen these alarms, to excite among restless chiefs and predatory bands the appetite for war and plunder, became the easy and successful labor of the impatient emperor. At Henry's summons, the whole strength of Germany collected on the Elbe to crush in his quarrel the power they had so lately aided to depose him. There were to be seen the crucifix of the Abbot of Fulda, and there the sacred banner of the Archbishop of Mentz. There Guelph, the Bavarian, raised his ducal standard to reconquer the broad lands restored to their former owners by the treaty of Gerstungen. There, surrounded by the chivalry of Lorraine, and restored by the emperor to that forfeited principality, Godfrey repaid the boon by the desertion of the alliance, conjugal as well as political, which bound him to the House of Tuscany. There appeared the King of Hungary, lured by the hope of new provinces to be assigned to him on the dismemberment of Saxony. And there, in the centre of countless pennons, came Rudolf, to prove his loyalty to the prince whose throne he had so recently endeavored to usurp.

The tide of war rolled on towards the devoted land. It had been saved, if penitence, humility, and prayer were of the same power in the courts of earth as in those of heaven. It had been saved, if courage gathered from despair, and guided by patriotism, could have availed against such a confederacy of numbers and of discipline. But prayer was vain, and patriotism impotent. A long summer's day had reached its close, when, under the command of their great leader Otho, the Saxon lines approached the Unstrut. On the opposite banks of that stream the imperialists had already encamped. Neither army was aware of the vicinity of the other, and Henry had retired to rest, when Rudolf roused him with the intelligence that the insurgent forces were at hand, unarmed, and heedless of their danger, the ready prey of a sudden and immediate attack. The emperor threw himself into a transport of gratitude at the feet of his adviser, and leaping on his horse, led forward his forces to the promised victory.

In this strange world of ours, tragedies, of which the dire plot and dark catastrophe might seem to be borrowed from hell, are not seldom depicted by historical dramatists, in colors clear and brilliant as those which may be imagined to repose over Paradise. One of the mitred combatants has sung, and Lambert, the chronicler of Aschafnaburg, has narrated, the battle of the Unstrut. The bishop's

hexameters have all the charm which usually belongs to episcopal charges. But Lambert is among the most graphic and animated of historians. His picture of the field glows with his own military ardor, and is thronged with incidents and with figures which might well be transferred to the real canvass. Among them we distinguish the ill-arranged Saxon lines broken, flying, and again forming at the voice of Otho, as it rises above the tumult, and then rushing after him with naked swords, and naked bosoms, on the main battle of the triumphant invaders. And still the eye follows Otho wherever there are fainting hearts to rally, or a fierce onslaught to repel;—and we seem almost to hear the shrill Swabian war-cry from the van of the Imperial host, where by a proud hereditary right they had claimed to stand;—and Rudolf their leader, the very minister of death, is ever in the midst of the carnage, himself, as if in covenant with the grave, unharmed;—and in the agony and crisis of the strife, Henry, the idol to whom this bloody sacrifice is offered, is seen in Lambert's battle-piece, leaping at the head of his reserve on his exhausted enemies, sweeping the whole ranks into confused masses, and amidst shrieks, and groans, and fruitless prayers, and fruitless curses, immolating them to his insatiable revenge.

The sun went down on that Acelanda amidst the exultations of the victorious allies. It rose on them the following morning agitated by grief, by discord, and by disaffection. Many nobles who had fought the day before under the imperial banner, were stretched on the field of battle. The enthusiasm of the Saxons had proved at how fearful a price, if at all, the selfish ends of the confederacy must be attained. They mourned the extinction of one of the eyes of Germany. Silently but rapidly the armament dissolved. Godfrey alone remained to prosecute the war. With his aid it was brought to a successful issue. A capitulation placed Otho and the other leaders in the emperor's power. With their persons secured, their estates forfeited, and their resources destroyed, he returned to join with the loyal citizens of Worms in chanting the "Te Deum laudamus." The same sacred strain had but a few days before celebrated at Rome a still more important and enduring victory.

Gregory had rightly judged, that while the rival princes were immersed in civil war, he might securely convene the princes of the church to give effect to designs of far deeper significance. The long aisles of the Lateran were crowded with grave canonists and mitred abbots, with bishops and cardinals, with the high functionaries, and the humble apparitors of the papal state. Proudly eminent above them all, sat the vicar and vicergerent of the King of kings. Masses were sung, and homilies were delivered, and rites were performed, of which the origin might be traced back to the worship of the Capitoline Jove; and then was enacted by the ecclesiastical senate, a law, not unlike the most arrogant of those which eleven centuries before had been promulgated in the capitol. It forbade the kings and rulers of the earth to exercise their ancient right of investiture of any spiritual dignitary, and transferred to the pope alone a patronage and an influence more than sufficient to balance within their own dominions all the powers of all the monarchs of Christendom. In the darkest hours of imperial despotism, the successors of Julius had never enjoyed or demanded an authority so wide or so absolute. Even the

daring spirit by which it had been dictated, drew back from the immediate publication of such a decree. The pope intimated to the German court and prelates the other acts of the council, but passed over in silence the great edict for which they had been assembled, and by which they were to be immortalized. It reposed in the papal chancery as an authority to be invoked at a more convenient season, and in the mean time as a text for the devout to revere, and for the learned to interpret. To Hildebrand it belonged neither to expound nor to threaten, but to act.

The Bishop of Lucca was dead: the pope nominated his successor. The Bishop of Bamberg was accused of simony: the pope suspended him. The Archbishop of Bremen still denied the right of papal legates to preside in a German synod: the pope deprived him of his see and of the holy sacraments. The Bishops of Pavia, Turin, and Placentia adhered to Honorius: the pope deposed them. Henry's five exiled councillors gave no signs of repentance: the pope again excommunicated them. The Normans invaded the Roman territory: the pope assailed them by a solemn anathema. Philip of France continued to indulge himself, and to pillage every one else: the pope upbraided and menaced him. Thus with maledictions, sometimes as deadly as the Pomptine miasma, sometimes as innocuous as the Mediterranean breeze, he waged war with his antagonists, and exercised in reality the powers which he yet hesitated to assert in words.

To the conqueror of Saxony these encroachments and anathemas of the pontiff appeared more offensive than formidable. He retaliated rather by scorn than by active hostility. He heaped favors on his own excommunicated councillors—sent one of his chaplains to ascend the vacant throne—nominated an obscure and scandalous member of his own household for the princely mitre of Cologne, and forbade his Saxon subjects to appeal to Rome even in cases exclusively ecclesiastical. To Henry, the pontiff seemed an angry, arrogant, vituperative, old man, best to be encountered by contempt. To Gregory, the emperor appeared as the feeble and unconscious agent in a providential scheme for subjecting the secular to the spiritual dynasty. To such as could read the signs of the times, it was evident that, on either side, this contempt was misplaced, and that a long and sanguinary conflict drew near, by which the future destinies of the world would be determined.

Events hurried rapidly onward to that crisis. Complaints were preferred to the Holy See of crimes committed by Henry against the Saxon church which cried for vengeance, and of vices practised by him in private, which rendered him unfit for communion with his fellow Christians. Gregory cited the emperor to appear before him to answer these charges. The emperor, if we may believe the papal historians, answered by an attempt to assassinate the author of so presumptuous a citation.

On Christmas eve, in the year 1075, the city of Rome was visited by a dreadful tempest. Not even the full moon of Italy could penetrate the dense mass of superincumbent clouds. Darkness brooded over the land, and the trembling spectators believed that the day of final judgment was about to dawn. In this war of the elements, however, two processions were seen advancing to the church of Santa Maria Maggiore. At the head of one was the aged Hildebrand, conducting a few priests to worship at the shrine of the Virgin

Deipara. The other was preceded by Cencius, a Roman noble. His followers were armed as for some desperate enterprise. At each pause in the roar of the tempest might be heard the hallelujah of the worshippers, or the voice of the pontiff pouring out benedictions on the little flock which knelt before him—when the arm of Cencius grasped his person, and the sword of some yet more daring ruffian inflicted a wound on his forehead. Bound with cords, stripped of his sacred vestments, beaten, and subjected to the basest indignities, the venerable minister of Christ was carried to a fortified mansion within the walls of the city, again to be removed at daybreak to exile or to death. Women were there with women's sympathy and kindly offices, but they were rudely put aside, and a drawn sword was already aimed at the pontiff's bosom, when the cries of a fierce multitude threatening to burn or batter down the house, arrested the arm of the assassin. An arrow, discharged from below, reached, and slew him. The walls rocked beneath the strokes of the maddened populace, and Cencius, falling at the prisoner's feet, became himself a suppliant for pardon and for life.

In profound silence and undisturbed serenity, Hildebrand had thus far submitted to these atrocious indignities. The occasional raising of his eyes towards heaven alone indicated his consciousness of them. But to the supplication of his prostrate enemy he returned an instant and a calm assurance of forgiveness; he rescued Cencius from the exasperated besiegers, dismissed him in safety and in peace, and returned amidst the acclamations of the whole Roman people to complete the interrupted solemnities of Santa Maria Maggiore.

That Henry instigated this crime, is a charge of which no proof is extant, and to which all probabilities are opposed. But it was current at the time; and the contest thenceforward assumed all the bitterness of personal animosity. To the charges of sacrilege, impurity, and assassination, preferred against the emperor, his partisans answered by denouncing the pope himself, at a synod convened at Worms, as base-born, and as guilty of murder, simony, necromancy and devil worship, of habitual, though concealed, profligacy, and of an impious profanation of the Eucharist. Fortunately for the fame of Gregory, his enemies have written a book. Cardinal Benno, one of the most inveterate, has bequeathed to us a compendium of all those synodal invectives. The guilt of a base birth is established; for Hildebrand's father was a carpenter in the little Tuscan town of Saone. The other imputations are refuted by the evident malignity of the writer, and by the utter failure, or the wild extravagance, of his proofs.

Such, however, was not the judgment of the synod of Worms. A debate of two days' continuance, closed with an unanimous vote that Gregory the Seventh should be abjured and deposed. Henry first affixed his signature to the form of abjuration. Then each archbishop, bishop, and abbot, rising in his turn, subscribed the same fatal scroll. Scarcely was the assembly dissolved, before imperial messages were on their way to secure the concurrence of other churches, and the support of the temporal princes. On every side, but especially in Northern Italy, a fierce and sudden flame attested the long mouldering resentment of the priests whom the pope had divorced

from their wives; of the lords whose simoniacal traffic he had arrested; of the princes whose Norman invaders he had cherished; of ecclesiastics whom his haughty demeanor had incensed; of the licentious whom his discipline had revolted; and of the patriotic whom his ambition had alarmed. The abjuration of Worms was adopted with enthusiasm by another synod at Placenza. Oaths of awful significance cemented the confederacy. Acts of desperate hostility bore witness to their determination to urge the quarrel to extremities. Not a day was to be lost in intimating to Gregory that the apostolic sceptre had fallen from his hands, and that the Christian Church was once more free.

It was now the second week in Lent, in the year 1078. From his throne, beneath the sculptured roof of the Vatican, Gregory, arrayed in the rich mantle, the pall, and the other mystic vestments of pontifical dominion, looked down the far-receding aisle of the sacred edifice on the long array of ecclesiastical lords and princes, before whom "Henry, King of Germany and Italy, calling himself emperor," had been summoned to appear, not as their sovereign to receive their homage, but as a culprit to await their sentence. As he gazed on that new senate, asserting a jurisdiction so majestic—and listened to harmonies which might not unfitly have accompanied the worship of Eden—and joined in anthems which in far distant ages had been sung by blessed saints in their dark crypts, and by triumphant martyrs in their dying agonies—and inhaled the incense symbolical of the prayers offered by the Catholic church to her eternal Head—what wonder, if, under the intoxicating influence of such a scene and of such an hour, the old man believed that he was himself the apostolic rock on which her foundations were laid, and that his cause and person were sacred as the will, and invincible as the power, of heaven itself. The "Veni Creator" was on the lips of the papal choir, when Roland, as envoy from the synods of Worms and Placenza, presented himself before the assembled hierarchy of Rome. His demeanor was fierce, and his speech abrupt. "The king and the united bishops both of Germany and Italy," (such was his apostrophe to the pope,) "transmit to thee this command:—Descend without delay from the throne of St. Peter. Abandon the usurped government of the Roman Church. To such honors none must aspire without the general choice and the sanction of the emperor." Then addressing the conclave—"To you, brethren," he said, "it is commanded, that at the feast of Pentecost ye present yourselves before the king my master, to receive a pope and father from his hands. This pretended pastor is a ravenous wolf." A brief pause of mute astonishment gave way to shouts of fury. Swords were drawn, and the audacious herald was about to expiate his temerity with his blood. But Gregory descended from his throne, received from the hands of Roland the letters of the synods, and resuming his seat, read them in a clear and deliberate voice to the indignant council. Again the sacred edifice rang with a tempest of passionate invective. Again swords were drawn on Roland, and again the storm was composed by the voice of the pontiff. He spoke of prophecies fulfilled in the contumacy of the king and in the troubles of the faithful. He assured them, that victory would reward their zeal, or divine consolations soothe their defeat; but whether victory or

defeat should be their doom, the time, he said, had come when the avenging sword must be drawn to smite the enemy of God and of his church.

The speaker ceased, and turned for approbation, or at least for acquiescence, not to the enthusiastic throng of mitred or of armed adherents, but to one who, even in that eventful moment, divided with himself the gaze and the sympathy of that illustrious assemblage. For by his side, though in an inferior station, sat Agnes the empress-mother, brought there to witness and to ratify the judgment to be pronounced on her only child, whom she had borne amidst the proudest hopes, and trained for empire beneath the griefs and anxieties of widowhood. She bore or strove to bear herself as a daughter of the church, but could not forget that she was the mother of Henry, when, in all the impersonated majesty of that holy fellowship, Hildebrand, raising his eyes to heaven, with a voice echoing, amidst the breathless silence of the synod, through the remotest arches of the lofty pile, invoked the holy Peter, prince of the apostles, to hear, and "Mary the mother of God," and the blessed Paul and all the saints to bear witness, while for the honor and defence of Christ's church, in the name of the sacred Trinity, and by the power and authority of Peter, he interdicted to King Henry, son of Henry the emperor, the government of the whole realm of Germany and Italy, absolved all Christians from their oaths and allegiance to him, and bound him with the bond of anathema, "that the nations may know and acknowledge that thou art Peter, and that upon thy rock the Son of the living God hath built his church, and that the gates of hell shall not prevail against it."

When intelligence of the deposition of Henry first astounded the nations of Europe, the glories of papal Rome seemed to the multitude to have been madly staked on one most precarious issue. Men foretold that the emperor would promptly and signally punish a treason so audacious, and that the Holy See would, ere long, descend to the level of the Patriarchate of Constantinople. Nor did the wisest deem such anticipations unreasonable. They reflected that Henry was still in the very prime of life—that he possessed a force of will which habitual luxury had not impaired, and a throne in the hearts of his people which the wildest excess of vice and folly had not subverted—that he reigned over the fairest and the wealthiest portion of the continent—that he commanded numerous vassals, and could bring into the field powerful armies—that he had crushed rebellion among his subjects, and had no rival to dread among his neighbors—and that the papacy had flourished under the shelter of the imperial crown, the authority of which had been so arrogantly defied, and the fierce resentment of which was now inevitably to be encountered. But in the seeming strength of the imperial resources, there was an inherent weakness, and in the seeming weakness of the papal cause, a latent but invincible strength. Even Teutonic loyalty had been undermined by the cruelties, the faithlessness, and the tyranny of the monarch, and the doom of the oppressor was upon him. The cause of Gregory was, on the other hand, in popular estimation, the cause of sanctity and of truth, of primeval discipline and traditional reverence, and the pope himself a martyr, who, in all the majesty of superhuman power, was resolved either to repel the spoiler

from the Christian fold, or to lay down his life for the sheep. That these high and lofty purposes really animated the soul, or kindled the imagination of him to whom they were thus ascribed, it would be presumptuous to deny. But whatever may have been his reliance on the promises of Heaven, he certainly combined with it a penetrating insight into the policy of earth. He summoned to his aid his Norman feudatories, and invoked the succor of his Tuscan allies. She who now reigned in Tuscany might be supposed to have been called into being for the single purpose of sustaining, like another Deborah or Judith, the fainting hopes of another Israel.

On the death of Boniface, Duke and Marquis of Tuscany, in 1054, his states descended to his only surviving child, who, under the title of "The Great Countess," ruled there until her own death in 1116, first in tutelage, then in conjunction with her mother Beatrice, and, during the last thirty-nine years of that long period, in her own plenary and undivided right. Though she married Godfrey of Lorraine in her youth, and Guelph of Bavaria in her more mature age, neither the wit and military genius of her first husband, nor the wisdom and dignity of his successor, could win the heart of Matilda. Her biographer has entered into an elaborate inquiry to establish the fact, that, notwithstanding her nuptial vows with two of the most accomplished princes of that age, she lived and died as in a state of celibacy. Even they who cannot concur with him in pronouncing the sacrifice sublime, will admit that it was at least opportune. While persuading the clergy to put away their wives, she herself repudiated both her husbands. The story, indeed, is not very tractable. Schools for scandal preceded, as they have survived, all the other schools of modern Italy; and whoever has read Goldasti's "Replication for the Sacred Cæsarean and Royal Majesty of the Franks," is aware that if Florence had then possessed a comic stage and an Aristophanes, he would have exhibited no less a personage than the great Hildebrand in the chains of no meaner an Aspasia than the great Countess of Tuscany. But large as is the space occupied by this charge, and by the refutation of it, in the annals of those times, it may safely be rejected as altogether incredible and absurd. At that period, the anatomists of the human heart seem not to have described, if indeed they had detected, that hieropathic affection so familiarly known among ourselves, of which the female spirit is the seat, and the ministers of religion the objects—a flame usually as pure as it is intense, and which burned as brightly in the soul of Matilda eight centuries ago, as in the most ardent of the fair bosoms which it warms and animates now. She was in truth in love, but in love with the papacy. Six aged popes successively acknowledged and rejoiced over her, at once the most zealous adherent of their cause, and the most devoted worshipper of their persons. And well might those holy fathers exult in such a conquest. Poets in their dreams have scarcely imaged, heroes in the hour of their triumph have rarely attained, so illustrious a trophy of their genius or of their valor.

The life of Matilda is told by Donnizone, a member of her household, in three books of lamentable hexameters, and by Fiorentini, an antiquarian and genealogist of Lucca in the seventeenth century, in three other books scarcely less

wearisome; though his learning, his love of truth, and his zeal for the glory of his heroine, secure for him the respect and the sympathy of his readers. That she should have inspired no nobler eulogies than theirs, may be ascribed partly to her having lived in the times when the Boethian had subsided into the Bœotian age of Italian literature, and partly to the uninviting nature of the ecclesiastical feuds and alliances in which her days were consumed. Otherwise, neither Zenobia, nor Isabella, nor Elizabeth, had a fairer claim to inspire and to live in immortal verse. Not even her somnolent chaplain, as he beat out his Latin doggerel, could avoid giving utterance to the delight with which her delicate features, beaming with habitual gaiety, had inspired him. Not even her severe confessor, Saint Anselm of Lucca, could record without astonishment, how her feeble frame sustained all the burdens of civil government, and all the fatigues of actual war; burdens indeed, which but for a series of miraculous cures wrought for her at her own intercession, she could not (he assures us) have sustained at all.

Supported, either by miracle, or by her own indomitable spirit, Matilda wielded the sword of justice with masculine energy in the field against the enemies of the Holy See, or in the tribunal against such as presumed to violate her laws. He who knew her best, regarded these stern exercises of her authority but as the promptings of a heart which loved too wisely and too well to love with fondness. In the camp, such was the serenity of her demeanor, and the graceful flow of her discourse, that she appeared to him a messenger of mercy, in the garb of a Penthesilea. On the judgment-seat he saw in her not the stern avenger of crime, but rather the compassionate mother of the feeble and the oppressed.

Nor did she allow to herself any of the weak indulgence she denied to others. In a voluptuous age she lived austerely, subduing her appetites, and torturing her natural affections with the perverse ingenuity which her ghostly councillors inculcated and extolled. In a superstitious age she subdued her desire for the devotional abstractions of the cloister; and with greater wisdom, and more real piety, consecrated herself to the active duties of her princely office. In an illiterate age, her habits of study were such that she could make herself intelligible to all the troops among whom she lived, though levied from almost every part of Europe, and especially to the Italian, French, and German soldiers, whose tongues she used with equal facility. Donnizone assures us, that, though he was ever at hand as her Latin secretary, she wrote with her own pen all her letters in that language to the pontiffs and sovereigns of her times—a proof, as his readers will think, of her discernment no less than of her learning. On his testimony, also, may be claimed for her the praise of loving, collecting, and preserving books; for thus he sings—

"Copia librorum non deficit huic ve bonorum;
Libros ex cunctis habet artibus atque figuris."

How well she understood the right use of them, may be inferred from her employment of Werner, a jurist, to revise the "Corpus Jura Civilis," and of Anselm, her confessor, to compile a collection of the "Canon Law," and to write a commentary on the "Psalms of David." Such, indeed, was her proficiency in scriptural knowledge, that her versifying chaplain maintains her

equality in such studies with the most learned of the bishops, her contemporaries.

Warrior, ascetic, and scholar as she was, the spirit of Matilda was too generous to be imprisoned within the limits of the camp, the cell, or the library. It was her nobler ambition to be the refuge of the oppressed, and the benefactor of the miserable, and the champion of what she deemed the cause of truth. Mortifying the love of this world's glory, she labored with a happy inconsistency to render it still more glorious. At her bidding, castles and palaces, convents and cathedrals, statues and public monuments, arose throughout Tuscany. Yet, so well was her munificence sustained by a wise economy, that to the close of her long reign, she was still able to maintain her hereditary title to the appellation of "the rich," by which her father, Boniface, had been distinguished. She might, with no less propriety, have been designated as "the powerful;" since, either by direct authority, or by irresistible influence, she ruled nearly the whole of Northern Italy, from Lombardy to the Papal States, and received from the other monarchs of the West, both the outward homage and the real deference reserved for sovereign potentates.

Matilda attained to the plenary dominion over her hereditary states at the very crisis of the great controversy of her age, when Henry had procured and promulgated the sentence of the Synod of Worms for the deposition of Gregory. Heedless, or rather unconscious, of the resources of that formidable adversary, he had made no preparation for the inevitable contest; but, as if smitten by a judicial blindness, selected that critical moment for a new outrage on the most sacred feelings of his own subjects. He marched into Saxony; and there, as if in scorn of the free German spirit, erected a stern military despotism, confiscated the estates of the people, exiled their nobles, imprisoned their bishops, sold the peasants as slaves, or compelled them to labor in erecting fortresses, from which his mercenary troops might curb and ravage the surrounding country. The cry of the oppressed rose on every side from the unhappy land. It entered into the ears of the Avenger.

As Henry returned from this disastrous triumph to Utrecht, the imperial banner floated over a vast assemblage of courtiers, churchmen, vassals, ministers of justice, men-at-arms, and sutlers, who lay encamped, like some nomad tribe, round their chief, when the indignant bearing of some of his followers, and the alarmed and half-averted gaze of others, disclosed to him the awful fact, that a pontifical anathema had cast him down from his imperial state, and exiled him from the society of all Christian people. His heart fainted within him at these dismal tidings as at the sound of his own passing bell. But that heart was kingly still, and resolute either to dare or to endure, in defence of his hereditary crown. Shame and sorrow might track him to the grave, but he would hold no counsel with despair. The world had rejected him—the church had cast him out—his very mother deserted him. In popular belief, perhaps in his own, God himself had abandoned him. Yet all was not lost. He retained, at least, the hope of vengeance. On his hated adversary he might yet retaliate blow for blow, and malediction for malediction.

On Easter-day, in the year 1076, surrounded by a small and anxious circle of prelates, William

the Archbishop of Utrecht ascended his archiepiscopal throne, and recited the sacred narrative which commemorates the rising of the Redeemer from the grave. But no strain of exulting gratitude followed. A fierce invective depicted, in the darkest colors, the character and the career of Hildebrand, and with bitter scorn the preacher denied the right of such a pope to censure the Emperor of the West, to govern the church, or to live in her communion. In the name of the assembled synod, he then pronounced him excommunicate.

At that moment the summons of death reached the author of this daring defiance. While the last fatal struggle convulsed his body, a yet sorer agony affected his soul. He died self-aborred, rejecting the sympathy, the prayers, and the sacraments with which the terrified bystanders would have soothed his departing spirit. The voice of Heaven itself seemed to rise in wild concert with the cry of his tortured conscience. Thunderbolts struck down both the church in which he had abjured the Vicar of Christ, and the adjacent palace in which the emperor was residing. Three other of the anti-papal prelates quickly followed William to the grave, by strange and violent deaths. Godfrey of Lorraine fell by the hand of an assassin. Universal horror was awakened by such accumulated portents. Each day announced to Henry some new secession. His guards deserted his standard; his personal attendants avoided his presence. The members of the Synod of Worms fled to Rome, to make their peace with the justly irritated pontiff. The nobles set free the Saxon prisoners who had been confined to their custody. Otho appeared once more in arms to lead a new insurrection of his fellow-countrymen. The great princes of Germany convened a council to deliberate on the deposition of their sovereign. To every eye but his own, all seemed to be lost. Even to him it was but too evident that the loyalty of his subjects had been undermined, and that his throne was tottering beneath him. A single resource remained. He might yet assemble the faithful or the desperate adherents of his cause—inspire dread into those whose allegiance he had forfeited—make one last strenuous effort in defence of his crown—and descend to the tomb, if so it must be, the anointed and acknowledged Chief of the Carolingian Empire.

With a mind wrought up to such resolves, he traversed the north of Germany to encounter the Saxon insurgents—published to the world the sentence of Utrecht—and called on the Lombard bishops to concur in the excommunication it denounced. He reaped the usual reward of audacity. Though repelled by Otho, and compelled to retrace his march to the Rhine, he found every city, village, and convent, by which he passed, distracted with the controversy between the diadem and the tiara. Religion and awakening loyalty divided the empire. Though not yet combining into any definite form, the elements of a new confederacy were evidently at work in favor of a monarch who thus knew how to draw courage and energy from despair.

Yet the moral sentiment of the German people was as yet unequivocally against their sovereign. The imperialists mournfully acknowledged that their chief was justly condemned. The papalists indignantly denied the truth of the reproaches cast on their leader. In support of that denial,

Gregory defended himself in epistles addressed to all the greater Teutonic prelates. Among them is a letter to Herman, bishop of Metz, which vividly exhibits both the strength of the writer's character and the weakness of his cause. Although (he says) such as, from their exceeding folly, deny the papal right of excommunicating kings hardly deserve an answer, (the right to *depose* kings was the real point in debate,) yet, in condescension to their weakness, he will dispel their doubts. Peter himself had taught this doctrine, as appeared by a letter from St. Clement, (in the authenticity of which no one believes.) When Pepin coveted the crown of Childeric, Pope Zachary was invited by the mayor of the palace to give judgment between them. On his ambiguous award the usurper had founded the title of his dynasty. Saint Gregory the Great had *threatened* to depose any monarch who should resist his decrees. The story of Ambrose and Theodosius rightly interpreted, gave proof that the emperor held his crown at the will of the apostle. Every king was one of the "sheep" whom Peter had been commanded to feed, and one of the "things" which Peter had been empowered to bind. Who could presume to place the sceptre on a level with the crosier? The one the conquest of human pride, the other the gift of divine mercy: the one conducting to the vain glories of earth, the other pointing the way to heaven. As gold surpasses lead, so does the episcopal transcend the imperial dignity. Could Henry justly refuse to the universal bishop that precedence which Constantine had yielded to the meanest Prelate at Nicæa? Must not he be supreme above all terrestrial thrones, to whom all ecclesiastical dominations are subordinate?

To employ good arguments, one must be in the right. To make the best possible use of such as are to be had, is the privilege of genius, even when in the wrong. Nothing could be more convincing to the spiritual lords of Germany, nothing more welcome to her secular chiefs, than this array of great names and sonorous authorities against their falling sovereign. To overcome the obstinate loyalty of the burghers and peasantry to their young and gallant king, religious terrors were indispensable; and continual reinforcements of pontifical denunciations were therefore solicited and obtained. At length, in the autumn of 1076, appeared from Rome a rescript which, in the event (no longer doubtful) of Henry's continued resistance to the sentence of the last papal council, required the German princes and prelates, counts and barons, to elect a new emperor, and assured them of the apostolical confirmation of any choice which should be worthily made. These were no idle words. The death-struggle could no longer be postponed. Legates arrived from Rome, to guide the proceedings of the diet to be convened for this momentous deliberation. It met during the autumn at Tribur.

The annals of mankind scarcely record so solemn or so dispassionate an act of national justice. On every adjacent height some princely banner waved over the mature vintage, and joining in that pleasant toil, and in the carols of that gay season, groups of unarmed soldiers might be traced along the furthest windings of the neighboring Rhine. In the centre, and under the defence of that vast encampment, rose a pavilion, within which were collected all whose dignity entitled them to a voice in that high debate. From the only extant

record of what occurred, and of what was spoken there, it may be inferred that Henry's offences against the church were regarded lightly in comparison with the criminality of his civil government. Stationed on the opposite bank of the river, he received continued intelligence of the progress and tendency of the discussion. The prospect darkened hourly. Soldiers had already been dispatched to secure him; and unknighly indignities inflicted on his person, might forever have estranged the reverence borne to him by the ruder multitude, when he attempted to avert the impending sentence by an offer to abdicate all the powers of government to his greater feudatories, and to retreat from the contest as the merely titular head of the Teutonic Empire.

Palpable as was the snare to the subtle Italian legates, the simple-minded Germans appear to have nearly fallen into it. For seven successive days, speech answered speech on this proposal, and when men could neither speak nor listen more, the project of a nominal reign, shorn of all substantial authority, was adopted by the diet; but (in modern phrase) with amendments obviously imposed by the representatives of the sacerdotal power. The pope was to be invited to hold a diet at Augsburg in the ensuing spring. He was meanwhile to decide whether Henry should be restored to the bosom of the church. If so absolved, he was at once to resume all his beneficial rights. But if the sun should go down on him, still an excommunicate person, on the 23d of February, 1077, his crown was to be transferred to another. Till then he was to dwell at Spire, with the imperial title, but without a court, an army, or a place of public worship.

The theocratic theory, hitherto regarded as a mere Utopian extravagance, had thus passed into a practical and a sacred reality. The fisherman of Galilee had triumphed over the conqueror of Pharsalia. The vassal of Otho had reduced Otho's successor to vassalage. The universal monarchy which heathen Rome had wrung from a bleeding world, had been extorted by Christian Rome from the superstition or the reverence of mankind. The relation of the papacy and the empire had been inverted, and churchmen foretold with unhesitating confidence the exaltation of their order above all earthly potentates, and the resort to their capital of countless worshippers, there to do homage to an oracle more profound than that of Delphi, to mysteries more pure than those of Eleusis, and to a pontificate more august than that of Jerusalem. Strains of unbounded joy resounded through the papal city. Solitude and shame and penitential exercises attended the past crimes and the abject fortunes of the exile of Spire.

But against this regimen of sackcloth and fasting, the body and the soul of Henry revolted. At the close of the Diet of Tribur, he had scarcely completed his twenty-sixth year. Degraded, if not finally deposed, hated and reviled, abandoned by man, and compelled by conscience to anticipate his abandonment by God, he yet in the depths of his misery retained the remembrance and the hope of dominion. Youth could still gild the future. He might yet retrieve his reputation, resume the blessings he had squandered, and take a signal vengeance on his great antagonist. And amidst the otherwise universal desertion, there was one faithful bosom on which to repose his own aching heart. Contrasted with the guilt and the baseness

of her husband's court, Bertha is disclosed to us as the pure surrounded by the licentious, the faithful by the false. Her wrongs had been such as to render a deep resentment nothing less than a duty. Her happiness and her honor had been basely assailed by the selfish profligate to whom the most solemn vows had in vain united her. But to her, those vows were a bond stronger than death, and never to be dissolved or weakened by all the confederate powers of earth and hell. To suffer was the condition—to pardon and to love, the necessity—of her existence. Vice and folly could not have altogether depraved him who was the object of such devoted tenderness, and who at length returned it with almost equal constancy, after a bitter experience had taught him the real value of the homage and caresses of the world.

In her society, though an exile from every other, Henry wore away two months at Spire in a fruitless solicitation to the pope to receive him in Italy as a penitent suitor for reconciliation with the church. December had now arrived; and in less than ten weeks would be fulfilled the term, when, if still excommunicate, he must, according to the sentence at Tribur, finally resign, not the prerogatives alone, but the title and rank of head of the empire. To avert this danger, no sacrifice could be declined; and history tells of none more singular than those to which the heir of the Franconian dynasty was constrained to submit. In the garb of a pilgrim, and in a season so severe as during more than four months to have converted the Rhine into a solid mass of ice, Henry and his faithful Bertha, carrying in her arms their infant child, undertook to cross the Alps, with no escort but such menial servants as it was yet in his power to hire for that desperate enterprise. Among the courtiers who had so lately thronged his palace, not one would become the companion of his toil and dangers. Among the neighboring princes who so lately had solicited his alliance, not one would grant him the poor boon of a safe-conduct and a free passage through their states. Even his wife's mother exacted from him large territorial cessions as the price of allowing him and her own daughter to scale one of the Alpine passes, apparently that of the Great St. Bernard. Day by day, peasants cut out an upward path through the long windings of the mountain. In the descent from the highest summit, when thus at length gained, Henry had to encounter fatigues and dangers from which the chamois-hunter would have turned aside. Vast trackless wastes of snow were traversed, sometimes by mere crawling, at other times by the aid of rope-ladders or still ruder contrivances, and not seldom by a sheer plunge along the inclined steep; the empress and her child being enveloped on those occasions in the raw skins of beasts slaughtered on the march.

The transition from these dangers to security, from the pine forests, glaciers, and precipices of the Alps, to the sunny plains of the south, was not so grateful to the wearied travellers as the change from the gloom of Spire to the rapturous greetings which hailed their advance along the course of the Po. A splendid court, a numerous army, and an exulting populace, once more attested the majesty of the emperor; nor was the welcome of his Italian subjects destitute of a deeper significance than usually belongs to the pæans of the worshippers of kings. They dreamed of the haughty pontiff humbled, of the see of Ambrose exalted to civil and ecclesiastical supremacy, and

of the German yoke lifted from their necks. Doomed as were these soaring hopes to an early disappointment, the enthusiasm of Henry's partisans justified those more sober expectations which had prompted his perilous journey across the Alps. He could now prosecute his suit to the pope with the countenance and in the vicinity of those zealous adherents, and at a secure distance from the enemies towards whom Hildebrand was already advancing to hold the contemplated diet of Augsburg. In personal command of a military escort, Matilda attended the papal progress: and was even pointing out to her guards their line of march through the snowy peaks which closed in her northern horizon, when tidings of the rapid approach of the emperor at the head of a formidable force induced her to retreat to the fortress of Canossa. There, in the bosom of the Apennines, her sacred charge would be secure from any sudden assault. Nor had she anything to dread from the regular leaguer of such powers as could in that age have been brought to the siege of it.

Canossa was the cradle and the original seat of her ancient race. It was also the favorite residence of the great countess; and when Gregory found shelter within her halls, they were crowded with guests of the highest eminence in social and in literary rank. So imposing was the scene, and so superb the assemblage, that the drowsy muse of her versifying chaplain awakened for once to an hyperbole, and declared Canossa to be nothing less than a new Rome, the rival of that of Romulus. Thither, as if to verify the boast, came a long line of mitred penitents from Germany, whom the severe Hildebrand consigned on their arrival to solitary cells with bread and water for their fare; and there also appeared the German emperor himself, not the leader of the rumored host of Lombard invaders, but surrounded by a small and unarmed retinue—mean in his apparel, and contrite in outward aspect, a humble suppliant for pardon and acceptance to the communion of the faithful. Long centuries had passed away since the sceptre of the West had been won in Cisalpine fields fought by Italian armies; and Henry well knew that, to break the alliance of patriotism, cupidity, and superstition, which had degraded him at Tribur, it was necessary to rescue himself from the anathema which he had but too justly incurred. And Hildebrand! fathomless as are the depths of the human heart, who can doubt that, amidst the conflict of emotions which now agitated him, the most dominant was the exulting sense of victory over the earth's greatest monarch! His rival at his feet, his calumniator self-condemned, the lips which had rudely summoned him to abdicate the apostolic crown now suing to him for the recovery of the imperial diadem, the exaltation in his person of decrepid age over fiery youth, of mental over physical power, of the long-enthralled church over the long-tyrannizing world, all combined to form a triumph too intoxicating even for that capacious intellect.

The veriest sycophant of the papal court would scarcely have ventured to describe, as a serious act: of sacramental devotion, the religious masquerade which followed between the high priest and the imperial penitent; or to extol as politic and wise, the base indignities to which the pontiff subjected his prostrate enemy, and of which his own pastoral letters contain the otherwise incredible record. Had it been his object to compel Henry to drain to

its bitterest dregs the cup of unprofitable humiliation—to exasperate to madness the emperor himself, and all who would resent as a personal wrong an insult to their sovereign—and to transmit to the latest age a monument and a hatred alike imperishable, of the extravagances of spiritual despotism, he could have devised no fitter course.

Environed by many of the greatest princes of Italy who owed fealty and allegiance to the emperor, Gregory affected to turn a deaf ear to his solicitations. His humblest offers were spurned; his most unbounded acknowledgments of the sacerdotal authority over the kings and kingdoms of the world were rejected. For the distress of her royal kinsman, Matilda felt as women and as monarchs feel; but even her entreaties seemed to be fruitless. Day by day, the same cold stern appeal to the future decisions of the diet to be convened at Augsburg, repelled the suit even of that powerful intercessor. The critical point, at which prayers for reconciliation would give way to indignation and defiance, had been almost reached. Then, and not till then, the pope condescended to offer his ghostly pardon, on the condition that Henry would surrender into his hands the custody of the crown, the sceptre, and the other ensigns of royalty, and acknowledge himself unworthy to bear the royal title. This, however, was a scandal on which not even the proud spirit of the now triumphant priest dared to insist, and to which not even the now abject heart of the emperor could be induced to submit. But the shame which was spared to the sovereign was inflicted with relentless severity on the man.

It was towards the end of January, the earth was covered with snow, and the mountain streams were arrested by the keen frost of the Apennines, when, clad in a thin penitential garment of white linen, and bare of foot, Henry, the descendant of so many kings, and the ruler of so many nations, ascended slowly and alone the rocky path which led to the outer gate of the fortress of Canossa. With strange emotions of pity, of wonder, and of scorn, the assembled crowd gazed on his majestic form and noble features, as, passing through the first and the second gateway, he stood in the posture of humiliation before the third, which remained inexorably closed against his further progress. The rising sun found him there fasting; and there the setting sun left him stiff with cold, faint with hunger, and devoured by shame and ill-suppressed resentment. A second day dawned, and wore tardily away, and closed, in a continuance of the same indignities, poured out on mankind at large in the person of their chief by the vicar of the meek, the lowly, and the compassionate Redeemer. A third day came, and still irreverently trampling on the hereditary lord of the fairer half of the civilized world, Hildebrand once more prolonged till nightfall this profane and hollow parody on the real workings of the broken and contrite heart.

Nor in the midst of this outrage on every natural sentiment and every honest prejudice, was he unwarned of the activity and the strength of those feelings. Lamentations, and even reproaches, rang through the castle of Canossa. Murmurs from Henry's inveterate enemies, and his own zealous adherents, upbraided Gregory as exhibiting rather the cruelty of a tyrant than the rigor of an apostle. But the endurance of the sufferer was the only measure of the inflexibility of the tormentor; nor was it till the unhappy monarch

had burst away from the scene of his mental and bodily anguish, and sought shelter in a neighboring convent, that the pope, yielding at length to the instances of Matilda, would admit the degraded suppliant into his presence. It was the fourth day on which he had borne the humiliating garb of an affected penitence, and in that sordid raiment he drew near on his bare feet to the more than imperial majesty of the church, and prostrated himself in more than servile deference before the diminutive and emaciated old man, "from the terrible grace of whose countenance," we are told, "the eye of every beholder recoiled as from the lightning." Hunger, cold, nakedness, and shame, had for the moment crushed that gallant spirit. He wept and cried for mercy, again and again renewing his entreaties, until he had reached the lowest level of abasement to which his own enfeebled heart, or the haughtiness of his great antagonist, could depress him. Then, and not till then, did the pope condescend to revoke the anathema of the Vatican.

Cruel, however, were the tender mercies of the now exulting pontiff. He restored his fallen enemy at once to the communion and to the contempt of his Christian brethren. The price of pardon was a promise to submit himself to the future judgment of the apostolic see; to resign his crown if that judgment should be unfavorable to him; to abstain meanwhile from the enjoyment of any of his royal prerogatives or revenues; to acknowledge the validity of the release of his subjects from their allegiance; to banish his former friends and advisers; to govern his states, should he regain them, in obedience to the papal counsels; to enforce all papal decrees, and never to revenge his present humiliation. To the observance of the terms thus dictated by the conqueror, the oaths of Henry himself, and of several prelates and princes as his sponsors, were pledged; and then, in the name of Him who had declared that his kingdom was not of this world, and as the successor of him who had forbidden to all bishops any lordship over the heritage of Christ, the solemn words of pontifical absolution rescued the degraded emperor from the forfeit to which he had been conditionally sentenced by the confederates at Tribur.

Another expiation was yet to be made to the injured majesty of the tiara. He in whom the dynasties of Cæsar, of Charlemagne, and of Otto had their representative, might still be compelled to endure one last and galling contumely. Holding in his hand the seeming bread, which words of far more than miraculous power had just transmuted into the very body which died and was entombed at Calvary—"Behold!" exclaimed the pontiff, fixing his keen and flashing eye on the jaded countenance of the unhappy monarch—"behold the body of the Lord! Be it this day the witness of my innocence. May the almighty God now free me from the suspicion of the guilt of which I have been accused by thee and thine, if I be really innocent! May He this very day smite me with a sudden death, if I be really guilty!" Amidst the acclamations of the bystanders, he then looked up to heaven, and broke and ate the consecrated element. "And now," he exclaimed, turning once more on the awe-stricken Henry that eye which neither age could dim nor pity soften; "if thou art conscious of thine innocence, and assured that the charges brought against thee by thine own opponents are false and calumnious,

free the church of God from scandal, and thyself from suspicion, and take as an appeal to heaven this body of the Lord."

That in open contradiction to his own recent prayers and penances, the penitent should have accepted this insulting challenge, was obviously impossible. He trembled and evaded it. At length when his wounded spirit, and half-lifeless frame could endure no more, a banquet was served, where, suppressing the agonies of shame and rage with which his bosom was to heave from that moment to his last, he closed this scene of wretchedness, by accepting the hospitalities, sharing in the familiar discourse, and submitting to the benedictions of the man who had in his person given proofs till then unimagined, of the depths of ignominy to which the temporal chief of Christendom might be depressed by an audacious use of the powers of her ecclesiastical head.

The Lombard lords who had hailed the arrival of their sovereign in Italy, had gradually overtaken his rapid advance to Canossa. There, marshalled in the adjacent valleys, they anxiously awaited from day to day intelligence of what might be passing within the fortress, when at length the gates were thrown open, and attended only by the usual episcopal retinue, a bishop was seen to descend from the steep path which led to their encampment. He announced that Henry had submitted himself to the present discipline and to the future guidance of the pope, and had received his ghostly absolution; and that on the same terms his holiness was ready to bestow the same grace on his less guilty followers. As the tidings of this papal victory flew from rank to rank, the mountains echoed with one protracted shout of indignation and defiance. The Lombards spurned the pardon of Hildebrand—an usurper of the apostolic throne, himself excommunicated by the decrees of German and Italian synods. They denied the authority of the emperor, debased as he now was by concessions unworthy of a king, and by indignities disgraceful to a soldier. They vowed to take the crown from his dishonored head, to place it on the brows of his son, the yet infant Conrad; to march immediately to Rome, and there to depose the proud churchman who had thus dared to humble to the dust the majesty of the Franconian line and of the Lombard name.

In the midst of this military tumult, the gates of Canossa were again thrown open, and Henry himself was seen descending to the camp, his noble figure bowed down, and his lordly countenance overcast with unwonted emotions. As he passed along the Lombard lines, every eye expressed contempt, and derision was on every tongue. But the Italian was not the German spirit. They could not at once despise and obey. Following the standard of their degraded monarch, they conducted him to Reggio, where, in a conclave of ecclesiastics, he instantly proceeded to concert schemes for their deliverance, and for his own revenge.

Within a single week from the absolution of Canossa, Gregory was on his way to Mantua to hold a council, to which the emperor had invited him, with the treacherous design (if the papal historians may be credited) of seizing and imprisoning him there. The vigilance of Matilda rescued her holy father from the real or imaginary danger. From the banks of the Po she conducted him back, under the escort of her troops, to the shelter of her native mountain fastness. His faith in

his own infallibility must have undergone a severe trial. The imperial sinner he had pardoned, was giving daily proof that the heart of man is not to be penetrated even by papal eyes. Henry was exercising, with ostentation, the prerogatives he had so lately vowed to forego. He had cast off the abject tone of the confessional. All his royal instincts were in full activity. He breathed defiance against the pontiff—seized and imprisoned his legates—recalled to his presence his excommunicated councillors—became once more strenuous for his rights—and was recompensed by one simultaneous burst of sympathy, enthusiasm, and devotedness, from his Italian subjects.

To balance the ominous power thus rising against him, Gregory now received an accession of dignity and of influence on which his eulogists are unwilling to dwell. The discipline of the church, and the fate of the empire, were not the only subjects of his solicitude while sheltered in the castle and city of the Tuscan heroine. The world was startled and scandalized by the intelligence, that his princely hostess had granted all her hereditary states to her apostolic guest, and to his successors forever, in full allodial dominion. By some sage of the law, who drew up the act of cession, it is ascribed to her dread of the emperor's hostility. A nobler impulse is ascribed to the mistress of Liguria and Tuscany in the hobbling verses of her more honest chaplain. Peter, he says, bore the keys of heaven, and Matilda had resolved to bear the Etrurian keys of Peter's patrimony in no other character than that of doorkeeper to Peter. With what benignity the splendid inheritance was accepted, may also be learned from the worthy versifier. At this hour Pope Gregory the sixteenth holds some parts of his territorial dominion in virtue of this grant. Hildebrand is one of the saints of the church, and one of the heroes of the world. He, therefore, escapes the reproach of so grave an abuse of the hospitality of the great countess, and of the confidence she reposed in her spiritual guide. The coarser reproach in which it has involved them both, will be adopted by no one who has ever watched the weaving of the mystic bonds which knit together the female and the sacerdotal hearts. It was the age of feudalism, not of chivalry. Yet, when chivalry came, and St. Louis himself adorned it, would he, if so tried, have resisted the temptation under which St. Gregory fell? It is, probably, well for the fame of that illustrious prince that his virtue was never subjected to so severe a test.

Canossa, the scene of this memorable cession, was, at the same time, the prison of him to whom it was made. All the passes were beset with Henry's troops. All the Lombard and Tuscan cities were in Henry's possession. His reviving courage had kindled the zeal of his adherents. He was no longer an outcast to be trampled down with impunity, but the leader of a formidable host, with whom even the Vicar of Christ must condescend to temporize.

In the wild defiles of the Alps, swift messengers from the princes to the pope hurried past solemn legates from the pope to the princes—they urging his instant appearance at Augsburg—he exhorting them to avoid any decision in his absence. Mired emissaries also passed from Gregory to the emperor, summoning him to attend the diet within a time by which no one unwasted by wings or steam could have reached the place, and requesting from him a suicidal safe-conduct for his pontifical judge. The pope was now confined to the weapons with

which men of the gown contend with men of the sword. His prescience forebode a civil war. His policy was to assume the guidance of the German league just far enough to maintain his lofty claims, not far enough to be irrevocably committed to the leaguers. A plausible apology for his absence was necessary. It was afforded by Henry's rejection of demands made only that they might be rejected.

To Otho and to the aspiring Rudolf such subtleties were alike unfamiliar and unsuspected. Those stout soldiers and simple Germans knew that the pope had deposed their king and had absolved them from their allegiance. They doubted not, therefore, that he was bound heart and soul to their cause. Or if, in the assembly which they held at Forcheim, a doubt was whispered of Italian honor or of pontifical faith, it was silenced by the presence there of papal legates, who sedulously swelled the tide of invective against Henry. At first, indeed, they dissuaded the immediate choice of a rival sovereign. But to the demand of the princes for prompt and decisive measures, they gave their ready assent. They advised them, it is true, to confer no hereditary title on the object of their choice. Yet when, in defiance of that advice, the choice was made, they solemnly confirmed it in the name, and by the authority, of Gregory. They did not, certainly, vote for the election of Rudolf; but, when the shouts of the multitude announced his accession to the Teutonic throne, they placed the crown on his head. That Hildebrand did not disavow these acts of his representatives, but availed himself of the alliances and aids to be derived from them, appeared, to these downright captains, abundantly sufficient to bind him in conscience and in honor. That the pope had not the slightest intention of being so bound, unless it should chance to suit his own convenience, is, however, past dispute. Even in the nineteenth century he has found, in M. l'Abbé Jager, an apologist who absolves him from all responsibility for the acts of his legates at the Diet of Forcheim, because they were adopted without awaiting his own personal arrival. The diet might just as reasonably have awaited the arrival of the millennium.

The decretals of Rome, of Tribur, of Canossa, and of Forcheim, were now to bear their proper fruits—fruits of bitter taste and of evil augury. At the moment when the cathedral of Mentz was pouring forth the crowds who had just listened to the coronation oath of Rudolf, the clash of arms, the cries of combatants, and the shrieks of the dying, mingled, strangely and mournfully, with the sacred anthems and the songs of revellers. An idle frolic of some Swabian soldiers had kindled into rage the sullen spirit with which the partisans of Henry had gazed on that unwelcome pageant; and the first rude and exasperated voice was echoed by the thousands who learned, from those acclamations, the secret of their numbers and their strength. The discovery and the agitation spread from city to city, and roused the whole German people from the Rhine to the Oder. Men's hearts yearned over their exiled king. They remembered that, but twelve short years before, he had been basely stolen from his mother by churchmen who had yet more basely corrupted him. They commemorated his courage, his courtesy and his munificence. They pardoned his faults as the excesses of youth, and resented, as insults to themselves, the indignities of Canossa and the treason of Forcheim. In this reflux of

public opinion, the loyal and the brave, all who cherished the honors of the crown, and all who desired the independence of the state, were supported by the multitudes to whom the papal edicts against simony and clerical marriages were fraught with calamity, and by that still more numerous body who at all times lend their voices and their arms to swell the triumph of every rising cause. To this confederacy Rudolf had to oppose the alliance of the princes, secular and ecclesiastical, the devoted zeal of the Saxon people, and the secret support, rather than the frank and open countenance, of the pope. The shock of these hostile powers was near and inevitable.

In the spring of 1077, tidings were spread throughout Germany of the emperor's arrival to the northward of the Alps. From Franconia, the seat of his house, from the fruitful province of Burgundy, and from the Bohemian mountains, he was greeted with an enthusiastic welcome. Many, even of the Bavarians and Swabians, revolted in his favor. His standard once more floated over all the greater citadels of the Rhine. He who, six months before, had fled from Spire, a solitary wanderer, was now at the head of a powerful army, controlling the whole of southern Germany, laying waste the territories of his rivals, and threatening them with a signal retribution.

Amidst the rising tempest the voice of Gregory was heard; but it was no longer trumpet-tongued and battling with the storm. The Supreme Earthly Judge, the dread avenger, had subsided into the pacific mediator. In the name of Peter he enjoined either king to send him a safe-conduct, that he might, in person, arbitrate between them and stop the effusion of Christian blood. A safe but an impracticable offer; an indirect but significant avowal of neutrality between the sovereign he had so lately deposed, and the sovereign whom, by his legates, he had so lately crowned. Thus ignobly withdrawing from the contest he had so precipitately kindled, Hildebrand returned from Canossa to the papal city. The great countess, as usual, attended as the commander of his guard. Rome received in triumph her new Germanicus, and decreed an ovation to his ever-faithful Agripina.

While the glories of Canossa were thus celebrated by rejoicings in the Christian capital, these were expiated by blood in the plains of Saxony. Confiding in the solemn acts of the pope and his legates, the Saxons had thronged to the defence of the crown of Rudolf, and they had sustained it undauntedly. But the bravest quailed at the intelligence that Gregory had disowned the cause of the church, and of their native land; and that, even in the palace of the Lateran, the ambassadors of Henry were received with honors and with a deference denied to the humbler envoys of his rival. Sagacity far inferior to that of Hildebrand, could, at that time, have divined that the sword alone could decide such a quarrel—that the sword of Henry was the keener of the two—and that, by the cordial adoption of the cause of either, the pope might draw on himself the vengeance of the conqueror. To pause, to vacillate, and to soothe, had, therefore, become the policy of the sovereign of the papal states; but to be silent or inactive in such a strife, would have been to abdicate one of the highest prerogatives of the papacy. Pontifical legates traversed Europe. Pontifical epistles demanded the submission of the combatants. Pontifical warnings denounced woes on the disobedient.

But no pontifical voice explained who was to be obeyed or who opposed, what was to be done or what forborne. Discerning readers of these mandates understood them as an intimation that, on the victorious side, (whichever that side might be,) the pontifical power would ultimately be found.

The appeal from these dark oracles to the unambiguous sword was first made by the rival kings in the autumn of 1078. They met on the banks of the Stren, on the plains of Melrichstadt. Each was driven from the field with enormous loss; Henry by his inveterate antagonist Otho; Rudolf by Count Herbard, the lieutenant of Henry. Each claimed the victory. An issue so indecisive could draw from the circumspect pontiff nothing more definite than renewed exhortations to rely on the Holy Peter; and could urge him to no measure more hazardous than that of convening a new council at the Lateran. There appeared the imperial envoys with hollow vows of obedience, and Saxon messengers invoking some intelligible intimation of the judgment and purposes of the apostolic see. Again the pope listened, spoke, exhorted, threatened, and left the bleeding world to interpret, as it might, the mystic sense of the Infallible.

To that brave and truth-loving people, from whom, at the distance of four centuries, Luther was to rise for the deliverance of mankind, these subtleties appeared in their real light. The Saxon annalist has preserved three letters sent by his countrymen on this occasion to Gregory, which he must have read with admiration and with shame. "You know, and the letters of your holiness attest" (such is their indignant remonstrance) "that it was by no advice nor for any interest of ours, but for wrongs done to the holy see, that you deposed our king, and forbade us, under fearful menaces, to acknowledge him. We have obeyed you at great danger, and at the expense of horrible sufferings. Many of us have lost their property and their lives, and have bequeathed hopeless poverty to their children. We who survive are without the means of subsistence, delivered over to the utmost agonies of distress. The reward of our sacrifices is, that he who was compelled to cast himself at your feet has been absolved without punishment, and has been permitted to crush us to the very abyss of misery. After our king had been solemnly deposed in a synod, and another chosen in virtue of the apostolic authority, the very matter thus decided is again brought into question. What especially perplexes us simple folk is, that the legates of Henry, though excommunicated by your legates, are well received at Rome. Holy father, your piety assures us that you are guided by honorable, not by subtle views; but we are too gross to understand them. We can only explain to you that this management of two parties has produced civil war, murder, pillage, conflagration. If we helpless sheep had failed in any point of duty, the vengeance of the holy see would have overtaken us. Why exhibit so much forbearance, when you have to do with wolves who have ravaged the Lord's fold! We conjure you to look into your own heart, to remember your own honor, to fear the wrath of God, and for your own sake, if not for love of us, rescue yourself from the responsibility for the torrents of blood poured out in our land."

To these pathetic appeals Gregory answered

slowly and reluctantly; by disavowing the acts of his legates at Forcheim; by extolling his own justice, courage, disinterestedness; by invoking the support of all orders of men in Germany; and by assuring them, in scriptural language, of the salvation of such "as should persevere to the end." But the hour for blandishments had passed away. The day of wrath and the power of the sword had come.

The snow covered the earth, and the frost had chained the rivers, when in the winter of 1079-80, the armies of Henry and Rudolf were drawn up, in hostile lines, at the village of Fladenheim near Mulhausen. Henry was the assailant, but, though driven with great loss from the field, Rudolf was the conqueror; for in that field the dreaded Otho again commanded, and by his skill and courage a rout was turned into a victory.

The intelligence arrived at Rome at the moment when Gregory was presiding there in the most numerous of the many councils he had convened at the Lateran. Long-suppressed shame for his ignoble indecision, the murmurs of the assembled prelates, a voice from heaven, audible, as we are told, to his sense alone, and above all the triumphant field of Fladenheim, combined to overcome his long-cherished but timid policy. Rising from his throne with the majesty of his earlier days, the pope, in the names of Peter and of Paul, "of God and of his holy mother Mary," excommunicated Henry, took from him the government of his states, deprived him of his royal rank, forbade all Christian people to receive him as their king, "gave, granted, and conceded," that Rudolf might rule the German and Italian empire, and with blessings on Rudolf's adherents, and curses on his foes, dissolved the assembly. Then moved, as he believed, by a divine impulse, he proceeded to the altar, and uttered a prediction, that ere the church should celebrate the festival of the prince of the apostles, Henry, her rebellious outcast, should neither reign nor live to molest her.

A perilous prophecy. Henry was no longer the exile of Tribur nor the penitent of Canossa. His own rage, on hearing of this new papal sentence, did not burn so fiercely as the wrath of his adherents. With the sanction of thirty bishops, a new anti-pope, Guibert of Ravenna, was elected at Brixen; and, at every court in Europe, imperial embassies demanded support for the common cause of all temporal sovereigns. In every part of Germany troops were levied, and Henry marched at their head to crush the one Cisalpine power in alliance with Rome. But that power was still animated by the Saxon spirit, and was still sustained by the claims of Rudolf and by the genius of Otho.

On the bright dawn of an autumnal day, his forces, drawn up on the smiling banks of the Elster, raised the sacred song of the Hebrews, "God standeth in the congregation of princes; he is a judge among Gods;" and flung themselves on the far extended lines of Henry's army; who, with emulous devotion, met them with the hardly less sublime canticle, "Te Deum laudamus." Cries more welcome to the demons of war soon stilled these sacred strains—cries of despair, of anguish, and of terror. They first rose from one of Henry's squadrons, which, alarmed by the fall of their captain, receded, and, in their retreat, spread through the rest a panic, a pause, and a momentary confusion. That moment was enough

for the eagle glance of Otho. He rushed on the wavering imperialists, and, ere that bright sun had reached the meridian, thousands had fallen by the Saxon sword, or had perished in the blood-stained river. The victory was complete, the exultation rapturous. Shouts of glory to the God of battles, thanksgivings for the deliverance of Saxony, pæans of immortal honor to Otho, the noblest of her sons, soothed or exasperated the agonies of the dying, when the triumph was turned into sudden and irremediable mourning. On the field which had, apparently, secured his crown, Rudolf himself had fallen. He fell by an illustrious arm. Godfrey of Bouillon, the hero of the *Jerusalem Delivered*, struck the fatal blow. Another sword severed the right hand from the arm of Rudolf. "It is the hand," he cried, as his glazing eye rested on it, "with which I confirmed my fealty to Henry my lord." At once elevated by so signal a victory, and depressed by these penitent misgivings, his spirit passed away, leaving his adherents to the mercy of his rival.

The same sun which witnessed the ruin of Henry's army on the Elster, looked down on a conflict, in which, on that eventful morning, the forces of Matilda in the Mantuan territory fled before his own. He now, once more, descended into Italy. He came, not, as formerly, a pilgrim and an exile; but at the head of an army devoted to his person, and defying all carnal enemies and all spiritual censures. He came to encounter Hildebrand, destitute of all Transalpine alliances, and supported, even in Italy, by no power but that of Matilda: for the Norman Duke of Apulia was far away attempting the conquest of the Eastern capital and empire. But Henry left, in his rear, the invincible Saxons and the hero who commanded them. To prevent a diversion in that quarter, the emperor proposed to abdicate his dominion in Saxony in favor of Conrad, his son. But Otho (a merry talker, as his annalist informs us) rejected the project with the remark, that "the calf of a vicious bull usually proved vicious." Leaving, therefore, this implacable enemy to his machinations, the emperor pressed forward; and before the summer of 1080, the citizens of Rome saw, from their walls, the German standards in hostile array in the Campagna.

In the presence of such danger, the gallant spirit of the aged pope once more rose and exulted. He convened a synod to attest his last defiance of his formidable enemy. He exhorted the German princes to elect a successor to Rudolf. In letters of impassioned eloquence, he again maintained his supremacy over all the kings and rulers of mankind. He welcomed persecution as the badge of his holy calling; and, while the besiegers were at the gates, he disposed (at least in words) of royal crowns and distant provinces. Matilda supplied him with money, which, for a while, tranquillized the Roman populace. He himself wrought miracles to extinguish conflagrations kindled by their treachery. In language such as martyrs use, he consoled the partners of his sufferings. In language such as heroes breathe, he animated the defenders of the city. The siege, or blockade, continued for three years uninterrupted, except when Henry's troops were driven, by the deadly heats of autumn, to the neighboring hills. Distress, and, it is alleged, bribery, at length subdued the courage of the garrison. On every side clamors were heard for peace; for Henry demanded, as the terms of peace, nothing

more than the recognition of his imperial title, and his coronation by the hands of Gregory. The conscience, perhaps the pride, of Gregory revolted against the proposal. His invincible will opposed and silenced the outcries of the famished multitudes; nor could their entreaties, or their threats, extort from him more than a promise that, in the approaching winter, he would propose the question to a pontifical synod. It met, by the permission of Henry, on the 30th November, 1082. It was the latest council of Gregory's pontificate. A few bishops, faithful to their chief and to his cause, now occupied the seats so often thronged by mitred churchmen. Every pallid cheek and anxious eye was turned to him who occupied the loftier throne in the centre of that agitated assembly. He rose, and the half-uttered suggestions of fear and human policy were hushed into deep stillness as he spoke. He spoke of the glorious example, of the sacred duty, of the light affliction, and of the eternal reward, of martyrs for the faith. He spoke, as dying fathers speak to their children, of peace, and hope, and of consolation. But he spoke also, as inspired prophets spake of yore to the Kings of Israel, denouncing the swift vengeance of Heaven against his oppressors. The enraptured audience exclaimed that they had heard the voice of an angel, not of a man. Gregory dismissed the assembly, and calmly prepared for whatever extremity of distress might await him.

It did not linger. In the spring of 1084 the garrison was overpowered, the gates were thrown open to the besiegers, and Gregory sought a precarious refuge in the Castle of St. Angelo. He left the great Church of the Lateran as a theatre for the triumph of his antagonist and his rival. Seated on the apostolic throne, Guibert, the anti-pope of Brixen, was consecrated there by the title of Clement the Third; and then, as the successor of Peter, he placed the crown of Germany and of Italy on the brows of Henry and of Bertha as they knelt before him.

And now Henry had in his grasp the author of the shame of Canossa, of the anathemas of the Lateran, and of the civil wars and rebellions of the empire. The base populace of Rome were already anticipating, with sanguinary joy, the humiliation, perhaps the death, of the noblest spirit who had reigned there since the slaughter of Julius. The approaching catastrophe, whatever might be its form, Gregory was prepared to meet with a serene confidence in God, and a haughty defiance of man. A few hours more, and the castle of St. Angelo must have yielded to famine or to assault, when the aged pope, in the very agony of his fate, gathered the reward of the policy with which he had cemented the alliance between the papacy and the Norman conquerors of the south of Italy. Robert Guiscard, returning from Constantinople, flew to the rescue of his Suzerain. Scouts announced to Henry the approach of a mighty host, in which the Norman battle-axe and the cross were strangely united with the Saracenic cimeter and the crescent. A precipitate retreat scarcely rescued his enfeebled troops from the impending danger. He abandoned his prey in a fever of disappointment. Unable to slake his thirst for vengeance, he might allay it by surprising the Great Countess, and overwhelming her forces, still in arms in the Modenese. But he was himself surprised in the attempt by her superior skill and vigilance. Shouts for St. Peter and

Matilda roused the retreating imperialists by night, near the Castle of Sorbaria. They retired across the Alps with such a loss of men, of officers, and of treasure, as disabled them from any further enterprises.

The emperor returned into Germany to reign undisturbed by civil war; for the great Otho was dead, and Herman of Luxemburg, who had assumed the imperial title, was permitted to abdicate it with contemptuous impunity. Henry returned, however, to prepare for new conflicts with the papacy—to drain the cup of toil, of danger, and of distress—and to die, at length, with a heart broken by the partricial cruelty of his son. No prayers were said, and no requiem sung, over the unhallowed grave which received the bones of the excommunicated monarch. Yet they were committed to the earth with the best and the kindest obsequies. The pity of his enemies, the lamentation of his subjects, and the unbidden tears of the poor, the widows, and the orphans, who crowded round the bier of their benefactor, rendered his tomb not less sacred than if blessed by the united prayers of the whole Christian Episcopacy. Those unbribed mourners wept over a prince to whom God had given a large heart and a capacious mind; but who had derived from canonized bishops a corrupting education, and from too early and too unchecked prosperity the development of every base and cruel appetite; but to whom calamity had imparted a self-dominion from which none could withhold his reverence, and an active sympathy with sorrow to which none could refuse his love.

With happier fortunes, as, indeed, with loftier virtues, Matilda continued, for twenty five years, to wage war in defence of the apostolic see. After a life which might seem to belong to the province of romance rather than of history, she died at the age of seventy-five, bequeathing to the world a name second, in the annals of her age, to none but that of Hildebrand himself.

To him the Norman rescue of the papal city brought only a momentary relief. He returned in triumph to the Lateran. But, within a few hours, he looked from the walls of that ancient palace on a scene of woe such as, till then, had never passed before him. A sanguinary contest was raging between the forces of Robert and the citizens attached to Henry. Every street was barricaded, every house had become a fortress. The pealing of bells, the clash of arms, cries of joy, and shrieks of despair, assailed his ears in dismal concert. When the sun set behind the Tuscan hills on this scene of desolation, another light, and a still more fearful struggle, succeeded. Flames ascended at once from every quarter. They leaped from house to house, enveloping and destroying whatever was most splendid or most sacred in the edifices of mediæval Rome. Amidst the roar of the conflagration they had kindled, and by its portentous light, the fierce Saracens and the ruthless Northmen revelled in plunder, lust, and carnage, like demons by the glare of their native pandemonium. Gregory gazed with agony on the real and present aspect of civil war. Perhaps he thought with penitence on the wars he had kindled beyond the Alps. Two thirds of the city perished. Every convent was violated, every altar profaned, and multitudes driven away into perpetual and hopeless slavery.

Himself a voluntary exile, Gregory sought, in the castle of Salerno, and under the protection of

the Normans, the security he could no longer find among his own exasperated subjects. Age and anxiety weighed heavily upon him. An unwonted lassitude depressed a frame till now incapable of fatigue. He recognized the summons of death, and his soul rose with unconquerable power to entertain that awful visitant. He summoned round his bed the bishops and cardinals who had attended his flight from Rome. He passed before them, in firm and rapid retrospect, the incidents of his eventful life. He maintained the truth of the great principles by which it had been governed from the commencement to the close. He named his three immediate successors in the papacy. He assured his weeping friends of his intercession for them in heaven. He forgave, and blessed, and absolved his enemies, though with the resolute exceptions of the emperor and the anti-pope. He then composed himself to die. His faltering lips had closed on the transubstantiated elements. The final unction had given assurance that the body, so soon to be committed to the dust, would rise again in honor and in incorruption. Anxious to catch the last accents of that once oracular voice, the mourners were bending over him, when, struggling in the very grasp of death, he collected for one last effort, his failing powers, and breathed out his spirit with the indignant exclamation—"I have loved righteousness and hated iniquity, and therefore I die in exile."

It was not permitted, even to the genius of Hildebrand, to condense, into a single sentence, an epitome of such a life as his. It was a life scarcely intelligible to his own generation, or to himself, nor indeed to our age, except by the light of that ecclesiastical history in which it forms so important an era.

It had ill beseemed the inspired wisdom of the tent-maker of Tarsus, and of the Galilean fishermen, to have founded on any other than a popular basis a society destined to encounter the enmity of the dominant few by the zeal of the devoted many. From the extant monuments of their lives and writings, it accordingly appears that they conceded to the lay multitude an ample share in the finance, the discipline, and the legislation of the collective body. The deacons were the tribunes of the Christian people. This was the age of Proletyism.

In the sad and solemn times which followed, ecclesiastical authority became austere and arbitrary, and submission to it enthusiastic. Martyrs, in the contemplation of mortal agonies and of an opening paradise, had no thoughts for the adjustment and balancing of sacerdotal powers. They who braved the wild beasts of the amphitheatre, or the ascetic rigors of the wilderness, were the heroes of the church. The rest sunk into a degraded caste. But all laid bare their souls at the confessional. All acknowledged a dominion which, discountenanced by the state, sustained itself by extreme and recondite maxims of government. In virtue of such maxims, the episcopal order encroached on every other. The vicarious attributes of Deity were ascribed to those who ministered at the altar. There, and at the font, gifts of inestimable price were laid, in popular belief, at the disposal of the priest, whose miracles, though unattested by sense or consciousness, threw into the shade the mightiest works of Moses and of Christ. This was the age of Persecution.

Heretics arose. To refute them from the sacred text was sometimes difficult, always hazardous.

It was easier to silence them by a living authority. The bishops came forth as the elect depositories of an unwritten code. Tradition became the rule of the Christian world. It might crush the errors of Arius—it might sustain the usurpations of Ambrose. This was the age of Controversy.

Constantine saw the miraculous cross, and worshipped. He confirmed to the Christian hierarchy all their original and all their acquired powers. This was the age of the Church and State Alliance.

The seat of empire was transferred from the Tiber to the Bosphorus. The Roman bishop and clergy seized on the vacant inheritance of abdicated authority. The pope became the virtual sovereign of the Roman city. The Greeks and Latins became ecclesiastical rivals. Then was first heard the Roman watch-word and rallying cry of the visible unity of the church. This was the age of Papal Independence.

Goths, Vandals, Huns, Bulgarians, Franks, and Lombards, conquered the dominions of Cæsar. But they became the converts and tributaries of Peter. The repulse of the Saracens by Charles Martel gave to Europe a new empire, to the church a second Constantine. This was the age of Barbaric Invasion.

Europe became one vast assemblage of military states. The lands were everywhere partitioned by the conquerors among their liegemen, who, having bound themselves to use their swords in their lords' defence, imposed a similar obligation on their own tenants, who, in turn, exacted it from their subordinate vassals. This was the age of Feudalism and of Hildebrand.

He ascended the apostolic throne, therefore, armed with prescriptions in favor of the loftiest claims of the hierarchy, thus reaching back almost to the apostolic times. But he found in the papal armory other weapons scarcely less keen, though of a more recent fabric. Of these the most effective were the intimate alliance of the Roman See with the monastic orders, and the reappearance, in theological debate, of that mystic word which, seven centuries before, had wrought such prodigies at Nicæa. He who first taught men to speak of a hypostatic change beneath unchanging forms, may have taught them to talk nonsense. But though he added little or nothing to the received doctrine of the church, he made an incalculable addition to the sacerdotal power.

To grasp, to multiply, and to employ these resources in such a manner as to render the Roman pontiff the suzerain of the civilized world, was the end for which Hildebrand lived—an unworthy end, if contrasted with the high and holy purposes of the gospel—an end even hateful, if contrasted with the free and generous spirit in which the primitive founders of the church had established and inculcated her liberties—yet an end which might well allure a noble spirit in the eleventh century, and the attainment of which (so far as it was attained) may be now acknowledged to have been conducive, perhaps essential, to the progress of Christianity and civilization.

To the spiritual despotism of Rome in the middle ages may, indeed, be traced a long series of errors and crimes, of wars and persecutions. Yet the papal dynasty was the triumphant antagonist of another despotism the most galling, the most debasing, and otherwise the most irremediable, under which Europa had ever groaned. The centralization of ecclesiastical power more than balanced the isolating spirit of the feudal oligarchies.

The vassal of Western, and the serf of Eastern Europe, might otherwise, at this day, have been in the same social state, and military autocracies might now be occupying the place of our constitutional or paternal governments. Hildebrand's despotism, with whatever inconsistency, sought to guide mankind, by moral impulses, to a more than human sanctity. The feudal despotism with which he waged war, sought, with a stern consistency, to degrade them into beasts of prey or beasts of burden. It was the conflict of mental with physical power, of literature with ignorance, of religion with injustice and debauchery. To the popes of the middle ages was assigned a province, their abandonment of which would have plunged the church and the world into the same hopeless slavery. To Pope Gregory the Seventh were first given the genius and the courage to raise himself and his successors to the level of that high vocation.

Yet Hildebrand was the founder of a tyranny only less odious than that which he arrested, and was apparently actuated by an ambition neither less proud, selfish, nor reckless, than that of his secular antagonists. In the great economy of Providence human agency is ever alloyed by some base motives; and the noblest successes recorded by history, must still be purchased at the price of some great ultimate disaster.

To the title of the Czar Peter of the Church conferred on him by M. Guizot, Hildebrand's only claim is, that by the energy of his will he moulded her institutions and her habits of thought to his own purposes. But the Czar wrought in the spirit of an architect who invents, arranges, and executes his own plan: Hildebrand in the spirit of a builder, erecting by the divine command a temple of which the divine hand had drawn the design and provided the materials. His faith in what he judged to be the purposes and the will of Heaven, were not merely sublime but astounding. He is everywhere depicted in his own letters the habitual denizen of that bright region which the damps of fear never penetrate, and the shadows of doubt never overcast.

To extol him as one of those Christian stoics whom the wreck of worlds could not divert from the straight paths of integrity and truth, is a mere extravagance. His policy was imperial: his resources and his arts sacerdotal. Anathemas and flatteries, stern defiance and subtle insinuations, invective such as might have been thundered by Genserich, and apologies such as might have been whispered by Augustulus, succeed each other in his story, with no visible trace of hesitation or of shame. Even his professed orthodoxy is rendered questionable by his conduct and language towards Berengarius, the great opponent of transubstantiation. With William of England, Philip of France, and Robert of Apulia, and even with Henry of Germany, he temporized at the expense of his own principles as often as the sacrifice seemed advantageous. "Nature gave horns to bulls:" to aspiring and belligerent churchmen she gave dissimulation and artifice.

Our exhausted space forbids the attempt to analyze or delineate the character of the great founder of the spiritual despotism of Rome. His acts must stand in place of such a portraiture. He found the papacy dependent on the empire: he sustained her by alliances almost commensurate with the Italian Peninsula. He found the papacy electoral by the Roman people and clergy: he left

it electoral by a college of papal nomination. He found the emperor the virtual patron of the Holy See: he wrested that power from his hands. He found the secular clergy the allies and dependents of the secular power: he converted them into the inalienable auxiliaries of his own. He found the higher ecclesiastics in servitude to the temporal sovereigns: he delivered them from that yoke to subjugate them to the Roman Tiara. He found the patronage of the church the mere desecrated spoil and merchandise of princes: he reduced it within the dominion of the supreme pontiff. He is celebrated as the reformer of the impure and profane abuses of his age: he is more justly entitled to the praise of having left the impress of his own gigantic character on the history of all the ages which have succeeded him.

From the Britannia.

THE STRENGTH OF ENGLAND.

It is a memorable characteristic of English history that, from the period of the Reformation—that period in which England first assumed the rank of a great kingdom—all the leading questions of her public life have been connected with religion. There is no such feature in the history of the continental kingdoms. After the first struggles of the Reformation, religion was superseded by politics, and politics themselves quickly sank from the public view under the shade of despotism. But in England religion was the perpetual object of popular inquiry, popular interest, and popular privileges. It mingled with every feature of public freedom; it influenced every advance of the national mind; it urged, sustained, and guided every step of that general progress which raised a feeble country into imperial power, which invested an island with dominion in every quarter of the globe, and which gave an authority to English opinion, exercising an unlimited control over the opinion of universal mankind.

These statements are undeniable; they are historic facts; they are the solid testimonials of time; and the conclusion is equally legitimate—that it has pleased the Great Disposer of all things to raise up England at once as a proof of providential protection, as the depository of divine truth, and as the champion of pure religion in all the assaults and corruptions of its enemies.

The principle of this religious existence is so effective, that its presence or absence shapes the whole history of England since it became a kingdom. From the accession of the first William to the reign of Henry VIII., the era of the Reformation, England was utterly popish. Its history was thus a succession of tyrannies. The country was convulsed with civil wars, or exhausted by foreign expeditions, equally wasteful, bloody, and useless. But, from the period of the Reformation, England rose into sudden strength. The throne still had difficulties to encounter, but they were gradually broken down; the progress was never retarded; the horizon was continually widening. It is not less remarkable, that this perpetual progress was less probable in the existence of England than of any other country. We can easily conjecture the progress of a continental power, with Europe open before it, and the boundaries of kingdoms ready to vanish before the march of its armies: but the boundaries of an island are prescribed by the hand of nature. Yet, at this hour, the territories ruled by this island are

of greater magnitude, and that magnitude acquired within a single century, than the whole Roman empire, the consolidation of a thousand years. One deep and melancholy interruption of her progress is recorded in the reign of the unfortunate Charles I. But that interruption gives only a new force to the fact, that the whole being of English freedom and prosperity depends upon religion. From the days of Elizabeth to our own all the great questions of the state have been especially religious. In the reign of William III. Popery was wholly excluded from the legislature. From that moment the country felt itself relieved of a weight which, even under the vigorous reign of Elizabeth, and the politic reign of James, had heavily encumbered its movements. From that act it seemed to have begun a new existence. From the hour when papists were suffered no more to corrupt the councils, deform the legislative countenance, and enfeeble the national vigor, purity, and independence of Protestantism, England sprang up like a "giant refreshed." Even the separation of the American colonies became a source of additional prosperity; and, instead of the drain of millions of British treasure, in supplying the financial exhaustion and guarding the frontiers of a new continent, America has been made the source of a perpetual supply of wealth and production to England.

But the most instructive feature of this history of perpetual religious impulse is, that it has been a perpetual controversy with Romanism. The various sectaries have troubled the peace of the church; but from the days of the second Charles they have never menaced either its power or its existence. Popery has done both. It is against Popery that the Church of England was raised as the national bulwark. Popery is the true peril; and the day which shall see the Church of England relax the most determined and principled resistance to Popery will see that church undone, the constitution mortally wounded, and the country preserving only strength enough to entomb them both, with useless tears and ignominious regrets, till it follows them to the grave.

But the ministerial cry is, "Maynooth must be endowed—we are pledged to it by the terms of the union." This is untrue. There was no such pledge at the union, nor at any other time. The grant has been repeatedly the subject of discussion since, and this pledge was never allowed. The grant has even been occasionally diminished. Other grants, made before the union, have been diminished, modified, and even extinguished. The grants to the Kildare-street schools, the grant to the Dublin Society, with a variety of local grants, have undergone constant changes; but no one argued their continuance on the pledge of the union. Even if the pledge had been given, did it authorize the increase of the grant? Or why is Parliament to support Popery at an expense which it never bestowed on Protestantism? Where is the vote for Oxford or Cambridge? Where is the £28,000 for enabling the sons of Protestants to be educated in a university? Where is the bounty to allure young men into Protestant orders? Not a shilling.

The next step will be to pay the Popish priesthood. This is to be justified to the Protestant by a piece of subtlety, at which Popery laughs already. "Pay the priests, and we shall separate them from the peasantry; they will lose the influence which superstition gives them; the priests

will be forgotten, and the peasantry will turn Protestant." And this is the argument addressed to a rational people! Who can doubt that the popish priest would be only the more excited to clamor by finding what clamor has already produced! That he will still keep up his closeness of connection with the populace is evident, from the incessant ceremonies forming the ritual of Rome; and that more money will give him, as it gives every one else, more power; that he will have more chapels, more pompous ceremonies, more of all the means which corrupt, or dazzle, or mislead the multitude.

If Popery shall be once endowed, it will be the established religion of Ireland. The advance is already made; another step and the evil is completed. Infatuation can go no further. Ireland will be popish and will be lost. In what shape divine vengeance will come is beyond our foresight to know; but it has been hitherto unfeeling, and it will not spare us, when it is called down by an act of Protestant guilt, more gratuitous, more headlong, and more contemptuous, than all in the history of the empire.

SLAVERY AND THE SLAVE TRADE.

A CURIOUS correspondence between the British and Foreign Anti-Slavery Society and the Foreign Office, on the "right of search," has just appeared. It is remarkable for the naked manner in which the society denounce the present means of attempting to put down the slave-trade.

Their letter is signed, "On behalf of the committee, Thomas Clarkson, President," and is dated on the 1st of March, 1845. It points out that the society has always looked to the abolition of slavery as the only means of annihilating the slave-trade, and has therefore "never countenanced the suppression of the slave-trade by an armed force." "The history of the traffic for many years past abundantly proves 'the inefficiency, not to say impolicy, of that mode of suppression.'" The treaties for the purpose are defective; are rendered a dead letter by the positive bad faith of foreign powers; are impracticable, on account of the extent of the coast to be watched; and while the armed force is maintained at an immense cost, its use has aggravated the horrors of the traffic. "Governments may enter into negotiations, engage in treaties, enact laws, and promulgate ordinances for the abolition of the slave-trade; but the experience of thirty years has proved that all will be in vain if they are not in unison with the feelings and not supported by the opinions of the people themselves. What then is to be done? The committee would respectfully reply, direct all your energies and influence against the system of slavery." "An opportunity is now afforded." "France asks to be relieved from the right of search: in her case the equivalent should be the complete and immediate abolition of slavery in her colonial possessions. This would be a guarantee—the best guarantee which could be given—that her flag should not be surreptitiously employed in feeding them at least with slaves. And in asking this great act of justice and mercy from France, no indignity would be offered; for her government, her legislative chambers, and her people, have resolved that the abolition of slavery shall take place. It is then simply a question of time. Let that be fixed; and the day

which proclaims freedom to the unfortunate slave, in Martinique and Guadalupe, in Bourbon and Cayenne, in Senegal and Algiers, be the epoch fixed for the abandonment of the right of search."

Lord Aberdeen replies through his under secretary, Viscount Canning. He expresses concurrence in much that the society say, and promises "respectful consideration" of the suggestion made; but he denies that the past course has been without good fruit. Portugal has of late executed in good faith the treaty of 1842; Spain has "redeemed the engagement of the treaty taken in 1835, for the enactment of a penal law of great severity against the slave-trade;" "and, though the unhappy beings yearly landed on the coast of Brazil may still be reckoned by thousands, the increasing demand for labor in that country places it beyond all doubt, that but for the operation of British cruisers, the numbers would have been many times multiplied." "But the influence of one country upon the domestic institutions of another, those institutions being recognized and upheld by the laws, and closely interwoven with the habits and interests of the people, can rarely be otherwise than slow and uncertain; and it becomes a matter of grave consideration, whether, in the hope of being able to contribute to the eventual abolition of slavery in Cuba and Brazil, the government of England would do wisely to abandon those means of direct action against the slave-trade, which, though far from complete in their operation, have not been without their good effect, and are likely, as Lord Aberdeen confidently trusts, to gain in efficiency."

[It is remarkable, that, if the society are so confident of the impolicy of the armed suppression, they do not at once propose to give up what is positively bad, without waiting to exact ulterior conditions. Such course would much facilitate the solution of all such questions of international morals.]—*Spectator*, 5 April.

The Æneid of Virgil. With English Notes, by CHARLES ANTHON, LL. D., Professor of Greek and Latin in Columbia College, and Rector of the Grammar School, New York. Edited by J. R. Major, D. D., Head Master of King's College School, London.

THE merit of Anthon's school editions of the Classics is well known both in this country and America, for the clearness and fulness of their explanations, whether relating to the constructing of the text or an explanation of its allusions. The present edition of *The Æneid of Virgil* is not only a neat and handy reprint of Professor Anthon's last school-book, the notes being placed at the foot of the page instead of relegated to the end: Dr. Major has improved the original in the only way perhaps it requires improvement, by omitting the translation of easy passages, and notes conveying information which in this country is at hand in Classical Dictionaries and other books used by the student.—*Spectator*.

FATHER MATHEW'S EMBARRASSEMENTS.—The subscriptions to compensate this gentleman for his heavy expenses while prosecuting the cause of teetotalism have already exceeded 7000*l.*—a sum nearly sufficient to cover the reverend gentleman's liabilities, but of course not enough to support the expense of another campaign.

From the Spectator.

DO THE TIMES MAKE THE MAN?

A WITTY writer of our day maintains, that whenever the times need such and such a character, it is sure to arise. He believes that the right man ever comes to the surface of events; and that the leading spirits in a community may be regarded as exponents of the pervading sentiments at the period. He holds that the anchorite and fakir denote the prevalence of ascetic religious feeling; the sturdy Luther, that of uneasy craving after religious freedom of thought. The searching reasonings of a Hobbes, he believes, were prompted by a strong appetite in the seventeenth century for philosophical theory; whilst the mild and attractive but inconclusive writings of a Dogald Stewart and a Mackintosh naturally find favor with the less robust-minded community of the nineteenth. These, out of many more examples, are cited in illustration of his proposition: which, nevertheless, we cannot allow to supply a complete explanation of the success of particular individuals at given periods. There are accidental circumstances, in most cases, which connect themselves with the qualities of the man, forming the vantage-ground from which he passes on to power or to fame. It is impossible, for instance, to treat of the political events that are passing before our eyes without admitting that Sir Robert Peel does represent the actual condition of the reflecting mind of England; and that he deals with the government of the country accordingly, after a fashion that no other statesman would venture to practise. But there is no ground for believing that his personal talent and pertinacious will are the whole cause of his present ascendancy. The wealth to which our premier succeeded by inheritance counts for much in gaining the estimation and confidence of the public of England, and stands quite apart from his personal character. Then, he is not a young man: his age inspires a belief in his sagacity, which would have been withheld from him twenty years ago; further, he has adopted a policy distasteful to the bulk of his party; which is a guarantee for his sincerity in following it up, since their displeasure must cause him very considerable pain. The reigning monarch, again, happens to concur in his

present views of what is fitting to be done for the Irish; a lucky accident, which, had it existed in 1800, would have crowned the endeavors of William Pitt to consolidate the Union on a secure basis. And, which perhaps is not among the least important circumstances of Sir Robert Peel's position, the nation entertains a sober conviction, that his rivals, the whigs, are at once incapable and insincere politicians; and, as such, it desires no fresh experiment of their management of public affairs, coupled with perhaps a quarrel with our French neighbors, resulting from the personal arrogance of a leading member of their party.

With such fortunate accessory advantages on his side, it is difficult to determine whether Sir Robert Peel is so much the product of his times, as he is, simply, the only instrument suited to them which is at our disposal. Nor, after all, is it very creditable to the generative force of "the times," that one man should be found playing two such different parts in his life as Sir Robert Peel has assuredly done. That no one man has sprung upon the stage, possessing patriotic impulses and commanding qualities, with the fresh stamp and impress of his times upon him, would seem to negative, in some sort, the foregoing hypothesis; inasmuch as, for want of such a one to direct a new form of things, we are obliged to adapt to the purpose one fashioned in an opposite school.

Perhaps the real solution of this is to be found in the peculiar temper of our present transition state. From the predominance of the desire for peace and quiet, and the facilities they afford for carrying out all sorts of material improvements in the community, the minister whose prudence can secure us from agitating discord is the man for the middle classes, to whom "order" is as the breath of life. "The collective impersonation of false pretences," (as some one called the French Chamber,) which fills the halls of St. Stephen's, no longer excites the community to any interest in its agency as an engine of government. This political collapse, whilst it is unfavorable to the production of a statesman-hero, is favorable to a government of expediency *par excellence*; for which, as has often been shown, Sir Robert Peel's is extremely well suited. The day may come when a reconstructive genius shall be necessary, to mould anew the elements of controlling power.

which recent dislocations and the action of new forces have partially deranged; when God grant that "the right man" may arise! But the tendency of legislation at this present time is not so much towards a principled reformation as a bit-by-bit amendment; and for this, no wonderful genius but ordinary guides with honest intentions will be found to suffice. For instance; reformation in what regards the most widely-spread of our national grievances—the frightful expensiveness of all kinds of justice (amounting to a practical denial of justice so far as a large proportion of us are concerned)—will hardly be undertaken on any comprehensive scale; but peddling laws will from time to time be framed, to tinker particular defects now existing, and appease a certain class of sufferers. And so we shall go on, probably for a number of years, until the great difficulty occur on the subject of the unemployed, that is, surplus labor of England; the most formidable problem in store for the governing minds of this vast and enlightened empire.

Meanwhile, the measures pending in parliament for pacifying the Irish Catholics are, unquestionably, distasteful to the sincere Church-of-Englander and sectarian Protestant; but what remedial measure is ever otherwise? It is the inevitable fate of posterity to suffer for the misdeeds of their progenitors: we are "posterity" in relation to the government of the eighteenth century, and we must either retrieve their errors or commit similar ones. Fortunately, no set of aspirants to office are found, just now, willing to turn the popular prejudices to account, or we should reckon with less confidence than we do on the carrying of our minister's conciliatory policy into effect. Nay, we might even be destined to behold renewed coercion bills, backed by glittering bayonets, once more at work in the Emerald Isle. But these, we trust, will never again be employed, unless, after England and the English shall have ceased to be in the wrong, the Irish forfeit their claim to our sympathy by refusing to be content with a fair measure of reparation.

DR. LARDNER'S POPULAR LECTURES, No. 2. The Minor Planets; Weather Almanacs; Hal-

ley's Comet; The Atmosphere; The New Planets. We were especially interested in the Lecture on Halley's Comet. In one of the notes to this lecture is a French story which we copy:

"Messier passed his life in search of comets. He was an excellent man, but had the simplicity of a child. At a time when he was in expectation of discovering a comet, his wife took ill and died. While attending upon her, being withdrawn from his observatory, Montagne de Limoges anticipated him by discovering the comet. Messier was in despair. A friend visiting him, began to offer some consolation for the recent affliction he had suffered. Messier, thinking only of his comet, exclaimed, 'I had discovered twelve. Alas, that I should be robbed of the thirteenth by Montagne!' and his eyes filled with tears. Then remembering that it was necessary to mourn for his wife, whose remains were still in the house, he exclaimed, 'Ah! cette pauvre femme,' and again wept for his comet."

Redding & Co. have sent us a copy of the REV. SYDNEY SMITH'S FRAGMENT ON THE IRISH ROMAN CATHOLIC CHURCH, printed very handsomely.

Haliburton & Dudley have issued a HISTORY OF THE RISE AND PROGRESS OF THE ORDER OF ODD FELLOWS. It seems to be very minute, and to be principally intended for the members of the said order.

SOUTHERN LITERARY MESSENGER, for May.

THE CLUB ROOM, AND OTHER TEMPERANCE TALES, by T. S. Arthur. Published by S. Ferrett & Co., Philadelphia. We are not afraid to recommend, unread, anything from the warm heart and sound judgment of Mr. Arthur.

From Wiley & Putnam, New York.

We have just received a beautiful collection of ten volumes of their LIBRARY OF CHOICE READING. This series is handsomely printed, upon fine paper and neatly done up. It is of the most convenient size for the gentle reader, and combines good taste with cheapness. We do not doubt that it will have a very extensive sale, combining, as it does, attractions for readers of all ages. We copy the titles of the volumes, with a considerable proportion of which our readers have already made a favorable acquaintance by means of reviews which we have copied from the Foreign Journals.

1. EÖTHEN.

2. THE AMBER WITCH.

3. UNDINE.

4. IMAGINATION AND FANCY, by Leigh Hunt.

5. DIARY OF LADY WILLOUGHBY.

6 and 9. HAZLITT'S TABLE TALK.

7. HEADLONG HALL AND NIGHTMARE ABBEY.

8. FRENCH IN ALGIERS, by Lady Gordon.

10. ANCIENT MORAL TALES.

We are desirous of doing whatever we can, to make known the publication of such a course, not doubting but that it will continue to deserve the praise challenged by its motto from Charles Lamb—"BOOKS WHICH ARE BOOKS."

From Jerrold's Magazine.

THE HISTORY OF ST. GILES AND ST. JAMES.

CHAPTER IX.

"GUILTY—DEATH!"

What familiar syllables were these in the good old times—the time of our history! In those happier days, how many goods and chattels, live stock and dead, were protected, watched by Death! Death was made by law the guardian of all things. Prime agent, great conservator of social security—grim keeper of the world's movables. Death, a shepherd, avenged the wrongs of stolen mutton; Death stood behind every counter, protector of chapman's stock; Death was the day and night guard of the highway traveller against the highway thief; Death watched ox and ass; the goose on the common, the hen on the roost. Even at the altar, Death took his cautious stand, that Hymen might not be scoffed, defrauded by wicked bigamist. *De minimis curat Mors*. Turn where he would, the rogues' path was dug with graves. Nevertheless, the world grew no better; made no visible return to that happy state, ere hemp was made a sovereign remedy for wrong. And so by degrees Death lost somewhat of his reputation with the members of the world; and by degrees many things were taken out of his charge. It was found that—sheep were stolen—tradesmen's goods lifted—pockets picked—hen-roosts forced—and maids wickedly married by men already bound—it was seen that these abominations continued and increased, aye, in the very face of the great ghastly bugbear Death, and so his watch and ward were made a lighter task; he was gradually relieved of many of his social duties; the world, to the astonishment of some folks, still spinning on its axis, though the life of immortal man was not, as in the good old times, offered to stolen colt, to the king's gracious face unlawfully stamped in counterfeit metal, to a hundred other sins all made mortal by the wisdom of untaught humanity. Truly, justice, turning back the leaves of the jail calendar, might sit awhile in sackcloth and ashes, penitent for past transgressions—past wrongs committed in her moral blindness! The sword of justice! An awful weapon truly: a weapon, working out the will of highest Providence: a solemn interest which man solemnly acknowledges. This has been, and may be. Yet, thinking of the world's mistakes; of the cruel blunders worked by law on man, the sword of justice—of so-called Christian justice robed and ermined—may sometimes seem to the eye of grieved humanity as terrible as the blood-dripping tomahawk of the wild, revengeful savage. The sword of justice! May not the time come—it will come, as surely as the sun of far-off years—when justice shall lay down her sword!—when, with better wisdom, she shall vindicate her awful mission to mankind, yet shed no drop of blood!

Let us return to St. Giles; to the boy in his fifteenth year, spawned upon the world and reared by daily wrong and ignorance, a morsel for the hangman. Now, a condemned thief, palsied and aghast with terror, upon the very threshold of the world; to be flung therefrom, an offering to the majesty of offended law. Grim majesty—ghastly Moloch! Stately wickedness, with robes dyed in the blood of sinning ignorance! A majesty, that the principle of all evil may too often smile upon as its working genius here on earth. A majesty as cold and pulseless as the idol whose wooden nostrils know not the sacrifices its darkened wor-

shippers prepare it. But St. Giles will now know there is a government—a knot of the wise and good, whose harmonious souls combined make up the music of the state; the moral melody that softens and refines the rugged, dull-eared mass. He will now know this; the hangman will teach it him. A sharp, short lesson; the first and last prepared him by a paternal state.

"Guilty—death!" Such was the verdict. Tom Blast breathed heavily, and a faint smile flickered at his lips as he felt assured of his escape. Still he durst not turn his eye towards his boy-victim in the dock. Conscience was at the felon's heart; and seared, withered as it was, it felt the sudden horror of remorse. His features grew pale, then dark; were for a moment convulsed; then instantly—daring no look at St. Giles—he disappeared from the dock. The boy stared about him with a foolish gaze, and then began to sob. There was no terror—no anguish in his face. It was the grief of a boy doomed to a whipping, not the gibbet; and it was such sorrow—such seeming childish ignorance of the impending horror—that to those who looked upon him made his condition more terrible. And then again it seemed impossible that the sentence, so sonorously uttered, should be carried out. Could it be that such an array of judges—such wisdom, such learning, such grave and reverend experience—should be opposed to a miserable child, of no more self-accountability than a dog? Appalling odds! Could it be thought that the scene was a frightful reality of daily, breathing life? Was it not a grim farce—a hideous, foolish mockery? Could the wise hearts of men—fathers of well-taught, well-tended, happy children—doom that child to death? That miserable item of human ignorance—that awful reproach to those who made laws to protect property, but left the outcast poor a heedless prey to their own unbridled instincts? Nevertheless, the law would hang St. Giles; and grave, respectable, church-going men, in the very cosiness of their ignorance, would clasp their hands, and raise their eyes, and pity and wonder at the wickedness of the new generation!

A turnkey in the dock took St. Giles by the hand, and in a moment the boy had disappeared. "Good God!" cried a voice, convulsed with grief. "Silence in the court!" exclaimed the crier; and immediately another wretch took his place at the bar, and the terrible course of law continued. It was Capstick, whose exclamation had called down the official rebuke; it was really Capstick, although even the wife of his bosom might have paused, ere she acknowledged him; so suddenly and frightfully had the brief business of the trial wrought a change in him. His flesh seemed jaundiced, and his black eyes, violently dilated, rolled restlessly about. His face appeared of a sudden sharpened like the face of a sick man; and his arm shook, palsied, as with his nails he grasped the arm of Bright Jem. "Let us go," said Jem, chokingly—"we can do no good here;" and Capstick, staring stupidly about him, suffered himself to be led from the court. In a few moments they stood in the Old Bailey. It was a lovely spring night. The breath of May, even in the Old Bailey, came sweet and odorless—carrying freshness to the heart and brain. The moon shone with brightest, purest lustre; all the stars of heaven seemed visible; all looking down in their bright tenderness, as though they looked upon a kindred sphere of purity and light, and loved it. Capstick gazed at the magnificence, and the tears thick and fast fell from him.

Then in a subdued, a comforting voice, he said—"No, Jem, no; it's a wickedness to think it; there's a God in heaven, and they can't do it."

"Hadn't we better see Tangle, the lawyer?" asked Jem. "He has n't done much, to be sure; still he may yet do something. I did n't see him nowhere in the court—saw nobody but his clerk."

"Yes, we'll see him—we'll see him," said Capstick. "He's a scoundrel; but then he's fitter for the world. For the truth is, Jem, we're all scoundrels." Jem made no answer to this charitable creed. "All scoundrels; and I'm about the poorest, meanest, shabbiest villain of the lot. And yet you'll see how I shall carry it off. They'll hang this wretched boy—oh, never doubt it, Jem! they're bad enough for anything—they'll hang him. And I shall still go on sleek and smooth in the world; making muffins and laying by the pennies; paying rent and taxes; owing no man a shilling, and so easy and pleasantly earning a good name, and being mightily trumped up for doing it. I shall go on being called a respectable man; and I shall grin and smile at the lie, and show a satin cheek to the world, as if the lie was true as gospel truth. And then I shall die and be buried with feathers; and Mrs. Capstick will put a stone over me—I know her pride, Jem; I know she'll do it—a stone with a bouncing flam upon it; all lies—lies to the last. Oh, Jem," cried Capstick, groaningly, "if the devil ever takes churchyard walks, how he must chuckle and rub his brimstone hands, when he reads some of the tombstones! Eh? How he must hold his sides at the 'loving husbands,' 'affectionate fathers,' 'faithful friends,' and 'pious Christians,' that he sees advertised there! For *he* knows better, Jem; eh? *He* knows better," cried the muffin-maker with increasing bitterness.

"Well," said Jem, "I can't say; who can? But I should hope the devil knew nothing at all about the matter. But howsoever, be that as it may, he has nothing to do with the business that's brought us out to-night."

"I wish he had n't, Jem, I wish he had n't," cried Capstick with stifled emotion. "But here, walking as we are, down this blessed Fleet-street—oh lord! does n't it seem strange after what we've just left to see the sight about us!—walking here, do you think the devil is n't pointing his finger at me, and saying with a grin to one of his imps, 'There goes the respectable muffin-maker that's sold a boy's blood for ten pounds.'"

"How can you talk in that way?" said Jem, "the devil's the father of lies, and only keeps up his character if he says it."

"Not a bit; it's the devil that speaks truth of our lies; that turns us inside out, and shames sanctified faces with the black hearts that have been under 'em. I say I have sold the boy—put the rope about his neck. And for what? for ten pounds. What a fine fellow I thought myself when I stirred in the matter! What a lump of virtue—what a wonderful bit of public spirit I thought I was, when, day after day, I neglected my muffins and the partner of my hearthstone, to go thief-catching. And I believed I was doing a fine thing—and so, you know I did, I crowed and cackled about the ends of justice. All a sham—all a brave flashy cloak to hide a rascal dirtiness. It was the thoughts of the ten guineas, Jem, the ten guineas, that called all the poison out of my heart and has made me hang a wretched, untaught beggar-boy. Yes, I'm a pretty respectable scoundrel—a fine public-spirited miscreant, I am."

Bright Jem, used to the muffin-maker's humor, made no further answer to this self-reproach; but again urged the necessity of consulting Tangle. "It can't be done to-night—but we'll at him the first thing to-morrow," said Capstick.

"To-morrow's Sunday," said Jem.

"What of that?" asked Capstick. "People come into the world on Sundays, so it can't be unlawful to help to save 'em from going—look there, Jem," and Capstick pointed to a carriage rolling rapidly past.

"That's the Marquess'—come from the trial. There's young St. James in it; well, he's going to better comfort than a stone cell. Howsoe'er, he's a fine fellow—a kind good heart is in that little chap, I'm sure of it. How nicely he gives his evidence, did n't he? And how kindly he seemed to look at St. Giles in the dock; as much as to say, 'Poor fellow, I wish I could get you out o' that!' He'll make a true man, that boy will," said Jem; and then he mournfully added, "and so would poor St. Giles. Ha! if when Susan brought him home out o' the snow, if he and young St. James had been made to change berths, eh! There'd have been a different account of both of 'em I should think. And yet you see how the poor's treated; just as if they came into the world with wickedness upon 'em; a kind of human natur vermin—things born to do all sorts of mischief, and then to be hung up for doing it."

"We'll go to Tangle to-morrow—early to-morrow," said Capstick; who, buried in his compunctious grief, had given no ear to the reflections of Jem. "Good night; early to-morrow." And the muffin-maker suddenly broke from his companion, and strided home—a miserable home to him, whose acute sensibility reproached him as unworthy of the household comforts about him. He looked upon the part he had taken with intense remorse. The would-be misanthrope loathed himself for what he deemed his selfishness of heart—his cruelty towards wretchedness and ignorance. Within a few steps of his door, he paused to call up—with all the power he had—a look of serenity, of decent composure. Somehow, he felt uneasy at the thoughts of meeting his wife. At length he prepared himself, and with a tolerably successful face of tranquillity, crossed his threshold. He exchanged but one look with his wife; it was enough: it was plain she knew the fate of St. Giles. How should it be otherwise? A score of neighbors, customers, and had thronged the shop with the mortal intelligence; and some ventured to hope that Mr. Capstick would n't sleep the worse for his day's work—others begged to ask if the muffin-maker thought the hanging of a poor child would bring a blessing on him—and some hinted an opinion that those who were so sharp after evildoers had commonly not the cleanest consciences themselves. These interrogatives and innuendoes had to be severally answered and warded by the muffin-maker's wife, who, to give her due credit, was not slow at any kind of reply, and was truly a very respectable mistress "of fence." Nevertheless, the exercise would heat a temper never prone to coldness, and in the present instance raised to boiling heat, by what she deemed the malice of her neighbors. And yet, it would have made Capstick's conjugal heart glad again, had he heard how eloquently, how magnificently his acts were defended by his wife: for Mrs. Capstick most volubly and vehemently begged to assure her neighbors, "that there was not a man in the

parish fit to wipe her husband's shoes"—"that he was only wrong in being too honest"—"that a better soul or kinder-hearted creature never walked"—and that, in short, in the depths of her charity, she "only wished that those who spoke a word against him had half such a husband: the neighborhood would be all the quieter for it, that's what she knew, if they had." All this did honor to Mr. Capstick, and doubtless would have solaced the wounded bosom of her lord, could he only have known it; but Mrs. Capstick had too much humility to vaunt her own virtues, therefore she breathed no word of the matter to her well-defended husband. Not that, the shop being closed, and the wedded couple seated at the fireside, Mrs. Capstick was silent; certainly not; for, whilst the muffin-maker tried to solace himself with a pipe, his wife thus declared herself:—

"Well, Mr. Capstick, now I hope you're satisfied! I hope you've made a nice day's work of it! A pretty name you've got in the parish! There'll be no living here—I'll not live here, I can tell you. All the world will point at you, and say, 'There goes the man that hanged that wretched little child!'"

Capstick suddenly took the pipe from his mouth, and stared at his wife. It was strange: he had himself said something of the kind to Bright Jem. He then renewed his smoking, speaking no syllable in answer to his spouse; and yet eloquently replying to her philippics by pooh-pooh-poohing the smoke from him, now in short, hasty, irascible puffs, and now in a heavy volume of vapor. There was a majesty in his manner that seemed quietly to defy the assaults of his better moiety. There seemed, too, to be no getting at him for the clouds in which he industriously involved himself.

"And I should like to know what your satisfaction will be for what you've done. Why, you'll never have another happy moment; you can't have! That poor child will always be before your eyes. And then what a beautiful business you'll lose: for nobody will deal with you. Ha! nice airs the Gibbises will give themselves, now." (The Gibbises, be it known, were new-come muffin-makers, struggling in hopeless rivalry with the muffins of Capstick.) "Everybody will go to them: I'm sure I don't think 't will be any use our opening the shop on Monday. And all about ten guineas! Ha, they'll be a dear ten guineas to you—better have lost 'em ten times over. And so young a child—only fourteen! To hang him! Don't you think, Mr. Capstick, his ghost will follow you?"

Capstick made no answer; but his eye, turned ominously upon his wife, began to glow like a coal, and he puffed at the smoke like a man laboring with himself. Beautiful philosophy! Full soon the muffin-maker's eye shone with its old tranquil light, and again he smoked calmly—desperately calmly. Still Mrs. Capstick continued the punishment of her tongue; but Capstick had conquered himself, and still replied not. At length in the very heat and fullest pitch of her complaint, Capstick rose, and softly laying down his pipe said—"Mary Anne, I'm going to bed." Poor Capstick! He came home with his heart bleeding; and a little tenderness, a little conjugal sympathy, would have been a value to him; but—as people say of greater matters—it was not to be.

Capstick rose early; and, speedily joined by Bright Jem, both took their way to Mr. Tangle's private mansion, Red Lion Square. It was scarcely

nine o'clock, when the muffin-maker knocked at the lawyer's door! It was quite impossible that Mr. Tangle should be seen. "But the business," cried Capstick to the man-servant—a hybrid between a groom and a footman—"the business is upon life and death."

"Bless you," said the man, "that makes no difference whatever. We deal so much in life and death, that we think nothing of it. It's like plums to a grocer, you know. Mr. Tangle never can be seen of a Sunday before half-past ten; a quarter to eleven he goes, of course, to church. The Sabbath, he always says, should be a day of rest." And Tangle—it was his only self-indulgence—illustrated this principle by lying late in bed every Sunday morning to read his papers. Nevertheless, with smoothly shaven face, and with an all unworldly look, he was, ere the church-bell ceased, enshrined in the family pew. There was he with his wife, decorously garnished with half-a-dozen children, sons and daughters, patterns of Sabbath piety; of seventh-day Christianity. "After six days' hard work, what a comfort it was," he would say, "to enjoy church of a Sunday!" And Tangle, after his fashion, did enjoy it: he enjoyed the respectability which church-going threw about him; he enjoyed his worldly ease and superiority, as manifested in his own cosily furnished pew. Looking upon the pauper worshippers on the benches, and then contemplating the comforts of his own nook, he felt very proud of his Christianity. And in this way did Mr. Tangle attend church. It was a decent form due to society, and especially to himself. He went to church as he went to his office—as a matter of business; though he would have been mightily shocked had such a motive been attributed to him.

"I'll come at half-past ten," said Capstick, "for I must see him." The servant looked stolidly at the muffin-maker, and, without a word, closed the door. "He can then tell us," said Capstick to Jem, "when he can see us in the afternoon. And now, Jem, we can only stroll about till the time comes." And so they walked on silently; for both felt oppressed with the belief that their errand to the lawyer would be fruitless; yet both were determined to try every means, however hopeless. They walked, and sauntered, and the church-bells rang out, summoning Christian congregations to common worship. "There's something beautiful in the church-bells, don't you think so, Jem?" asked Capstick, in a subdued tone. "Beautiful and hopeful!—they talk to high and low, rich and poor in the same voice; there's a sound in 'em that should scare pride, and envy, and meanness of all sorts from the heart of man; that should make him look upon the world with kind, forgiving eyes; that should make the earth itself seem to him, at least for a time, a holy place. Yes, Jem; there's a whole sermon in the very sound of the church bells, if we have only the ears to rightly understand it. There's a preacher in every belfry, Jem, that cries 'Poor, weary, struggling, fighting creatures—poor human things! take rest, be quiet. Forget your vanities, your follies; your week-day craft, your heart-burnings! And you, ye human vessels, gilt and painted; believe the iron tongue that tells ye, that for all your gilding, all your colors, ye are of the same Adam's earth with the beggar at your gates. Come away, come, cries the church-bell, and learn to be humble; learning that, however daubed and stained, and stuck about with jewels, you are but grave clay!"

Come, Dives, come; and be taught that all your glory, as you wear it, is not half so beautiful in the eye of heaven, as the sores of uncomplaining Lazarus! And ye poor creatures, livid and faint—stinted and crushed by the pride and hardness of the world—come, come, cries the bell, with the voice of an angel—come and learn what is laid up for ye. And learning, take heart and walk among the wickednesses, the cruelties of the world, calmly as Daniel walked among the lions.’” Here Capstick, flushed and excited, wrought beyond himself, suddenly paused. Jem stared, astonished, but said no word. And then, Capstick, with calmer manner, said—“Jem, is there a finer sight than a stream of human creatures passing from a Christian church?”

“Why,” said Jem, “that’s as a man may consider with himself. It may be, as you say, a very fine sight—and it may be, what I call a very sad and melancholy show, indeed.”

“Sad and melancholy!” cried Capstick; “you’ll have a hard task to prove that.”

“Perhaps so—only let me do it after my own fashion.” Capstick nodded assent. “Bless you! I’ve thought of it many a time when I’ve seen a church emptying itself into the street. Look here, now. I’ll suppose there’s a crowd of people—a whole mob of ’em going down the church steps. And at the church door, there is I don’t know how many roods of Christian carriages—with griffins painted on the pannels, and swords, and daggers, and battle-axes, that, as well as I can remember, Jesus does n’t recommend nowhere: and there’s the coachman, half-asleep and trying to look religious—and there’s footmen following some and carrying the Holy Bible after their misuses, just as to-morrow they’ll carry a spaniel—and that’s what they call *their* humility. Well, that’s a pleasant sight, is n’t it? And then for them who’re not ashamed to carry their own big prayer-books, with the gold leaves twinkling in the sun, as if they took pains to tell the world they’d been to church—well, how many of them have been there in earnest? How many of them go there with no thought whatsoever, only that it’s Sunday—church-going day! And so they put on what they think religion that day, just as I put on a clean shirt. Bless you! sometimes I’ve stood and watched the crowd, and I’ve said to myself—‘Well, I should like to know how many of you will remember you’re Christians till next week? How many of you will go to-morrow morning to your offices, and counting-houses, and stand behind your counters, and, all in the way of business—all to scramble up the coin—forget you’re miserable sinners, while every other thing you do may make you more miserable, only you never feel it, so long as it makes you more rich!’ And so there’s a Sunday conscience like a Sunday coat; and folks, who’d get on in the world, put the coat and the conscience carefully by, and only wear ’em once a week. Well, to think how many such folks go to worship—I must say it, Master Capstick, to stand inside a church and watch a congregation coming out, I can’t help thinking it, however you may stare, may be, thinking after my fashion, a melancholy sight indeed. Lord love you, when we see what some people do all the week—people who’re staunch at church, remember—I can’t help thinking, there’s a good many poor souls who’re only Christians at morning and afternoon service.”

Capstick looked earnestly at Jem and said, “My

dear fellow, it’s all very well between you and me to say this; but don’t say it to the world; don’t Jem, if you would n’t be hunted, harried, stoned to death, like a mad dog. Folks won’t be turned inside out after this fashion, without revenging the treatment with all sorts of bad names. Very pure folks won’t be held up to the light and shown to be very dirty bottles, without paying back hard abuse for the impertinence. Jem, whatever coat a man may wear, never see a hole in it. Though it may be full of holes as a net, never see ’em; but take your hat off to the coat, as if it was the best bit of broad-cloth in the world, without a flaw or a thread drop, and with the finest bits of gold lace upon it. In this world, Jem, woe to the man with an eye for holes! He’s a beast, a wretch, an evil-speaker, an uncharitable thinker, a pest to be put down. And Jem, when the respectable hypocrites make common cause with one another the Lord help the poor devil they give chase to!”

“I always speak my mind,” said Jem.

“It’s an extravagance that has ruined many a man,” said the muffin-maker. “But enough of this, Jem; it’s just the time to catch Tangle before he goes out.” A few moments brought them to the lawyer’s door. Ere, however, the muffin-maker could touch the knocker, the door opened, and Mr. Tangle, his wife, his two sons and two daughters presented themselves, all, the females especially, being dressed for church. Yes; dressed for church; carefully, elaborately arrayed and ornamented, to sustain the severest criticism that, during the hours of devotion, might be passed upon them by sister sinners.

“Mr. Tangle,” said Capstick, “I won’t keep you a minute: but when can I call on—”

“Nothing secular to-day, sir,” said Tangle, and he waved both his hands.

“But, Mr. Tangle, there’s life and death, sir”—cried Capstick, but Tangle interrupted him:

“What’s life and death, sir? What are they, sir, that we should do anything secular to-day!”

“But, Mr. Tangle, it’s the fate of that poor wretched boy; and there is n’t a minute to lose,” urged the muffin-maker.

“I shall be very glad to see you in the way of business, to-morrow,” replied Tangle, laboring to appear very placid; “but I beg of you, my good man, not to disturb the current of my thoughts—of my Sabbath feelings—with anything secular to-day. To me the world is dead on Sundays.”

“But won’t you do good on Sundays!” cried Capstick.—“Your religion does n’t forbid that, I suppose?”

“My good man, let me have none of your free-thinking ribaldry here. This is my door-step, and don’t defile my threshold with your profanity. I have given you my answer. Nothing secular to-day.” Saying this with increased vehemence, Mr. Tangle was bustling from the door with his family—who, looking wondering looks at Capstick and Jem, had walked stately on—when a carriage rapidly turned the square, and in a moment stooped at Tangle’s door. Instantly, Mr. Tangle brought himself up; and cast, certainly, a look of secular curiosity towards the carriage windows. In an instant, young Lord St. James alighted, and was followed by his tutor—worn and broken since we last met him—Mr. Fulder. Mr. Tangle immediately recognized the young nobleman, and although it was Sunday, advanced towards him with pains-taking respect. “Your wife told us you were here, Mr. Capstick,” said his lordship to the muffin-maker.

"Pray, sir, can we consult you upon a business that is somewhat urgent?" said Folder to the attorney.

"Certainly, sir; anything for his lordship. Excuse me one moment;" and Tangle, with un-wonted agility, skipped after his wife and family. They must go to church without him. A lord, a young lord, had called upon him—that sweet young gentleman in the sky-blue coat and lace-collar—and the business was imminent. He, the husband and father, would join them as soon as he could. With many backward, admiring looks at the lovely little nobleman, did Mr. Tangle's family proceed on their way to church, whilst Tangle—the groaning victim to secular affairs—ushered young St. James and Mr. Folder into his mansion. "We can do nothing without you," said St. James to Capstick and Bright Jem; who thereupon gladly followed, the attorney marvelling at the familiarity of the boy nobleman.

"What can I have the honor to do for his lordship?" asked Mr. Tangle, with a smile dirt cheap at six and eight-pence.

"We should not have troubled you to-day," said St. James, "only you see—"

"Don't name it, my dear young lord!" exclaimed Tangle.

"Only," chimed in Mr. Folder, "they talk about hanging on Wednesday."

"Very true," said Tangle; "I believe the affair comes off on Wednesday. A great pity, sir! Quite a child, sir; and with good parts—very good parts. Nevertheless, sir, the crime of horse-stealing increases hourly; and without some example is made, some strong example is made—"

"Why, they hanged four for horse-stealing last session," said Capstick.

Tangle looked round with astonishment at the interruption, and then observed—"That only proves they don't hang enough."

"My opinion, Mr. Tangle; quite my opinion. We want stronger laws, sir; much stronger. If we were to hang for everything, there'd be an end of crime altogether. It's because we only punish by halves—now hanging one, and now another—that we have such a continual growth of vice. We ought to pull crime up by the roots; now our present merciful system makes it flourish the stronger. However, his young lordship does n't think so. He has all the generosity of youth, and insists that St. Giles should not be hanged."

"God bless him!" cried Capstick.

"Amen!" said Bright Jem.

"I must request that we have no interruption," said Tangle, looking loftily at the two offenders. "Perhaps, sir," and the lawyer turned to Folder, "perhaps, you will state your case."

"Just a word in private," said Folder; and Tangle immediately led him into a small adjoining room, and closed the door. "You see, Mr. Tangle," said Folder, "I consider this to be a very foolish, weak business; but the young gentleman is a spoilt child, and spoilt children will have their way. In one word, his lordship must be humored, and therefore St. Giles—though it would be much better for him to be put at once quietly out of further mischief—must not be hanged. The marquess has his own notions on the matter; proper notions, too, they are, Mr. Tangle; notions that do honor to him as a legislator, and would, I verily believe, let the law take its course. But, poor man! what can he do?"

"Do what he likes, can't he?" asked Tangle.

"By no means. You see, it is with the boy as it was with the boy Themistocles," said Mr. Folder.

"Really?" observed Tangle.

"One of Plutarch's own parallels. The boy rules the marchioness, and the marchioness rules—"

"I understand," said Tangle: "rules the marquess. It will happen so."

"And therefore, the sum and end of it all is, the horse-stealer must be saved. Bless you! his young lordship has threatened to fall sick and die, if St. Giles is hanged; and has so frightened his poor mother, who again has made the marquess so anxious, that—the fact is, we've come to you."

"It's a great pity that I did n't know all this before. The case, my dear sir, was a nothing—a very trumpety case, indeed; but then, to a man with my extensive practice, it was really not worth attending to. Otherwise, and to have obliged the noble family, I could have made sure of an *alibi*. It's a great pity that so noble a family should be so troubled, and by such riff-raff!" said Tangle.

"It is, sir; it is," said Folder—"you can feel for us. Now, there's no doubt that, in so trifling a matter, the marquess has more than sufficient interest to save a thief or two; nevertheless, I have suggested that a petition should be got up by the boy's friends—if the wicked creature has any friends—and that so the marquess—you understand?"

"Perfectly," replied Tangle: what would he not understand in such a case? "There is nothing more easy than a petition. How many signatures would you like to it? Any number—though fifty will be good as five hundred."

"Do you think the jury would sign?" asked Mr. Folder. "Not that it's of any consequence; only for the look of the thing."

"The foreman, I know, would not," said Tangle. "He lost a colt himself three years ago, and is n't yet settled to the injury. Nevertheless, we can get up a very tidy sort of petition; and with the marquess' interest—well! that young St. Giles is a lucky little scoundrel! he'll make his fortune at Botany Bay."

"And now, Mr. Tangle, that we understand one another, we'll join, if you please, his lordship.—Well, my lord," said Folder, returning, "I have talked the matter over with Mr. Tangle, and, though he gives very little hope—"

"There's all the hope in the world," said Capstick, "for his lordship says he'll take the petition himself to the minister, who's his father's friend, and, if I may advise the marchioness, his mother—"

"My good man," observed Mr. Folder, "we in no way need your advice in the matter. Hold your tongue."

"Should n't mind at all obliging you, sir, in any other way," said the unruffled Capstick; "but, as his young lordship here, as he tells me, has been to my shop and all to see me about the matter, I think my tongue's quite at his service."

"To be sure it is, Capstick," said young St. James, "go on. Mr. Folder says they'd better hang St. Giles; and papa says so too; but they shan't do it for all that. Why, I should never have the heart to mount a horse again."

"A noble little chap!" whispered Bright Jem to Capstick.

"And so, as I told you, Capstick, I went to your house, as you know all about the boy, and the boy's friend, to see about a petition; for that's the way, they tell me——"

"Give yourself no further trouble," said Tangle "the petition shall be prepared, my lord. I'll do it myself, this very day, though the affair is secular. Nevertheless, to oblige your lordship——"

"You're a good fellow," said young St. James, patronizing the lawyer; and, after a few preliminaries were settled, the conference concluded.

CHAPTER X.

And young St. Giles lay in Newgate, sinking, withering, under sentence of death. After a time, he never cried, or clamored; he shed no tear, breathed no syllable of despair; but, stunned, stupefied, seemed as if idiocy was growing on him. The ordinary—a good, zealous man—endeavored, by soothing, hopeful words, to lead the prisoner, as the jail phrase has it, to a sense of his condition. Never had St. Giles received such teaching! Condemned to die, he for the first time heard of the abounding love of Christianity—of the goodness and affection due from man to man. The story seemed odd to him; strange, very strange; yet he supposed it was all true. Nevertheless—he could not dismiss the thought, it puzzled him. Why had he never been taught all this before? And why should he be punished, hanged for doing wrong; when the good, rich, fine people, who all of them loved their neighbors like themselves, had never taught him what was right? Was it possible that Christianity was such a beautiful thing—and being so, was it possible that good, earnest, kind-hearted Christians would kill him?

St. Giles had scarcely eight-and-forty hours to live. It was almost Monday noon, when the ordinary—having attended the other prisoners—entered the cell of the boy thief. He had been separated, by the desire of the minister, from his miserable companions, that their evil example of hardihood—their reckless bravado—might not wholly destroy the hope of growing truth within him. A turnkey attended St. Giles, reading to him. And now the boy would raise his sullen eyes upon the man, as he read of promises of grace and happiness eternal: and now his heart would heave as though he was struggling with an inward agony that seemed to suffocate him—and now a scornful, unbelieving smile would play about his mouth—and he would laugh with defying bitterness. And then he would leer in the face of the reader, as though he read to him some fairy tale, some pretty story, to amuse and gull him. Poor wretch! Let the men who guide the world—the large-brained politicians, who tinker the social scheme, making themselves the masters and guardians of their fellow-men—let them look into this Newgate dungeon; let them contemplate this blighted human bud; this child felon, never taught the path of right, and now to be hanged for his most sinful ignorance. What a wretched, sullen outcast! What a darkened, loathsome thing! And now comes the clergyman—the state divine, 'be it remembered—to tell him that he is treasured with an immortal soul; that—with mercy shed upon him—he will in a few hours be a creature of

glory before the throne of God! Oh, politicians! Oh, rulers of the world! Oh, law-making masters and taskers of the common million, may not this cast-off wretch, this human nuisance, be your accuser at the bar of Heaven? Egregious folly! Impossible! What—stars and garters impeached by rags and tatters! St. James denounced by St. Giles! Impudent and ridiculous! Yet here, we say, comes the reverend priest—the Christian preacher, with healing, honied words, whose Book—*your Book*—with angelic utterance, says no less. Let us hear the clergyman and his forlorn pupil.

"Well, my poor boy," said the ordinary, with an affectionate voice and moistening eyes: "well, my child, and how is it with you? Come, you are better; you look better; you have been listening to what your good friend Robert here has been reading to you. And we are all your friends, here. At least, we all want to be. Don't you think so?"

St. Giles slowly lifted his eyes towards the speaker. He then slowly, sullenly answered,—
"No, I don't."

"But you ought to try to think so, my boy; it's wicked not to try," said the ordinary, very tenderly.

"If you're all my friends, why do you keep me here?" said St. Giles. "Friends! I never had no friends."

"You must not say that; indeed, you must not. All our care is to make you quiet and happy in this world, that you may be happier in the world you're going to. You understand me, St. Giles! My poor dear boy, you understand me! The world you're going to!" The speaker, inured as he was to scenes of blasphemy, of brute indifference, and remorseful agony, was deeply touched by the forlorn condition of the boy; who could not, would not, understand a tenderness, the end of which was to surrender him softened to the hangman. "You have thought, my dear—I say, you have thought of the world"—and the minister paused—"the world you are going to?"

"What's the use of thinking about it?" asked St. Giles. "I know nothing of it."

"That, my boy, is because you are obstinate, and I am sorry to say it, wicked,—and so won't try to know about it. Otherwise, if you would give all your heart and soul to prayer——"

"I tell you, sir, I never was learnt to pray," cried St. Giles, moodily; "and what's the use of praying?"

"You would find it open your heart, St. Giles; and though you see nothing now, if you were only to pray long and truly, you would find the darkness go away from your eyes, and you'd see such bright and beautiful things about you, and you'd feel as light and happy as if you had wings at your back—you would, indeed. Then you'd feel that all we are doing for you is for the best; then, my poor boy," said the ordinary with growing fervor, "then you'd feel what Christian love is."

"Robert's been reading to me about that," said St. Giles, "but I can't make it out no-how. He says that Christian love means that we should n't do to nobody what we would n't like nobody to do to ourselves."

"A good boy," said the ordinary, "that is the meaning, though not the words. I'm glad you're so improved."

"And for all that, you tell me that I must

think o' dying—think of another world and all that—think of going to Tyburn, and, and"—here the boy fell hoarse; his face turned ash-color, and reeling, he was about to fall, when the ordinary caught him in his arms, and again placed him on a seat. "It's nothin'—nothin' at all," cried St. Giles, struggling with himself—"I'm all right; I'm game."

"Don't say that, child; I can't hear you say that: I would rather see you in tears and pain than trying to be game, as you call it. That, my boy, is only adding crime to wickedness. Come, we were talking of Christian love," said the ordinary.

"I knows nothin' about it," said St. Giles; "all I know is this,—it is 'nt true; it can't be true."

"Tell me; why not! Come, let me hear all you 'd say," urged the clergyman tenderly.

"Cause if it means that nobody should do to nobody what nobody would like to have done to themselves, why does anybody keep me locked up here! Why did the judge say I was to be—you know, Mister!"

"That was for doing wrong, my boy: that was for your first want of Christian love. You were no Christian when you stole the horse," said the ordinary. "Had the horse been yours, you would have felt wronged and injured had it been stolen from you! You see that, eh, my boy!"

"Did n't think o' that," said St. Giles gloomily.—"But I did n't steal it: 't was all along o' Tom Blast; and now he's got off; and I'm here in the Jug. You don't call that justice, no how, do you! But I don't care; they may do what they like with me; I'll be game."

"No, my dear boy, you must know better: you must, indeed—you must give all your thoughts to prayer, and—"

"It's o' no use, Mister; I tell you I never was learnt to pray, and I don't know how to go about it. More than that, I feel somehow ashamed to it. And besides, for all your talk, Mister, and you talk very kind to me, I must say, I can't feel like a Christian, as you call it,—for I can't see why Christians should want to kill me if Christians are such good people as you talk about."

"But then, my poor boy," said the ordinary, "though young, you must remember, you're an old sinner. You've done much wickedness."

"I never done nothing but what I was taught; and if you say—and Bob there's been reading it to me—that the true Christian forgives everybody—well then, in course, the judge and all the nobs are no Christians, else would n't they forgive me? Would n't they like it so, to teach me better, and not to kill me! But I don't mind; I'll be game; see if I don't be game—precious!"

The ordinary, with a perplexed look, sighed deeply. The sad condition of the boy, the horrid death awaiting him, the natural shrewdness with which he combated the arguments employed for his conversion, affected the worthy clergyman beyond all past experience. "Miserable little wretch!" he thought, "it will be worst of murders, if he dies thus." And then, again, he essayed to soften the child felon, who seemed determined to stand at issue with his spiritual counsellor; to recede no step, but to the gallows foot to defy him. It would be his ambition, his glory—if he must die—to die game. He had heard the praises bestowed upon such a death—had known the contemptuous jeering flung upon

the repentant craven—and he would be the theme of eulogy in Hog Lane—he would not be laughed, sneered at, for "dying dunghill." And this temper so grew and strengthened in St. Giles, that, at length, the ordinary, wearied and hopeless, left his forlorn charge, promising soon to return, and hoping, in his own words, to find the prisoner "a kinder, better, and more Christian boy."

"It's no use your reading that stuff to me," said St. Giles, as the turnkey was about to resume his book; "I don't understand nothin' of it; and it's too late to learn. But I say, can't you tell us somethin' of Turpin and Jack Sheppard, eh? Something prime, to give us pluck!"

"Come, come," answered the man, "it's no use going on in this way. You must be quiet and listen to me; it's all for your good, I tell you; all for your good."

"My good! Well, that's pretty gammon, that is. I should like to know what can be for my good if I'm to be hanged! Ha! ha! See if I don't kick my shoes off, that's all." And St. Giles would not listen; but sat on the stool, swinging his legs backwards and forwards, and singing one of the melodies known in Hog Lane—poor wretch! it had been a cradle melody to him—whilst the turnkey vainly endeavored to soothe and interest him. At length the man discontinued his hopeless task; and, in sheer listlessness, leaning his back against the wall, fell asleep. And now St. Giles was left alone. And now, relieved of importunity, did he forego the bravado that had supported him, and solemnly think of his approaching end? Did he, with none other but the eye of God in that stone cell, upon him—did he shriek and wither beneath the look; and, on bended knees, with opened heart, and flowing, repentant tears, did he pray for Heaven's compassion—God's sweet mercy? No. Yet thoughts deep, anxious thoughts were brooding in his heart. His face grew older with the meditation that shadowed it. All his being seemed compressed, intensified in one idea. Gloomily, yet with whetted eyes, he looked around his cell; and still darker and darker grew his face. Could he break prison! Such was the question—the foolish, idle, yet flattering question that his soul put to itself. All his recollections of the glory of Turpin and Sheppard crowded upon him—and what greater glory would it be for him if he could escape! He, a boy, to do this? He to be sung in ballads—to be talked of, huzzaed, and held up for high example, long after he should be dead—passed forever from the world! The proud thought glowed within him—made his heart heave—and his eyes sparkle. And then he looked about his cell, and the utter hopelessness of the thought fell upon him, withering his heart. Yet again and again—although to be crushed with new despair—he gazed about him, dreaming of liberty without that wall of flint. And thus his waking hours passed; and thus, in the visions of the night, his spirit busied itself in hopeful vanity.

The Tuesday morning came, and again, the clergyman visited the prisoner. The boy looked paler, thinner—no more. There was no softness in his eyes, no appealing glance of hope: but a fixed and stubborn look of inquiry. "He did n't know nothing of what the parson had to say, and he did n't want to be bothered. It was all gammon!" These were the words of the boy felon, then—such was the humanity of the law; poor

law! what a long nonage of discretion has it passed!—then within a day's span of the grave.

As the hour of death approached, the clergyman became more assiduous, fervent, nay passionate in his appeals to the prisoner; who still strengthened himself in opposition to his pastor. "My dear boy—my poor child—miserable, helpless creature!—the grave is open before you—the sky is opening above you! Die without repentance, and you will pass into the grave, and never—never know immortal blessings! Your soul will perish—perish as I have told you—in fire, in fire eternal!"

St. Giles averted his head to and fro, and with a sneer asked, "What's the good o' all this? Have n't you told me so, Mister, agin and agin?"

The ordinary groaned almost in despair, yet still renewed his task. "The heavens, I tell you, are opening for you; repent, my child; repent, poor boy, and you will be an immortal spirit, welcomed by millions of angels."

St. Giles looked with bitter incredulity at his spiritual teacher. "Well, if all that 's true," he said, "it is n't so hard to be hanged, arter all. But I don't think the nobs like me so well, as to send me to sich a place as that."

"Nay, my poor boy," said the ordinary, "you will not, cannot understand me, until you pray. Now, kneel—my dear child, kneel and let us pray together." Saying this, the ordinary fell upon his knees; but St. Giles, folding his arms, so planted himself as to take firmer root of the ground; and so he stood with moody, determined looks, whilst the clergyman—touched more than was his wont—poured forth a passionate prayer that the heart of the young sinner might be softened; that it might be turned from stone into flesh, and become a grateful sacrifice to the throne of God. And whilst this prayer, in deep and solemn tones, rose from the prison-cell, he for whom the prayer was formed, seemed to grow harder, more obdurate, with every syllable. Still he refused to bend his knees at the supplication of the clergyman, but stood eyeing him with a mingled look of incredulity, defiance, and contempt. "God help you—poor lost lamb!" cried the ordinary, as he rose.

"Now, I hope we shall have no more o' that," was the only answer of St. Giles.

The ordinary was about to quit the cell, when

the door was opened, and the governor of the jail, attended by the head-turnkey, entered. "My dear sir, I am glad to find you here"—said the governor to the ordinary. "I have a pleasing duty to perform: a duty that I know it will delight you to witness." The ordinary glanced at a paper held by the governor; his eyes brightened; and clasping his hands, he fervently uttered—"Thank God!"

The governor then turned to St. Giles, who suddenly looked anxious and restless. "Prisoner," he said, "it is my happiness to inform you that his gracious majesty has been mercifully pleased to spare your life. You will not suffer with the unfortunate men to-morrow. You understand me, boy?"—for St. Giles looked suddenly stupefied—"you understand me, that the good king, whom you should ever pray for, has, in the hope that you will turn from the wickedness of your ways, determined to spare your life! You will be sent out of the country; and time given you that, if you properly use, will make you a good and honest man."

St. Giles made no answer, but trembled violently from head to foot. Then his face flushed red as flame, and covering it with his hands, he fell upon his knees; and the tears ran streaming through his fingers. "Pray with me; pray for me!" he cried, in broken voice, to the ordinary.

And the ordinary knelt, and rendered up "humble and hearty thanks" for the mercy of the king!

We will not linger in the prison—St. Giles was destined for Botany Bay. Mr. Capstick was delighted, in his own way, that the ends of justice would be satisfied; and whilst he rejoiced with the triumph of justice, he did not forget the evil-doer; for St. Giles received a packet from the muffin-maker, containing sundry little comforts for his voyage.

"We shall never see him again, Jem," said Mrs. Aniseed, as she left Newgate weeping; having taken her farewell of the young transport. "He's gone forever from us."

"Not he," said Bright Jem; "we shall see him again another feller quite—a true man, yet; I'm sure of it."

Whether Bright Jem was a true prophet will in due season be discovered by the patient reader of the next chapters.

THE VALUE OF A FINE LADY.

A REMINISCENCE. BY JOSEPH HUME.

ONCE I assisted at the *soirée dansante* of the Countess of Fritterfield. The most brilliant star in that galaxy of fashion was the young and lovely Marchioness of Fiddledale. I saw her dancing in the hall. Around her snowy brow were set five hundred pounds: for such would have been the answer of any jeweller to the question, "What are those diamonds?" With the gentle undulations of her bosom, there rose and fell exactly thirty pounds ten shillings. The sum wore the guise of a brooch of gold and enamel. Her fairy form was invested in ten guineas, represented by a slip of lilac satin; and this was overlaid by thirty guineas more in two skirts of white lace. Tastefully disposed down each side of the latter, were six half crowns; which so many bows of

purple ribbon had come to. The lower margins of the thirty guinea skirts were edged with eleven additional guineas, the value of some eight yards of silver fringe a quarter of a yard in depth. Her taper waist, taking zone and clasp together, I calculated to be confined by forty pounds sterling.

Her delicately-rounded arms, the glove of spotless kid being added to the gold bracelet which encircled the little wrist, may be said to have been adorned with twenty-two pounds five and sixpence, and, putting the silk and satin at the lowest figure, I should say that she wore fourteen and sixpence on her feet. Thus, altogether, was this thing of light, this creature of loveliness, rayed from top to toe, exclusively of little sundries, in six hundred and forty-eight pounds eleven shillings.

From Chambers' Journal.

THE FEARLESS DE COURCY.

[The following is a specimen of *Lays and Ballads from Old English History*, (London, James Burns, 1845,) a beautifully embellished little volume of original poetry, professedly "by S. M.," and dedicated to "seven dear children, for whose amusement the verses were originally written." Generally speaking, history in a versified shape is miserable trash; but here we have something very different; and we shall be much surprised if this volume does not long maintain a place amongst the parlor-window favorites of the young. The ballads are not only charmingly written, as far as mere literary art is concerned, but have, besides, a life-like spirit, and a tone of high imaginative feeling, which are peculiarly their own.]

The fame of the fearless De Courcy
Is boundless as the air;
With his own right hand he won the land
Of Ulster, green and fair!
But he lieth low in a dungeon now,
Powerless, in proud despair;
For false King John hath cast him in,
And closely chained him there.

The noble knight was weary
At morn, and eve, and noon;
For chilly bright seemed dawn's soft light,
And icily shone the moon;
No gleaming mail gave back the rays
Of the dim unfriendly sky,
And the proud free stars disdained to gaze
Through his lattice barred and high.

But when the trumpet-note of war
Rang through his narrow room,
Telling of banners streaming far,
Of knight, and steed, and plume;
Of the wild *mêlée*, and the sabre's clash,
How would his spirit bound!
Yet ever after the lightning's flash,
Night closeth darker round.

Down would he sink on the floor again,
Like the pilgrim who sinks on some desert plain,
Even while his thirsting ear can trace
The hum of distant streams;
Or the maimed hound, who hears the chase
Sweep past him in his dreams.

The false king sate on his throne of state,
'Mid knights and nobles free;
"Who is there," he cried, "who will cross the
tide,
And do battle in France for me?
There is cast on mine honor a fearful stain,
The death of the boy who ruled Bretagne;*
And the monarch of France, my bold suzerain,
Hath bidden a champion for me appear,
My fame from this darkening blot to clear.
Speak—is your silence the silence of fear,
My knights and my nobles? Frowning and pale
Your faces grow as I tell my tale!
Is there not one of this knightly ring,
Who dares to battle for his king?"

The warriors they heard, but they spake not a
word;
The earth some gazed upon;

* Prince Arthur of Brittany, whose melancholy fate has been too often the theme of song and story to require notice here.

And some did raise a steadfast gaze
To the face of false King John.
Think ye they feared? They were Englishmen
all,
Though mutely they sate in their monarch's hall;
The heroes of many a well-fought day,
Who loved the sound of a gathering fray,
Even as the lonely shepherd loves
The herds' soft bell in the mountain-groves.
Why were they silent? There was not one
Who could trust the word of false King John;
And their cheeks grew pallid as they thought
On the deed of blood by his base hand wrought;
Pale, with a brave heart's generous fear,
When forced a tale of shame to hear.

'T was a coward whiteness then did chase
The glow of shame from the false king's face;
And he turned aside, in bootless pride,
That witness of his guilt to hide;
Yet every heart around him there,
Witness against him more strongly bare!
Oh, out then spake the beauteous queen: *
"A captive lord I know,
Whose loyal heart hath ever been
Eager to meet the foe;
Were true De Courcy here this day,
Freed from his galling chain,
Never, oh never should scoffers say,
That amid all England's rank and might,
Their king had sought him a loyal knight,
And sought such knight in vain!
Up started the monarch, and cleared his brow,
And bade them summon De Courcy now.
Swiftly his messengers hastened away,
And sought the cell where the hero lay;
They bade him arise at his master's call,
And follow their steps to the stately hall.

He is brought before the council—
There are chains upon his hands;
With his silver hair, that aged knight,
Like a rock o'erhung with foam-wreaths white,
Proudly and calmly stands.
He gazes on the monarch
With stern and star-like eye;
And the company muse and marvel much,
That the light of the old man's eye is such,
After long captivity.
His fetters hang upon him
Like an unheeded thing;
Or like a robe of purple worn
With graceful and indifferent scorn
By some great-hearted king.
And strange it was to witness
How the false king looked aside;
For he dared not meet his captive's eye!
Thus ever the spirit's royalty
Is greater than pomp and pride!

The false king spake to his squires around,
And his lifted voice had an angry sound:
"Strike ye the chains from each knightly limb!
Who was so bold as to fetter him?
Warrior, believe me, no heat of mine
Bade them fetter a form like thine;
Thy sovereign knoweth thy fame too well."
He paused, and a cloud on his dark brow fell;
For the knight still gazed upon him,
And his eye was like a star;
And the words on the lips of the false king died,

* Isabella of Angouleme, wife to King John, celebrated for her beauty and high spirit.

Like the murmuring sounds of an ebbing tide
By the traveller heard afar.

From the warrior's form they loosed the chain;
His face was lighted with calm disdain;
Nor cheek, nor lip, nor eye gave token
E'en that he knew his chains were broken.
He spake—no music, loud or clear,

Was in the voice of the gray-haired knight;
But a low stern sound, like that ye hear

In the march of a mail-clad host by night.
"Brother of Cœur de Lion," said he,
"These chains have not dishonored me!"
There was crushing scorn in each simple word,
Mightier than battle-axe or sword.

Not long did the heart of the false king thrill

To the touch of passing shame,
For it was hard, and mean, and chill;
As breezes sweep o'er a frozen rill,
Leaving it cold and unbroken still,

That feeling went and came;
And now to the knight he made reply,
Pleading his cause right craftily;
Skilled was his tongue in specious use
Of promise fair and of feigned excuse,
Blended with words of strong appeal
To love of fame and to loyal zeal.
At length he ceased; and every eye
Gazed on De Courcy wistfully.
"Speak!" cried the king in that fearful pause;
"Wilt thou not champion thy monarch's cause?"

The old knight struck his foot on the ground,
Like a war-horse hearing the trumpet sound;
And he spake with a voice of thunder,

Solemn and fierce in tone,
Waving his hand to the stately band
Who stood by the monarch's throne,
As a warrior might wave his flashing glaive
When cheering his squadrons on:
"I will fight for the honor of England,
Though not for false King John!"

He turned and strode from the lofty hall,

Nor seemed to hear the sudden cheer
Which burst as he spake from the lips of all.
And when he stood in the air without,
He paused as if in joyful doubt;
To the forests green and the wide blue sky
Stretching his arms embracingly,
With stately tread and uplifted head,
As a good steed tosses back his mane
When they loose his neck from the servile rein;
Ye know not, ye who are always free,
How precious a thing is liberty.
"O world!" he cried; "sky, river, hill,
Ye wear the garments of beauty still;
How have ye kept your youth so fair,*
While age has whitened this hoary hair!"
But when the squire, who watched his lord,
Gave to his hand his ancient sword,
The hilt he pressed to his eager breast,
Like one who a long-lost friend hath met;
And joyously said, as he kissed the blade,
"Methinks there is youth in my spirit yet.
For France! for France! o'er the waters blue;
False king—dear land—adieu, adieu!"

He hath crossed the booming ocean,
On the shore he plants his lance;

* The reader of German will here recognize an exquisite stanza from Uhland, very inadequately rendered.

And he sends his daring challenge

Into the heart of France:
"Lo, here I stand for England,
Queen of the silver main!
To guard her fame and to cleanse her name
From slander's darkening stain!
Advance, advance! ye knights of France,
Give answer to my call:
Lo! here I stand for England,
And I defy ye all!"

From the east and the north came champions
forth—

They came in a knightly crowd;
From the south and the west each generous breast
Throbbed at that summons proud.

But though brave was each lord, and keen each
sword,

No warrior could withstand
The strength of the hero-spirit
Which nerved that old man's hand.

He is conqueror in the battle—
He hath won the wreath of bay;
To the shining crown of his fair renown
He hath added another ray;
He hath drawn his sword for England;
He hath fought for her spotless name;
And the isle resounds to her farthest bounds
With her gray-haired hero's fame.

In the ears of the craven monarch,
Oft must this burthen ring—
"Though the crown be thine and the royal line,
He is in heart thy king!"

So they gave this graceful honor
To the bold De Courcy's race,
That they ever should dare their helms to wear
Before the king's own face:
And the sons of that line of heroes
To this day their right assume;
For, when every head is unbonneted,*
They walk in cap and plume!

From Tait's Magazine.

O RABEQUISTA, THE FIDDLER.

FROM THE PORTUGUESE.

AMONG the living authors of Portugal, who are little, or not at all, known in this country, but whose merits as poets, dramatists, or prose writers entitle them to be so, are the brothers Castilho, A. M. de Souza Lobo, Ignacio Pizarro de M. Sarmiento, J. B. d'Almeida Garrett a very distinguished man of letters, and A. Herculano, author of the "Harp of the Believer" and "The Voice of the Prophet," a young volunteer officer of the Liberal party, at the siege of Oporto, who made himself remarkable by his zeal and bravery, and who, after the death of Don Pedro, instead of hurrying with others to the capital to claim the reward of his services, long remained at Oporto, unsolicitous of court favors, and testified his grief in an elegy on "the romantic emperor who had fought against tyranny," and who had bequeathed his heart to that "faithful city." Of these and other existing ornaments of Portuguese literature, we may take future opportunities of giving some notices. The following little story is but a very trifling specimen of the abilities of *Antonio Feliciano Castilho*, whose name appears under it in a Lisbon periodical of recent date; but, mere trifle

* The present representative of the house of De Courcy is Lord Kinsale.

as it is, there is something peculiar in the turn of the adventure.

On a dark night of last winter, there was a wedding ball in a certain village near the foot of the Mountain Estrella. The wedding-dinner was over at two o'clock in the afternoon; and from that hour till midnight, the clattering dances of wooden shoes had been almost incessant. During all this time, the merriment had been kept alive by liberal supplies of green wine, by love, and by a fiddle, the never-failing guest and companion of every merry-meeting in all the hamlets of this neighborhood. The fiddler, who possessed nothing in the world but a musical ear, (for which we do not know how much per centage he paid out of the hours of industry,) had been one of the numerous candidates for the bride; but having been supplanted by the pecuniary charms of his happy rival, he was here on this occasion—no unhappy man either, but in good humor with his ill fortune. A philosophical fiddler, he had not only had the courage to attend the marriage-ceremony without concealing himself behind one of the church-pillars and rushing forth at the critical moment with a romantic cry of despair, to the dismay of the assembly, but he had helped to twine the arches of pine-boughs for the passage of the triumphant couple. At dinner he had filled repeated bumpers to the health of both, and also of a tawny rustic lass who happened to sit next to him; and all the evening afterwards, and all the night, he animated, by his quaint old minuets, and his inexhaustible store of old-fashioned tunes, the fun of the dancers, male and female, of that economical club, whose vagaries were superbly illuminated by four classical iron lamps, stuck against four newly-whitewashed walls. Some malicious judges of motives—for there are such even in the country—did not fail to set down his gratuitous perseverance to a lurking desire of putting off as long as he possibly could, the fatal moment when the company should disperse, and the doors of his ungrateful fair one exclude him from her presence. Others merely supposed that his zeal was inspired by a newly awakened fancy for another pair of bright eyes, and that he was naturally unwilling to quit a scene where the lady of his thoughts saw him unquestionably playing *the first fiddle*. As to us, without rejecting or admitting either of these opinions, we think it more orthodox to believe, that his pure self-love, as an artist, is a sufficient explanation. Paganini in the theatre at Paris, or on the stage of the opera-house in London, was not a greater personage than our poor fiddler, in a farm-house of the Estrella mountain.

During one of those brief intervals of the ball, when the din of music and feet ceased, only to give play to the much more uproarious clamor of conversation, our hero, whom we shall call Baptist, found his opportunity of insinuating a sly compliment into the ear of her to whom his looks had already been still more eloquent; a smile and a modest look of pleased acknowledgment gave him fresh force for a second attack; he dared to whisper the word *love*; he saw her blush, and once more he saw her smile; he ventured to seize a pretty little hand of this damsel fifteen years old; and from the moment of that endured audacity, he considered his felicity certain. He asks her name, *Anna*; her condition, *single*; her residence, *another farm-house*, distant about half a league in a locality that he is unacquainted with; but which she describes so minutely, that it is evi-

dent his visits there will be acceptable: "In our house," adds Anna, "there live only my mother and myself. My mother keeps house; I tend our flock on the mountain in the day time, and at night work with my mother. Sometimes we sit together at our hearth with nothing new to say to one another, which is dull; now and then we have the company of some young women who live about a quarter of a league from us: I came with two of them to-day; and we are to return together. But for them I should have missed this wedding; and that would have been a pity."

The dancing was renewed; Baptist surpassed himself, if that were possible. The fiddle seemed animated with all the fire, all the brilliant freshness of a newly rising passion. It imparted more life, more ecstasy to the dancers; and Anna, every time that the mazy whirl brought her near to the musician, showed by a look, a movement, an air, that she felt something more than gratitude for the performer. The bow of Cupid, to use the phraseology of the poetico-arcadian schools, never twanged off more sharp and quick arrows than did the bow of a fiddle on this night. The bridegroom, fearing that the transport might not subside before sunrise, availed himself of a momentary pause to call Baptist apart into the garden, and there, after some trifling apologetical preamble, with which Baptist would have willingly dispensed, gave him to understand, in as few words as his embarrassment and the sense of his discourtesy would permit, that it was time to close the entertainment, and for the guests to retire. Baptist, who, like all happy lovers, had kept wholly out of view the fact, that such pleasure must have an end, and in whom (trust the hearts of men!) the thought of his first love, now hopeless, was already partially eclipsed by the radiant image of his new star; Baptist stood undecided for an instant whether he should obey the master of the house, thanking him for his good cheer, or break the fiddle about his ears. A visit to the cellar, to which the host sagaciously invited him, gave him time to recover his temper; and, thanks to a copious draught that prepared him for the journey, the inward strife that had arisen between the two spirits that contend for mastery in the human breast, terminated in the victory of the good angel. During this absence of the life and soul of the party, the greater number of the guests disappeared: and Anna, urged by her companions to withdraw, and persuaded as were the rest, that Baptist would not come back, sadly set out on her way home.

Returning to the room, and finding it deserted by her who alone had filled it, to his eyes, Baptist wished his host good-night. Hardness of heart is not the vice of the truly happy. The bridegroom accompanied him a few steps beyond the threshold, and laughingly told him, in a key sufficiently loud to ensure his being overheard by his wife, that the beautiful Anna, the flower and envy of the night, was the best tender of flocks in the district; that she had a good fortune; excellent hands for the spindle, and a voice for singing that charmed all who heard her; that he therefore advised him to cultivate the good graces of the mother, for that he well knew the girl would think herself fortunate to be able to warble her youth away with such an accompaniment:

Oh, life of my life!
Who can show me your fellow

At fiddle or fife
On the mountain Estrella ?

And with this he bade him farewell ; but not before he had further explained, what Baptist had already known above two hours, that the house was situate at the top of a winding steep, between hills ; that by day two great oak trees, standing close together on the right of the road, would show him that he was near the place, and that at night he would be led to it by the bleating of numerous goats folded in the pen, so that there could be no risk of going astray among those wilds. The night was still dark. Baptist at first, though his mind was all abroad, took the melancholy road that led to his home. But what was he to do there ? Sleep ! who ever slept on the first night of a new love-fever !—To lie awake and sigh ? that is better and more poetically done on the open stage of nature. To transcribe from the tablets of his heart an account of his sensations and wishes in a letter ! Anna probably cannot read ; and he himself, satisfied with his talent as a musical artist, never felt any ambition to accumulate knowledge. Baptist does not know how to write. All such of my readers as have passed through the paradise of youth will readily divine, without my telling them, whither the steps of Baptist led him against the bent of his wiser intention. As full of wine and passion as an elegy of Propertius, with his fiddle under his arm, and his Anna in his heart, and with as good speed as the obscurity of the hour, and the ruggedness and strangeness of the way permit, there he goes, entreating the solitude to favor his blind search of the temple of his divinity, and already, in spirit, making the tour of those walls which he fancies he discovers in every white stone that he discerns before him.

And what a wretched gratification is he seeking ! He will not see her ; no, he will not hear her voice. At such an untimely season of the night, he will not even, through some compassionate crack in the door, have his eyes fascinated by the flickering gleam of a lamp lighted by that very hand which so lately trembled in his own. She herself will not know to-morrow that he has been keeping watch near her, and surrounding her dreams with his love. No sign will remain to reveal to her the devotion with which he will have been kissing, as a pilgrim kisses a reliquary, the insensible walls that enclose the talisman of his existence ! When she shall arise and go forth with Aurora, placid and rosy like her, and, like her, hailed with delight by everything that beholds her, not a vestige of his kisses will be left on the stones of her house, on the threshold of her door ; not one of all the sighs that night shall have gathered in its lap will be felt with the morning breezes, as they sigh among the foliage. No ; but he will have enjoyed, in three or four hours of careful vigil, whole ages of felicity. It is even possible, that something of reality may be mingled with his delicious reveries : it may chance, that, while with ear applied to a casement, and breath suspended, he interrogates the silence of the sleeping house, some audible sound, some word addressed by the daughter to her mother, some rustling of the mattress, stuffed with the straw of Indian corn, will aid his fancy to picture the interior of that Eden, and to perceive, as it were, through his ears, the position, the attitude, the expression, the thoughts, of the most beautiful of slumberers. He will, at least,

hear the bleatings of her goats hard by ; and, if the stars be not utterly hostile to his hopes, he may, in the morning, hiding himself where he cannot be discovered, watch her as she passes with her flock, blithely treading the dew in her little slippers of orange-tree wood, her distaff stuck in her girdle, a shade of soft anxiety setting off the sweetest smile that ever dawned from under the broad flap of a large black hat ; and, perhaps, he might hear that chant of the mountain, and now, more than ever, the song for *him*, sent forth to the echoes by the most bewitching voice of the *Beira-alta*—

Oh, life of my life !
Who can show me your fellow
At fiddle or fife
On the mountain Estrella ?

As these fancies thickened upon him, Baptist, who was absolutely carried away with them, and was every moment quickening his pace, less attentive to the road than to the stars, with which true lovers have always an undefinable sympathy, suffered himself to be hurried on, he hardly knew whither, till he suddenly remembered—what none but a lover would have forgotten for a moment—that he ought to examine, by the notices which he had been warned to take heed of, whether he was on his right course or not. He stopped, he doubted, he was about to turn back, when lo ! he observed, on the side of the path, certain trees, which might very possibly be the two oak-trees : he flies towards them ; they are the very same ; and that is the exact site—a site as familiar to him, now that he views it for the first time, as if he had been born there. He accelerates his speed—his heart leaps as if it wished to get there before him—the sandy and barren soil of the steep seems to him a gentle declivity, matted with rose-leaves ; and, to crown his success, he hears the bleat of a lamb close by : he who hears the lamb cannot be far off from the shepherdess. He rushes towards the spot where so tender a greeting invites him. He already discovers the withies of the fold—he almost touches them. All at once the ground gives way under him, and he finds himself at the bottom of a pitfall. Astounded with the shock, though he had lighted on his feet, with his fiddle safe under his arm, he at first imagined that some evil witch had laid this wicked trap for him ; and he now called to mind that an old woman at the wedding had very constantly eyed him with an expression of countenance of no good augury :—but after his first confusion was a little allayed, he perceived that he was in one of those deep holes which it is the custom to excavate on the mountain to catch wolves. These holes are made wider at bottom than at top, so as to make it impossible for the prisoner to escape ; the mouth is lightly covered with a few slender boughs, which, yielding to the pressure of any weight, let it fall through, and being elastic, resume their deceitful appearance : as a lure to the beast of prey at night, it is usual to place behind this masked abyss, and within a strong fence of hurdles, a kid or a lamb, whose cries for the dam entice its enemy to certain destruction. The hopelessness of evasion from such a den, for the rest of the night, was evident to poor Baptist. He tried to accommodate himself to his situation. He had not room to console himself, as men incarcerated are wont to do, by pacing to and fro to give life to his imprecations. He laid himself

down in the pit to meditate on the abode of his love, which he had left above him in the land of the living. Nature makes but little difference between dreams and the visionary cogitations of lovers.

Baptist was now half-musing, half-sleeping, when he heard the treacherous roof of his den giving way again, and immediately afterwards down plumped some heavy substance. He jumped up in consternation—Who is there?—no answer.—With hair on end, head dripping with cold sweat, and tongue tied with terror, he crouched hard against a side of the pit, and endeavored with eyes fixed in stupid amazement, to make out the companion of his misfortune.—and lo, a wolf, a great wolf, an immense wolf! He sees his eyes glaring like lamps, and that ferocious light shows, or seems to show, two rows of perfectly white teeth, with the formidable tusks; a sight sufficient to disconcert, not only one fiddler, but a whole philharmonical society. Without defence, or means of flight, or chance of succor, and watching the steady and gradually emboldened attention with which his adversary measured him, he was attempting in his agony to shrink into the very earth that immured him, when an involuntary touch of one of the strings of his fiddle caused it to sound—the animal was startled and recoiled two steps, which he had at last slowly and with a long pause between each made towards the musician. Baptist, therefore, suspecting that there may be some occult centrifugal virtue in the art of Orpheus, draws his fiddlestick with a tremulous hand across the bow. It is now the wolf's turn to shrink; he cowers as if he would bury himself in the ground; the rage in his eyes is subdued; he turns away his head; he manifests his fears by a thousand signs. Baptist, gathering courage from his enemy's cowardice, without farther preparatory tuning, flings him off a waltz, and, observing that the first effect of his instrument is in no wise diminished, overpowers him with an inundation of notes, in tune and out of tune, enough to rive the entrails of the earth. It was a genuine scene, worthy of the opera in the Rua-dos-Condes. Minuets, gavottes, country-dances, waltzes, cotillons, jigs, and rigadoons, succeeded one another without break or transition, and with a rapidity, a prodigality, that was marvellous; while now and then he wrenched his eyes off his crouching adversary to look up at the aperture for the glimpse of day, to which alone he could trust for his deliverance. But that night had sworn to last at least fifty hours, for the poor fiddler. The centrifugal charm of his violin appeared to have as much influence on Aurora as on the wolf; keeping them both aloof. The perspiration which his fears had at first drawn, was now streaming down him from sheer fatigue. His arm, before so laboriously exercised at the ball, was beginning to fail him, when at last the gleams of day peered through the false trellis-work over his head; and soon afterwards, steps, voices, and laughter, were distinguishable near the cavern. The shepherds who had laid the trap were coming to see if they had caught anything; and wondering at the strange subterranean music, they hastened towards it with a thousand wild conjectures. Having removed the boughs that covered the mouth of the pit, they looked down, eager to learn what this extraordinary revel could be. Baptist, fearing to lose, by one moment's intermission of his music, the safety he had won at so much cost, answered

them in chanting prose, fiddling all the while, and huddling two or three words into every note—

“Pit of terror—Night of horror—How I tremble!”

entreating to be quickly released, and intimating that he would tell them all about it presently. A ladder was the first thing to be procured; one was immediately found in the nearest farm-house, the inmates of which, as anxious as their neighbors to gratify their curiosity, came running with the rest to witness such an unexampled sight. The pit was surrounded with people of both sexes. The ladder was hardly fixed, when Baptist clambered up as fast as he possibly could, without the use of his hands—for he was still fiddling—till he reached the top, more dead than alive. Scarcely had he found himself amid kindly human faces, and in the light of one of the loveliest mornings that ever shone on the Estrella, when, laying down his fiddle to make the sign of the cross, he discovered at his side his own Anna. Hers was the ladder that had saved him; hers the neighboring farm-house; and the soft scarlet kerchief of cotton, that was instantly offered to him to wipe his forehead, was taken from her own neck.

He was conducted to her house, (it was possibly only because it was the nearest at hand,) and placed by the hearth, where mother and daughter vied with each other in making him comfortable, and, after serving him with a good breakfast, and giving him a thousand unequivocal proofs of their benevolence, they left him to take five or six hours of delicious repose on a well-filled and well-smoothed palliase of Indian-corn straw.

In less than three months after that breakfast, Baptist was the husband of Anna. The artist who had figured so brilliantly at other people's wedding-parties performed prodigies at his own. The wolf, which Baptist and Anna would not suffer to be destroyed, was carefully secured; and, being of a tamable age at the time of his capture, is now a part of the family, and is kept in better condition than ever wolf was kept before. The friendly evening gatherings at this farm-house are celebrated in the district; and all the neighbors hope and trust that the harmony which reigns there will never be interrupted—that, in the mutual relation of husband and wife, and of mother and son-in-law, the fiddle will never be out of tune.

From the London Times, of April 23.

POLITICS OF THE AMERICAN CONTINENT.

THE discussions now going on in the Republic of Texas between the American party which seeks to be absorbed in the federal union of the American states, and the national Texan party, which upholds the independent interest of the new state, are matters of the deepest interest not only to the annexation question of the present day, but to the future destinies of the continent of North America. If Texas at once flings away her national existence, and makes herself subservient to the policy of the United States, it is highly improbable that any other new state will attain to independence in the southern regions of North America, and the progress of the dominions of the cabinet of Washington will be as rapid as the decay of its defenceless and ungoverned southern neighbors. More than 20 years have elapsed since Mexico threw

off her allegiance to Spain, and during the whole of that period the decline of the nation has been inconceivably great and rapid. The result is now pitiable. The country is stated by a recent observer to be as defenceless as it was in the days of Montezuma. Another Cortez might march with a few hundred men upon the capital; and as for the northern and western provinces, more especially the magnificent territory of California, since the sequestration of the missions and presidios, they are without even the semblance of a government. The whole white population of California is hardly more than 5000, scattered over 2000 square leagues of territory: the Mexican administration does not even communicate with the province; and to conquer the whole of it would not be more difficult than to take possession of a desert island. In these thinly peopled regions the inhabitants are manifestly unable to defend their territorial rights; and when they have lost the protection of a great power, whose policy is jealous of all encroachments on the future interests of its subjects, they fall an easy prey to a sort of retail invasion, until the sovereignty of the country is filched away before an effort has been made to challenge the assailant.

The eager, gain-seeking and roving population of the Western States of the Union are fitted beyond all the rest of mankind to carry on this kind of surreptitious warfare. They conquer provinces as the cuckoo steals a nest; and if their irregular enterprises be allowed to carry with them all the political consequences of lawful war, it is evident that at no very distant period they will have made themselves masters of all such parts of the North American continent as are not defended by the forces and the resolution of Great Britain. But the conduct of Texas in the present emergency will determine whether these political consequences are to be realized. It depends on the acceptance or rejection of the proposed measure of annexation by the people and government of Texas, whether every fresh step of the Anglo-American race is to add citizens to the Union; or whether the new states which may be formed in course of time on either shore of that vast continent may not uphold an independent flag, independent interests, and an independent policy.

When we take into consideration the position of Texas, the decline of Mexico, and the future condition of the unappropriated lands, rivers, and regions lying between the coast of Upper California on the Pacific Ocean and the Rio Bravo del Norte, it is impossible to doubt that such a country ought to possess an original character and an independent existence. Its annexation to the United States, if that measure be consummated at the present time, would only lead the more surely to the eventual disruption of that wide and imperfectly-united confederacy, and to a struggle which would prove injurious to the best interests of the whole continent. But Texas independent is peculiarly qualified to interpose, as it were, the keystone of an arch between the United States and Mexico, on the one hand, and between the maritime interests of European and American nations on the other. These views are so clear and evident that they will probably have a decisive influence on the executive government of Texas, provided the Mexicans can be brought to recognize in a liberal spirit an arrangement which is the sole guarantee of their national existence. Nor can we believe that this policy will be defeated by the popular emissaries

of the United States in Texas, who are avowedly engaged in promoting the work of annexation solely with reference to the interests of their own party in the United States, and to the cause of slavery with which that party is identified.

The part taken by England and France in this question—for we are happy to find that the most entire concurrence prevails between the two great powers by which Texas was first recognized in Europe—has been dictated by no such selfish or exclusive objects. To them individually the annexation of Texas offers no very formidable dangers, and her independence promises no very certain or conspicuous advantages. But they are actuated by a sincere desire to uphold in America that respect for territorial rights which is the only sure basis of peace; and in maintaining the independence of Texas they may hope to establish an important element in the distribution of power over North America. There as well as in Europe an universal dominion is impracticable.

If, however, the annexation party be successful, and the patriotic intentions of the President are defeated by the foreign party in the commonwealth of Texas, that only opens the door to fresh difficulties of the most serious character. The claim of the United States to Texas is a claim studiously undefined, and purposely obscure; but once admitted, it would be found to embrace the distant objects of American ambition, even on the shores of the Pacific. Already several attempts have been made by the ministers and officers of the United States to obtain the cession of the great harbors on the coast of California. In 1835, Mr. Forsyth offered to the Mexican government five millions of dollars for the port of San Francisco—one of the finest naval positions in the world; and a few years later an American commodore actually seized, on some pretended rumor of war with Mexico, the town and harbor of Monterey.

The time is now rapidly approaching when the western coast of North America—hitherto the least peopled, the least productive, and the least frequented portion of the globe—will become the scene of great political interests, and will gradually be animated with the stir of nations and the activity of social life. The United States are seeking to subject these future races and states to their dominion, and without an army or any of the ordinary instruments of conquest, to extend their sovereignty over nations yet unborn. The scheme for the annexation of Texas is the most decided step they have made in this direction; but this is only the prelude to their ulterior designs. The claim to the exclusive possession of the Oregon territory is another indication of the same policy; it will be followed by an attack, either by force or by fraud, on California. On all these points the same unlimited spirit of aggrandizement prevails. For the protection of the British dominion in North America ample means exist; and, indeed, the possession of the Oregon territory by the Hudson's Bay Company, under the joint conditions of the convention of 1818, is practically conclusive on the point. But in provinces in which no European power has any direct concern, the only check to the rapacious encroachments of the United States will be found to consist in the establishment of another energetic and independent power to share the dominion of North America; and such a power we still hope Texas may become.

From the Foreign Quarterly Review.

Catalogue des Tableaux composant la Galerie de feu son Eminence le Cardinal Fesch. Par GEORGE, Commissaire-expert du Musée Royal du Louvre. Première Partie; première et seconde vente; à Rome, 1843, 1844.

FATAL as her gift of beauty has been to Italy, it has brought her many compensating benefits. Her bright skies, her balmy climate, her luxuriant vegetation, her fair cities, her gorgeous temples; her ruins ennobled by glorious memories, and entwined in the graceful garlands of prodigal nature; her statues and her paintings, the proud creations of man's genius and imagination;—these have, alas! too often attracted and enriched the spoiler. But have they not also cheered her sons, even in the saddest hours of their sufferings? Did they not preserve to her, through the long night of the dark ages, those dormant sparks which, in better times, diffused the light of civilization over Europe? Have they not imparted to her children that susceptibility of refined taste, that perception of the beautiful, which assuredly, in a land teeming with beauty, afford unailing solace? These features in the national character of Italy cannot fail to strike all observers, for they prevail from the palace to the cottage, though variously developed. The hierarchy of Rome, the merchant princes of Venice, the successive tyrants of the minor communities, built for themselves palaces, and called in the best sculptors and painters to adorn them. The craftsmen associated themselves to erect churches and found chapels, which they made shrines of art as well as of piety. The peasantry adopted costumes, whose rich hues and happy combinations are still favorite ornaments for a fashionable masque. Even among the humblest classes, the same turn for the picturesque is involuntarily manifested. Observe the tattered *lazzarone* asleep in the vestibule of a Neapolitan church, the fishermen of Baja stretched on that secluded beach, the shepherd of the Campagna gazing over the desolate plain; their ragged vestments, their rough sheep-skins assume an originality of character, their attitudes manifest a pictorial effect, which the inspired artist is glad to copy, hopeless of improving upon them. We have seldom enjoyed a greater treat than in looking over some studies of the late Baron Camuccini, the first Roman painter of our age. They consisted of groups slightly shaded in water-colors, designed with a purity and accuracy worthy of the *cinque-cento*. There were warriors in action, cottage groups in repose, inspired Madonnas, joyous children, smiling babes—in short, every variety of figure composition, conceived and executed with almost faultless taste. To our surprise the baron said that each was strictly a transcript of Italian nature. In his walks, he had the habit of hastily jotting down every striking attitude or picturesque combination that met his eye, and every evening he embodied these fugitive ideas, accommodating them to any subject or character they might appear to suit. Alas! that he had not drawn more largely upon these materials in composing his historical works!

If Italy be the mother of arts, the Italians are their children. In England, conversation is monopolized by politics and the weather; in France it is sustained by the theatres; in Italy it is of the fine arts. Hire an apartment in Rome, and hang your walls with pictures, few of your English

visitors will ever be conscious of their existence; but the people employed to arrange or pack them, your servants, the tradesmen who chance to enter, will ever be ready with an observation dictated by the interest they feel in your tastes, and by an intelligence, misdirected it may be, but, at least, awakened. Whilst residing among a people who thus inhale taste as with their native air, and surrounded by monuments of genius, it is not difficult to imbibe a sympathy with such feelings. From admiring to acquiring is an easy step, but one which should be taken with discretion. Those who can afford to pay dearly for their experience may yield to a momentary impulse of fancy, and purchase pieces which they will soon part with at any sacrifice. But others, with greater prudence, or smaller means, will form, and to a certain point cultivate, their taste ere they begin to gratify it. Even persons who, in England, had some pretensions to connoisseurship will do well to observe the like caution, for in Italy their ears will be confounded by new names and schools previously unheard of, in connection with works of high merit and unquestionable attractions.

Why in this age of hand-books have we none for the business of picture-dealing? Its mysteries, if unequal to those of Paris in variety or thrilling emotion, might well fill a volume with curious and instructive gossip. For such a compilation an opportunity has recently occurred, which will, perhaps, never recur, but which, we fear, no pen was at hand to seize. A cardinal prince of Rome, uncle of an emperor and of four kings, devoted the latter half of a very long life to the purchase of pictures, as the grand object of existence, and left behind him the most numerous and valuable collection on record as accumulated by one individual. Had his eminence noted the circumstances under which most of his acquisitions were obtained, little more would have been wanted to illustrate the ways of picture-getting. Were the means adopting, or yet to be adopted, for dispersing what he so indefatigably amassed, to be displayed to the world, the mysteries of picture-dealing would be laid bare.

Of the Fesch pictures a comparatively small portion formed the cardinal's show gallery, the fame of which depended chiefly upon those of the Dutch and Flemish schools. Specimens in that style, of at least equal beauty, may be found in England, France, and the Netherlands, but no similar collection ever appeared south of the Alps. The Italian rooms, on the other hand, though including many *chefs-d'œuvre*, could not stand the comparison so readily drawn between their treasures and those of other neighboring palaces. The cardinal began to form his museum in France, when the property cast loose by the Revolution, and the spoils of half Europe, were to be gathered with little trouble, and at moderate cost. Having afterwards, in common with the rest of his family, found that country no longer a licensed residence, he naturally sought a home in the metropolis of his church, and on transporting his pictures to Rome, he stipulated for their removal, at pleasure, from the papal states, exempt from the usual restrictions or export duties. To the choice productions of the ultramontane schools which the collection already possessed, the constant augmentations which it subsequently received added but few gems, and these from Italian pencils. The cardinal had little more to wish for; eminent rank and ample wealth were his, and the picture-gallery

he was intent on forming had attained a European reputation. But the desire of acquisition had become a chronic disease, ever gaining force in its inroads upon his means. Not long before he died he negotiated with one Roman picture-dealer to pay for some indifferent pictures with his service of Sèvres china, representing the battles of Napoleon, sets of which were made only for the emperor's nearest relations. To another he gave a set of silver plate by a similar transaction, and at length death itself snatched away the octogenarian from some uncompleted bargains. But his craving for canvass was not to be satiated even by wholesale dealings, which at once added hundreds to his pictorial investments. There was an understanding in his household, that for every picture offered at his palace, however execrable in merit or condition, four pauls (about twenty-one pence) were to be at once given. To clean and patch up these, he gave permanent employment to several young restorers, and many were the guesses as to what became of the bargains, after emerging from their hands. During the residence of his nephew, Joseph Bonaparte, in America, it was a common belief that they were shipped to the new world, and there converted into cash. When, on the cardinal's death, the mystery was revealed, endless repositories of pictures were discovered, the exact number of which has not been, and perhaps could not be, ascertained, but it is estimated at 18,000 or 19,000.

The inconvenience of such an inheritance was much felt by those intrusted with the payment of his eminence's testamentary bequests. His capital was not only unproductive, but it was sunk in a commodity costly to keep in order, of most fluctuating or even fanciful value, and liable to great depreciation if hastily realized. A portion, said to amount to above 3000, and composed chiefly of copies, was left to a college at Ajaccio, in Corsica; the remainder was to be sold. The executors very wisely resolved, in the first instance, to attempt disposing of them in the mass, demanding for the whole above 200,000*l.* After some time an offer was made approaching to half that sum, and another overture was received, of about 45,000 guineas for 500 pictures, to be selected by the purchasers from the collection, but excluding the Dutch, Flemish, and French schools. The parties to these offers were French dealers, and both were declined. Two years having been thus lost, it was resolved to disperse the whole by auction, and Mr. George, of Paris, who was called in to arrange it, undertook to finish a complete descriptive catalogue within a stated time, under a heavy penalty. But whilst his herculean task was in progress, two public sales went on of above 1000 pictures, the lists of which are prefixed to this article. The newspapers of Europe were employed to puff and advertise the auctions, in terms which inferred, that the whole, or at least the gems of the collection, were on each occasion to be brought forward; and in this belief amateurs and agents flocked to Rome. But on both occasions the works produced were only an average of the mass, set off by some twenty or thirty good pictures. The sales, accordingly, gave little satisfaction, no order being observed in the exposure of the articles, and the bidding-up system being largely resorted to. Notwithstanding much dissatisfaction about 7000*l.* were realized, and the prices, especially on the former occasion, were such as only the cardinal's name could account for. But should these tactics

be continued, during the years which must elapse ere the remaining 11,000 or 12,000 pictures can be disposed of by partial sales, the curiosity and patience of the public must fail, and the auction rooms be deserted: indeed, persons experienced in such matters already estimate the probable produce of the whole collection at a sum not exceeding what has been refused for 500 of its principal works.

The sale of the Fesch gallery now in progress is a sufficient answer to the very frequent remark of picture-dealers north of the Alps, that there are no longer works of merit to be purchased in Italy, although their assertion has a certain plausibility, if the actual state of the market there be compared with the immense supplies it has sent forth within the last forty-five years. Since the revival of art, that country has been the great cradle or school of painters for Europe, and a vast proportion of the pictures required for religious or ornamental decoration, has emanated from her studios, galleries, or churches. From thence came the gems which Charles I. contrived to accumulate, notwithstanding the difficulties of an empty treasury and a troubled reign. There did the stately Arundel, the earliest English virtuoso, resort. France and Spain, for three hundred years; England, Germany, and South America, during the last century, have been working the same mine. After the disastrous occupation of Italy by the French, in 1798, and the subsequent convulsions of that ill-fated land, the sword of France and the gold of England, combined to cull from her temples and palaces all that was most choice in this branch of art. Since the peace the drain has been continued, and though fewer pieces are now sent out for devotional uses, a new demand of amateurship has arisen from Russia and the United States; nations till then unknown in the market, while England is annually glutted by traffickers in old canvass and cracked panels. Yet the competition of these rival purchasers may, with a little dexterity, be accommodated, as their principles of choice do not by any means clash. The Russian taste in pictures, as in equipages and jewelry, is regulated rather by a semi-barbarous magnificence, than by refinement, and their expenditure is in proportion to their colossal fortunes. Provided a picture have the name of a great master, and a corresponding price, the wily Italian owner may also calculate upon transferring it in the course of the season to some Russian prince, although the subject be forbidding, the treatment mean, the restorations ill-disguised, or even the authenticity questionable. As to our countrymen, few having sufficient reliance on their own judgment to deal with foreign venders, whom they in general look upon as limbs of Satan; they usually prefer making their purchases from their own countrymen, content to presume them the honestest of the two. Nowhere can an undisputed and uninjured *chef-d'œuvre* of a great name command the same ransom as in England: but whenever it is a question of school-copies of such, however fine, or of second or lower class Italian productions, or names less trite in the limited *abecedario*, with which most English amateurs are conversant, these gentlemen button up their pockets or higgles at a sum which a Russian would readily quadruple. Of the class of pictures now largely exported to the United States, it may be sufficient to mention, that a commercial traveller in that line, who came to Rome in 1837, had a commission to buy up any painting of whatever

subject, or whatever substance, and in whatever state, not exceeding the price of sixteen pence! Akin to this is a variety of British Colonial emigration, which may be new to our readers. Chancing to visit lately at the close of the season, the ware-rooms of an obscure London picture-dealer, we found them encumbered with the refuse of various auction rooms which had evidently been bought up on this Yankee principle. Whilst gazing in astonishment at the rare conglomerate, we were informed that they were a speculation for Botany Bay!

There is a consideration suggested by the incredible number of paintings produced in Italy during the last five centuries, which ought not to be lost upon our money-getting generation. The sums which during that long period have been and still are sent there, in payment of exported pictures, have afforded incalculable national wealth. Let not this be forgotten by penny-wise legislatures, who would measure the beautiful by the scale of utility, and estimate genius and its highest productions by the returns of the outlay on their raw material. Let them remember that trifling sums now doled out for the improvement of public taste, and the encouragement of art, are surely and profitably invested; and that nothing but the inadequacy of their amount can prevent them rapidly yielding an almost usurious interest. Could our own school of painting be raised to the perfection attained by those of Italy in the sixteenth, and Flanders in the seventeenth centuries, what need were there to send abroad our annual thousands for the purchase of their works? Or, were our designs as tasteful as the French, why should our neighbors export their fashions and fancy goods, to eclipse ours wherever civilization has penetrated? These matters are now beginning to be understood among us; much still remains to be known, and far more to be done; but it is well to have at length entered upon the right path:—*sero*, let it be *serio*.

Another inference from the superabundance of old pictures in Italy is, that amongst so many, much that is good may still be gleaned. From Bologna alone, thousands have annually been exported, since the end of the war, and yet the town seems full of them. After spending three days among the sale galleries there a few years ago, unless the number was grossly exaggerated, we must have had nearly 10,000 pieces in our offer. Indeed, one man estimated his stock at half that number! Add the quantity scattered among private houses in town and country, where every artisan and tradesman have their *quadretti di divozione*, as with us they have their Bible and prayer-book; recollect that there nearly everything may be bought; and judge whether there is not still plenty to be had beyond the Alps. The acquisition of really excellent pictures there, is, however, a matter of increasing difficulty. Most of the few rich galleries that remain intact are secured by entail, or by the wealth and pride of their owners. From time to time indeed, such barriers give way, and some fine collection is dispersed, yielding prices not to be obtained in other countries. Now and then too, the death or exigencies of a collector, who knew how to profit by the chances of revolutionary times, sets free a few brilliant bits. These opportunities are, however, insufficient to account for the number of good works in the trade, which is one of the most conclusive testimonies to the

inexhaustible fund of talent displayed by the old masters.

Fine old pictures are even now ever turning up, and it would be endless to give instances. One, however, of the details whereof we happen to be cognizant, may be taken as a specimen. Marsupini, secretary of the Florentine Republic, who, by a combination of talent, frequent in the fifteenth century, rare in our degenerate days, was at once a philosopher, a poet, and a politician, testified his devotion by founding a chapel in his native Arezzo, and commissioned for it an altar-piece from Fra Filippo Lippi. This picture, stolen during the French occupation, came by inheritance to an ignorant woman, of whom one Ugo Baldi, a dealer from Florence, bought it some two years since for seventy crowns. He soon after handed over his bargain to Baldeschi, a Roman dealer, for 80*l*.; and from him it was bought for the gallery now forming in the Lateran palace, nearly 300*l*. being paid by the papal government; a handsome profit, but a moderate price, for the intrinsic merit of the work is enhanced by the historical interest of the donor's and his brother's portraits, introduced as subordinate figures. A very different fate has befallen a contemporary production, painted by Sandro Botielli, at the dictation of Matteo Palmieri of Florence, and included in the denunciation of heresy against the latter, which is one of the most remarkable pictures of the age. Having been seized by the French, it was deposited in the gallery of the Belle Arti in that capital; but was eventually reclaimed as family property. A few hundred dollars would at that time have secured its remaining there; but this the Tuscan government foolishly grudged, and the picture having been cleaned and talked of, has now gradually attained the price of about 1000*l*.

Verily if there be tricks in all trades, that of picture-dealing is not the purest: yet great allowances must be made ere we bring sweeping accusations. No other commodity is equally liable to the fluctuations of whim and caprice. Its genuineness, when doubted, becomes matter of conflicting evidence, without the possibility of satisfactory demonstration: its intrinsic value is just what it will fetch in the market. It is a speculation in which there is nothing positive but realized profit, and the best knowledge is that of selling to advantage. Hence the prevailing ignorance of art, in an extended sense, among most of the tribe who trade in it, and whose gross blunders are frequently ascribed to knavery. Even those of them who have an educated eye, seldom aim at anything higher than the experience of what is vendible. It has often been contested, whether most reliance should be placed upon the judgment in pictures of a painter or a connoisseur; the former, although more familiar with the mechanical part of the subject, being thought liable to be warped by narrow views of art. So far as our own observation goes, we should award a preference to those painters who have taken to dealing extensively in the old masters, and to restorers who have passed a great variety of superior works through their hands, such persons on the continent having a more extended experience than with us.

It is not our intention to supply such as wish to invest a portion of their wealth in the most rational as well as attractive of ornamental furni-

ture, with a defence for their credulity and their pockets, out of the somewhat extensive acquaintance which we have chanced to form, abroad and at home, with those whose vocation it is to administer to that appetite. A few hints may not, however, be out of place. The best general rule for a collector to avoid buying experience at a high rate is, of course, to study the most important schools of painting, and the best masters, both through books and their most authentic works, and also to examine and "price" many pictures ere he begin to buy, either on his own judgment or that of any one else. To those who acquire pictures as a matter of fashion, or as mere ornaments, without caring much for their price, no plan can be better than that of commissioning a respectable and skilled dealer or artist to find for him such as he wishes. But this is necessarily a costly plan, for the agent's ten per cent. on his outlay cannot quicken his zeal to buy at a low figure, nor will many true amateurs transfer to another, what is, after all, the chief interest and gratification of their pursuit, the pleasure of seeking out their purchases.

Setting aside the more difficult question of its authenticity, there are certain faults and qualities which ought to secure the rejection of a picture by amateurs of taste and feeling, besides the merely technical ones of bad execution and defective preservation. Among these may be mentioned, a subject in itself painful, or treated in a manner revolting or mean; a picture unpleasing in shape or effect, in whose *ensemble* there is some obvious defect, such as the shadows darkened by time acting upon a bad ground. Unfinished pictures, though often of infinite value to the student, are seldom satisfactory additions to a select cabinet, and over-painted ones are speculations to be touched with caution. On the continent, fine old or school copies of *chefs-d'œuvre* are much prized, and are certainly far more deserving of attention than careless originals bearing good names: in England, however, the epithet *copy* is, in the slang of ignorant connoisseurship, a stain confounding all degrees of merit, and which no intrinsic excellence can efface. It is scarcely necessary to say, that no collection can become choice without occasional weeding, when opportunities of substituting better specimens occur.

Those who find amusement in collecting pictures, will do well to remember that the price demanded has usually but a remote analogy with the sum that would be gladly accepted, whether by dealers or private parties. It is especially so in Italy, where almost every family has something of art which they are anxious to turn into cash, and where a class of small agents of very questionable reputation, are always ready to lead a stranger through rooms of rubbish dignified with the title of galleries, or to exhibit to them, under a cloud of mystery, a pretended Raffaele. Purchasing out of private houses is, indeed, seldom pleasant. Apart from feelings of delicacy, in most instances misplaced, one has to contend with the natural tendency of the seller to over-estimate a perhaps favorite object, which is usually exaggerated by his thorough ignorance of its real value. No doubt that from such people, when pressed for money, a prize is occasionally obtained at an utterly inadequate price, but it is much more common to find in their hands worthless trash treasured, in roguery or ignorance, as *chefs-d'œuvre*. We have sometimes amused our-

selves by selecting the very worst specimen from such a lot, to ask "How much!" when at once some hundred crowns would be named, for what, at a stall, would scarcely bring a dollar. The smile which it was impossible to repress, would be answered by, "Who knows but it may be worth as many thousands! My father once sold, for five crowns, a Madonna, for which five hundred have been refused by the fortunate purchaser." Many similar anecdotes might be mentioned; one may suffice. A Scottish baronet, whose purse was presumed to outweigh his connoisseurship, and who was consequently beset by importunate vendors, at last condescended to look at some daub brought to him at Milan, and even to ask the price. The Italian's eye kindled with joyful anticipation, and in a voice trembling with ecstasy he exclaimed, "Cento mille scudi!"—a hundred thousand crowns, being the highest amount to which his arithmetic could carry him. To almost equal ignorance, another class of amateur sellers add an immoderate share of impudence spiced with cunning. If, on entering a house, you are assailed by multiplied expositions of the vast advantage of buying from private owners, (*Signori*, of course,) with frequent protestations that your present company are such, and no dealers, you may look for imposition so barefaced, and prices so preposterous, as to defeat the object in view, and leave your purse scathless.

Upon the whole, it would seem that one can buy on better terms and with equal safety from dealers, though in such affairs the hundred eyes of Argus would be far from superfluous. The varieties of their fraud, from the random assumption of a great master's name, to the elaborate fabrication of a fine old picture, were an endless theme. Many tricks, such as ascribing the work to some noted gallery, the solemn asseveration that no one else has yet been permitted to see the treasure, or the casual hint that Lord Somebody has come down with a handsome offer for it, have been generally discarded as too transparent for our sharp-witted generation. There are, however, "three artful dodges" in especial favor among Italians, to whose dexterity of resource and effrontery of falsehood, every other people must yield the palm. These we shall distinguish as the "dodge candid," the "dodge confidential," and that by *coup-de-main*, and shall shortly illustrate each.

When you ask an Italian the price of any commodity which he is pressing upon you, he is in most cases at once struck dumb, puts on the air of a man totally unconscious of your question, and waits until you repeat it. He then, probably, resumes his interminable laudation of his wares, without vouchsafing you an answer. The proper way to treat such a fellow is to walk quietly away; but if you have patience once more to make the inquiry which he so anxiously evades, you will perhaps only have your words echoed, and followed by another pause. Now the purpose of all this by-play is to gain time for estimating the utmost limit to which he may venture upon your ignorance, credulity, and purse. When you have gone through such preliminaries with the "candid" picture-dealer, and fairly brought him to bay, he assumes his most insinuating frankness of manner, and solemnly says, "Hear me! that picture cost me a hundred crowns." As you have by this time probably made up your opinion

that it is worth scarcely half that sum, you pass on and dismiss the matter from your mind. Not so Candidus, who, much crest-fallen at finding his studied frankness in telling what you have no right to know has failed to hook his gudgeon, recalls your eyes to the picture, and hesitatingly asks what you will give. Having no wish to insult the man by supposing he will take less than a fair profit upon an outlay already beyond what you would have given, you waive the subject and beat a retreat. But now a new energy inspires Candidus, who presses you so hard for an offer, and says so much of his wish to sell, that, to get rid of his importunities, you name sixty crowns, in the conviction that you are quite safe. He staggers, sighs, and at length mutters *à poco*, "that's little." With these words your fate is sealed; for, even after you have bowed yourself out, he follows to say the picture is yours. You begin to doubt your low estimate of its worth, and take it home half triumphing in your bargain. Could you see the debtor and creditor aspect of the transaction, it might stand *nominally* thus:

<i>Dr.</i>	<i>Cr.</i>
A small Cleopatra, school of Guido, to cost thereof, viz., By value of the Cleopatra,	100 0
A landscape, supposed by Lucatelli, cost me three dollars, but was worth, say, . . .	60 0
Cash paid with the same,	5 0
Cash paid for cleaning and framing the Cleopatra,	3 0
To balance, being my nominal profit,	32 0
Dollars 100 0	Dollars 100 0

But from these materials it is easy to extend the *true* state of the account as follows:

<i>Dr.</i>	<i>Cr.</i>
To total outlay for the Cleopatra,	110 0
To profit realized on the sale,	49 0
Dollars 60 0	Dollars 60 0

Upon nearer inspection, your Cleopatra turns out a middling copy, worth about as many shillings as you have paid crowns, so that it has cost you ten pounds to learn the extent of an Italian dealer's "candor."

The "dodge confidential" assumes as many forms as Proteus, but they are all shrouded in mystery. Certain pictures are casually alluded to as attainable by a dealer or amateur broker, (a count, perhaps,) who seems suddenly to recall his words, and changes the subject. From curiosity or otherwise, you return to it, and his voice immediately sinks; he whispers unintelligible allusions to certain objects of extraordinary value never previously in the market, and which from peculiar circumstances cannot now be shown there; hints distinctly at property withdrawn, under the rose, from the fetters of immemorial entail, to meet the wants of a princely house, or talks wildly about plundered convents, or even mutters something as to royalty raising the wind. When you propose to look at the treasures many difficulties are made; a certainty is thrown out of the sale being stopped by government if even suspected; and, finally, an appointment is made under seal of secrecy. It is scarcely necessary to say that when, after long

ambits, the mysterious gems of art are displayed, they prove chiefly remarkable for tinsel frames and ransom prices.

Among the cleverest of the Roman picture-dealers is Signor A., a most fair-spoken fellow and facetious withal, who, conscious of his own talent, is ever ready to adduce some instance of its happy exercise. 'Tis but a year or two since he made a wholesale transaction, which in a short half-hour, transferred to a young Irish peer the accumulated rubbish of his magazine. At the lucky moment of *milor's* visit, there arrived a liveried servant with an official-looking missive, which A. apologized for opening, and after glancing at it, said "Very good, but I have no time now to look at your pictures; come again." The servant hesitated, and to the inquiries of the stranger, A. said it was only the particulars of a lot of pictures which had been sent to him for sale, the heritage of an old Bolognese family, but that he had never had leisure to open the boxes, which must stand over till he could attend to the matter. On his lordship pressing to have a sight of them, A. reluctantly opened the cases, protesting that it was of no use, as it would take much time to clean and arrange and value this collection, before which, of course, the pictures were not for sale. The list exhibited Guidos, Domenichinos, Caraccis, Carlo Dolces—in short, just that class of names which impose upon an Anglican amateur—and the dingy canvasses were freely acknowledged to be so completely obscured by dirt and old varnish, that their merits were undistinguishable. The more the dealer seemed anxious to divert his customer to the brightly varnished ornaments of his own walls, the less willing was he to lose sight of this singular chance of procuring "a genuine gallery ready made," and ere the parties separated, a transfer was made to the peer of a mass of trash which scarcely merited the outlay of cleaning, in exchange for a thousand louis-d'or.

A still bolder *coup-de-main* was successfully played off by the same worthy some years before, at the expense of an experienced purchaser and acknowledged connoisseur. He persuaded the late Mr. Coesvelt to look at a picture of high pretensions and of some merit in his house. Whilst they were discussing it, the jingle of posting bells was heard in the street, and the prolonged crack of a courier's whip echoed in the doorway. A. started, rushed out, and beheld an express, booted, spurred, and splashed, who handed him a letter. Tearing it open, he appeared struck with confusion, and exclaimed, "Well, here is a fine scrape I have got into." "What is the matter?" "Why I am talking about selling you this picture, and here is the courier sent back from Ancona to buy, it, by a Russian gentleman to whom I offered it last week, for such a sum." The price was a large one, and Mr. Coesvelt would not have thought of giving it for the picture, which did not interest him much; but so cleverly did A. contrive to transfer to it the interest of this dramatic scene, that, in the excitement of the moment, a bargain was struck; and our countryman went off delighted at the idea of having done the Russian—the latter being an imaginary personage, and his courier a Roman postboy, hired to gallop up in the nick of time!

The greatest risk of imposition, is that arising from counterfeited pictures. In several principal towns of Italy, there are regular workshops for the forgery of the masters who formerly painted

there. Thus, in Bologna, the imitations are chiefly of the Caracci and their followers, as well as of Carlo Dolce and Sassoferrata; at Venice of Titian and Giorgione. In Milan and Ferrara, the fabrications after the schools of Luini and Garofalo are especially successful, as well as those of Morone's beautiful portraits. Old and ruined panels are chosen, and either restored on the original design, or, if that has been obliterated, they are prepared and painted afresh. Sometimes the portions which have suffered least are allowed to remain, and new bits of varied composition are ingeniously dovetailed into the piece, which is then beplastered with varnish, the better to puzzle too curious observers. In all these cases, the treatment of some famed master is so exactly imitated as often to baffle detection, even where suspicion has been roused by the confused appearance of the work; and the dissimilarity of surface often escapes minute criticism out of respect to the worm-channels visible behind. The forgeries thus executed are issued by a class of Italian dealers, who, sometimes in the disguise of gentlemen, lend themselves to the imposition, and share its profits. Many of them are also sent abroad, probably to *bonâ fide* retailers. Against such productions, especially of the schools we have mentioned, it is impossible to be too guarded, as even the best judges are sometimes duped. Rules are utterly useless against a species of villany which only great practice can detect: it is, however, well to look with suspicion on all that class of pictures, when of high pretensions, and offered at comparatively low prices, especially if recently and very thickly varnished.

Few of the picture-forgers approach the talent of Guizzardardi of Bologna, who, to a competent knowledge of design, adds an extraordinary dexterity in imitating the surface of the old masters, from Francia to Guido. His weak point being composition, he prefers repainting destroyed old works of a good artist or school, to the production of original ones, and the triumph of skill is thus the greater, as the new surface is often brought into close contrast with the old crust.

In 1842, we were carried to see, at the house of a Roman count, a lot of pictures with which Guizzardardi had probably an intimate acquaintance. There were about a dozen of them, including two large Raffaelles, one Francesco, and two Giacomo Francias, a Leonardo, a Luini, a Bellini, a Correggio, a Claude, and a Ghirlandajo: some were palpable copies, one an unfinished work, (a frequent device of the forgers, which saves trouble and disarms criticism,) several evidently retouched, but perhaps not one which a thorough connoisseur, if not aware of the extent to which the art of counterfeiting can now be carried, would not have pronounced a production of the school to which it was attributed. These pictures were bolstered up by all the aids of mystery; they were stated to be the gems of a princely gallery which the head of an old family wished to convert into a more liberal provision for his younger children; but as, on the slightest suspicion of his design, their alienation would be interdicted at the instance of his heir, and their exportation arrested by the government, the most perfect secrecy was made a condition of being admitted to a sight of these master-pieces. So well baited was the hook that several *milors* had already nibbled, and one fine gudgeon, in the guise of a rich London porter-brewer, had escaped almost by a miracle. His offer of 1000*l.* was said

to have been refused for a "Madonna" by Francesco Francia, whose real years had assuredly not reached their teens: on second thoughts, the proprietor sent to resign the prize for that sum, but our countryman had meanwhile become shy, or had elsewhere satisfied his craving, and so declined the barbed seduction.

The Chevalier Michele Micheli of Florence claims to have discovered the vehicle used in distemper-painting previous to the adoption of an oil medium. He keeps the secret, but exercises it in producing small pictures on old panels, to which he gives the surface of antiquity by baking them in a powerful sun, or by artificial heat, and when thus cooked they have deceived many supposed connoisseurs. He usually prefers following the designs of old masters to bestowing his labor upon original compositions, but his works are close imitations rather than copies. He boasts that many Raffaelles from his easel have brought handsome prices at Philips' and Christie's; and we have seen in his studio and elsewhere, others not unworthy of that honor. He gave a friend of ours the finest specimen he had executed in this style, to show Sir Thomas Lawrence the perfection to which it might be carried, but he accompanied the sale with a condition that his name and seal should appear at the back, to secure him the credit of a work which might be ascribed to Ghirlandajo. It has since hung among choice bits by the Gaddi, Beato Angelico, and similar masters, and has not been questioned by more than two or three connoisseurs. In various towns of Italy his works are offered as those of Fra Bartolomeo, Pinturicchio, and Andrea del Sarto, and the veracity of the following little history is unquestioned.

M. Kerschhoff, a Russian amateur, was invited to accompany some Florentine gentlemen on a shooting party into the Maremma. Whilst they pursued their sport, he, disgusted by ill-success, returned to wait for them at a cottage where their horses were put up. Having got into conversation with its occupant, the latter inquired if his guest was fond of pictures, as he had something curious that might interest him. After a long story how his father had, on his death-bed, confided to him the secret, that a picture concealed in the house was of value sufficient to make the fortune of all his family, but that having been feloniously obtained, it would, if ever shown or sold in that neighborhood, certainly bring him into trouble—the rustic produced a very pleasing Madonna and Child in a very antique carved frame, which the Russian cordially admired, and being asked to guess the artist, named Raffaele. "That," said the peasant, "was, I do believe, the very one my father mentioned, but you can see if it was so, as he gave me this bit of paper with the name written in it." On the dirty shred there was in fact scrawled "Raffaello Sanzi;" and its possessor went on to hint that, being anxious to realize what he knew to be most valuable property, and seeing no great chance of then disposing of it safely, he would accept from him, as a foreigner, a price far below its value. The negotiation thus opened, ended in the Russian offering 35,000 francs, or 1,400*l.*, which after due hesitation was accepted. The prize was huddled into a clothes-bag, and its new master, without waiting to take leave of his friends, started for Florence, and thence hurried on to Rome, lest it should be stopped by the Tuscan government. There he boasted of his acquisition, and showed it to several connoisseurs, who

sang its praises until Signor Vallati, a skilful dealer whose name will be presently again mentioned, quickly recognized the real artist. It was in fact a beautiful repetition, with slight variations, of Raffaele's famous "Madonna del Gran-duca:" it was painted by Micheli, who avows that he sold it for 150 crowns; and the shooting-party was a conspiracy by several well-born swindlers to take in their Russian friend! The latter returned to Florence to seek redress by a prosecution, which was compromised by their returning most of the price. Being curious to see or obtain the subject of so strange a tale, we subsequently inquired for the picture, but were told it might probably be met with as an original, in some great German collection, having been there resold by the Russian, at a price almost equal to what he had himself originally paid!

If further proof be required of the danger of such counterfeits, it may be found in the doubts recently raised regarding the "Madonna della Seggiola" of Raffaele; a picture which, if the laudations of artists and travellers, and the daily repetition of copies be a test, is, perhaps, the most generally admired in Europe. It occurred to us to hear, with the utmost surprise, from two of the most skilful judges now in Italy, one a native, the other English, an opinion which they had formed separately, and without concert, that this much admired and beautiful work is a counterfeit, executed on the design of Raffaele, and probably not a century and a half old. And it is remarkable that the Italian critic having pronounced the like judgment in regard to a picture of similar composition, which had been purchased out of a princely gallery at Rome, as from the hand of Raffaele or his pupils, he was allowed to test its accuracy by the application of a solvent, which quickly effaced part of St. John's head, and discovered the eye of an older picture under his cheek-bone! Whatever be the truth of this mystery, two painful considerations naturally occur: if the Seggiola picture is forged, what production ascribed to Raffaele may not be the same? If it is genuine, what picture is safe from detraction?

How interesting would it be to have the adventures of a genuine Raffaele minutely recorded! The successive *pensieri* of the master during the progress of his work, as manifested in sketches, alterations, soliloquies, or conversations; the admiring comments of his friends, and his own replies and defences. Then his studio, the resort of all that was enlightened and accomplished in the golden days of Italian genius; its frequenters, the most choice spirits of the age; its pupils, an unrivalled constellation of artists; its models, personifications of manly beauty and of female loveliness; its sketches, its easel-talk, invaluable, had there but been Laurences and Boswells to collect and record them. Then to follow the completed work through the churches, palaces, galleries, cabinets it has since adorned; sometimes lost amidst scenes of war and pillage, begrimed with dirt, degraded, perhaps, to the pawn-broker's stall; again emerging from the restorer's hand, and subjected to the elaborate mendacity of a grasping dealer, or the loathsome bombast of a swaggering auctioneer, until, through such fearful ordeal, it reaches the repose of a drawing-room in the nineteenth century.

The temptations to trickery which picture-dealing offers are at least equalled in the sale of antiquities, which has long been an important trade

at Rome and Naples. "You are well aware, sir, that this business of ours cannot be carried on without lies, and that we must be always a-telling of them: in fact, a man must just pocket his baptism when he sells objects of antiquity; is it not so, sir?" Such are the principles of the antiquarian fraternity, as explained to us by the faithful shopman of one of its Roman members: their practice may be illustrated by what occurred to his master many years ago. An English nobleman, who was known to devote his wealth liberally to the acquisition of antiques, having arrived in the Eternal City, V. forthwith commissioned a cameo, which he made sure would please the earl, from one of the best fabricators of antique gems, a class of artists then of real talent, and not necessarily parties to the impositions they created, as their works were valuable even as copies. A fine stone having been selected, it was finished in the best style, and committed to a jeweller to be set as a ring. In his hands it was casually broken to bits: the plot was defeated, the dealer was furious, but the victim was *not* saved. The wily Italian fell upon a device to render the bait more than ever deadly. Having selected a principal morsel of the cameo, he carried it to the peer, as a fragment just brought in by a peasant, which, though incomplete, rivalled the rarest gems in perfection of material and of art. After dwelling upon it with that mellifluous eloquence which only an Italian can employ to good purpose—for in a language whose every syllable is euphony, even verbiage becomes effective—he obtained for it a sum which far more than repaid his outlay. Now as some collectors of such relics so treasure those which time or violence has broken, as almost to give them a seeming preference, the lord and the dealer had perhaps equal reason to be satisfied with the transaction. But there were more fragments behind, so after pocketing the price and bowing himself out, V. returned to say, that as it would be a pity the rest of so lovely a work should be lost, he had desired the peasant to dig again for the other bits, in which he might very probably be successful. Next day he returned with another morsel, which he celebrated by another string of superlative epithets, and sold by another tissue of falsehoods, for another ransom; and that in due time was succeeded by the remaining fragments, all separately produced, separately puffed, and separately paid for, until in the end the accidental fracture of the stone proved to have quadrupled its price.

Let us now contrast English honor with Italian honesty. A nobleman, whose position in the intellectual society of our country is even higher than his rank in the peerage, when riding near Tivoli was offered a Roman bronze medal by a peasant, and bought it for half-a-crown. Being no great virtuoso, he showed it to some connoisseur, who pronounced it a coin of great rarity, and fine preservation, worth at least thirty dollars. Next time the peer visited Tivoli, he sought out the peasant and presented him with that sum.

Few topics connected with pictures are more interesting than the occasional discovery of some long lost or forgotten gem of art, and the anecdotes told of such are often highly curious. Some of these we shall now mention. Among the choice-works added by the taste and liberality of Louis. of Bavaria to the Pinacotheca at Munich, is the half-length Madonna, straining to her lips and bosom the infant Christ, commonly known as the

Madonna del Tempi, from the Counts Tempi of Florence, in whose possession it was discovered. A servant of the family happening to require medical assistance, a physician was conducted to the garret in which he lay. In that land where a feeling for art is inherent in the national character, connoisseurship is the especial ambition of many disciples of Galen. While the sufferer detailed his symptoms, the doctor's eyes were fixed upon a begrimed panel that hung over the bed. After prescribing for the case, he sought the count, and begged leave to examine the picture. Having refreshed its dusty surface, he recommended that it should immediately be cleaned, as he had little doubt of its being a good work of the school of Raffaella. This having been done, the doctor's judgment was fully confirmed. The picture was attributed to Raffaella herself, though some judges have ascribed it to Andrea del Sarto, and it was sold to King Louis for about 1500*l*.

Nor is this an isolated case at Munich. The fairest gem of the Leuchtenburg Gallery is the Madonna and Child, by Murillo, or, as some say, by Vandyke, a work excelled by few that ever left the easel of either of these great colorists. It is said to have been picked up at a small ale-house, near Ratisbon, by a poor dealer, from whom it was acquired by Count Rechberg, and subsequently by Prince Eugene Beauharnois. So, too, the statue of Honous, one of the sons of Niobe, which is esteemed the *chef-d'œuvre* of the Glyptotheca, was found some years ago in the workshop of a mason at Dresden, to whom but five francs were paid for it, though the king was content subsequently to acquire it for 1500*l*.

In the celebrated cause of Vallati's Magdalen, to which we shall presently refer, evidence was adduced of this circumstance. A Madonna, Child, and St. John, originally in the Farnese family, which was inscribed on the back "a work of the divine Raffaella," and had been attested as genuine by a pope, came some years since, by inheritance, to a Contessa Broglio, of Turin, who desired her porter to sell it for 32*l*. Falling into the hands of one who recognized its merit, it was purchased from him by the Prince of Carignan, and now adorns the Royal Gallery, under the name of the Madonna della Tenda, from the curtain in the background. Another instance rests on the same authority. Among some trash rejected from the Florence Gallery, and sold some years ago by order of the Grand Duke, a picture was bought by one Fieschi, a restorer. On being cleaned, it was acknowledged to be a Leonardo, and 900*l*. was offered in vain to its fortunate purchaser. Again, Professor Tosoni, of Milan, has a beautiful little allegorical picture, which he considers by Raffaella, and values at four thousand louis-d'or, but for which he paid an English gentleman 42*l*.

There is in Italy a class of picture-jobbers, who wander on foot among the towns and villages, with a scanty purse, and still more slender knowledge of art, picking up for a few shillings such things as their very restricted funds place within their reach. These they carry to their booth or cellar in one of the capitals, whither resort the poorer classes, when conscience or piety suggests the addition of a Madonna, or a favorite saint, to the devotional garniture of their humble homes. There, too, may ever and anon be seen some lynx-eyed dealer, or some shrewd amateur, turning over piles of shattered panels, and disturbing the dust of canvass shreds, in eager search after speculative

bits. Among such hucksters, the resurrectionists of art, a certain Luzzi is well known at Rome. His shop is a lumber-house of the veriest daubs, and the street-entrance is flanked by lines of glaring martyrdoms and contorted Madonnas, fit to scare away saints and sinners. Yet from the interior have issued not a few dingy pictures, which, in the hands of able restorers, have cast off their chrysalis coatings, and emerged in their native purity and brilliancy.

About the time when the cholera broke out at Rome in 1837, Luzzi returned from a circuit among the mountains of Umbria, that cradle of Christian art, wherein were reared the great founders of the Roman school of painting. In the house of the Ceccarelli at Spoleto, he found a new wonder of the world, a picture attributed to Raffaella, and priced at a few crowns. Though the sum exceeded the usual limits of this worthy's investments, he was induced by some good genius to nibble at the bait, and eventually carried it off for twenty-four shillings and sixpence. Resolved to do all justice to his speculation, he gave it to a restorer, who, wishing simply to entitle himself to a certain fee for his labors, found this most readily effected by gaudily overpainting the draperies, distances, and sky, leaving alone the heads, hands, and foregrounds, for which a more delicate handling was even in his eyes desirable. This done, the newly-found Raffaella was announced to the trade; but whilst the few dealers who had not fled from the pestilence, gazed, and hesitated, and higgled, Luzzi began to suspect he had got something better than an every-day Raffaella. The longer they looked, the higher rose his demands; at length the Chevalier Hewson, agent of the Portuguese government at the papal court, carried off the prize from the doubters, for about 76*l*. and a few indifferent pictures. The over daubing having been removed, and the surface carefully cleaned, the picture appeared in its original beauty, and in a rare purity of preservation. It is one of this artist's few productions from the Old Testament, and represents three youths restored to life by the prophet's mantle. Although hitherto unknown, its genuineness seems to have escaped question, and it is estimated by the chevalier at 4000*l*.

Only last summer Luzzi made another fortunate hit. Among some pictures which he bought from the march of Ancona, was a *Pieta*, with figures of life-size, wherein the Madonna wept over the lifeless body of the crucified Saviour, which she supported in her lap, whilst two cherubs joined in her lamentations. The torso was so much more masterly than the draperies, and the beard and other accessories had so suspicious a texture, as to occasion a doubt whether the picture was in a pure state. A skilful cleaner soon solved the riddle, by removing the dark blue mantle of woe which shrouded the virgin's head, when there emerged a Venus radiant in plaintive beauty, bewailing the premature fate of her beloved Adonis, whose exquisitely modelled limbs had been transformed into a frame rigid with long agony. It was a still simpler process to restore the mourning cherubs into tearful cupids, and to baptize as an Annibale Caracci a really good picture which had probably cost a few dollars, but for which five hundred louis-d'or are now demanded.

There is one other case which requires a more special notice, from the universal interest it has lately excited in Rome, as well as from its very extraordinary circumstances, and the view it affords

of Roman justice. In 1793, a quantity of pictures, sculptures, and other movables from the palace of Duke Flavio Orsini, were judicially deposited in charge of Duke Aloysio Lante, to abide the claims of the Orsini creditors. After much tedious litigation, Prince Odescalchi succeeded, in 1826, in establishing his claims upon this property, as creditor of the representatives of Duke Flavio, to the amount of some 6000*l.*, and thereupon obtained a warrant of sale. A judicial valuation was then made of the effects by Philip Agricola, now at the head of the Roman school of painting, and a Magdalen in the Desert, about eighteen inches by sixteen, was therein stated as a copy done in the school of the Caracci, from the original in the Dresden gallery, and was set down at thirty scudi, or 6*l.* 6*s.* The auction took place in February and April, 1837, and realized nearly 500*l.*, which sum, with the property remaining unsold, was adjudged to Prince Odescalchi, under the valuation wherein the Magdalen had been esteemed at thirty scudi. About two years later the prince offered these things to a picture-dealer, who declined the purchase, and they remained neglected until 1835, when, in consequence of part of the palace being let, several attempts were made by Zarlatta, the house steward, to get these, and other pictures which were in the way, disposed of among the trade in Rome. One of the persons called in to look at them was the Chevalier Vallati, a distinguished painter of boar-hunts, who at that time speculated in old pictures along with Mr. Jones, an English banker settled there, and who was brought by a *sensale* or low agent employed by the steward. After an ineffectual attempt to come to terms for a lot of considerable value, Vallati took up the Magdalen, and observing that it was one of the numerous copies after Correggio, said that he would give ten dollars for it. Zarlatta had shortly before shown it to another Roman dealer, who called it a bad copy of the Dresden picture, faulty in the head and arm, and thought it would be well sold for fifteen dollars. On reporting Vallati's offer to the prince, the latter said it should be accepted, as the pictures in that lot were of small moment. Accordingly, it was next day sold to Vallati for fifteen dollars, or 3*l.* 6*s.*, and a receipt given which stated it to be a copy from Correggio.

The picture was executed in oil, upon copper, but is described as then entirely overpainted. The original composition and outline had been generally followed, but the flesh-tints were glazed over, and other parts so thickly daubed, that the paint adhered to a glass which covered the surface, and beneath which dirt and dust were thickly clotted. Whether these liberties had been used with the idea of improving or disguising its merits, it is agreed that they gave the picture the air of a coarsely copy. Still, when Vallati began to examine it, after it had lain for about four months in his studio forgotten, he perceived a certain fineness of handling in minute portions of it, which argued better things, and with some difficulty he persuaded Cocchetti, the most skillful restorer in Rome, to put it in order. The latter at first paid little attention to the task, which he carried on at Vallati's; but, finding a better surface under the coarse paint, he was induced to persevere, and, in about nine months of occasional work, he accomplished it with perfect success. The usual solvents and processes being quite ineffectual to remove the overpaint, in consequence of its having

been laid on with oil, and not with varnish or distemper, he had recourse to pumice-stone, and even to sharp razors, with which he very gradually, and with the utmost caution, rasped and scraped away the extraneous coating, till the picture remained in its purity. This operation cost 150 dollars, and its result was a great triumph of skill and perseverance.

Delighted with his treasure, Vallati allowed his joy to exceed his discretion. The circumstances, at first confided as a secret to few, became, ere November, 1836, was over, the subject of discussion among the *dilettanti*, and the Magdalen was talked of as a long-lost original by Correggio, worth from 4000*l.* to 6000*l.* Prince Odescalchi, ere long, resolved to interfere; relying upon an edict by the Cardinal Camerlengo, (the official guardian of antiquities and art,) for the purpose of checking the removal of objects of value from Rome, he presented a complaint, stating what had occurred; and, on the allegation that it was about to be sold to a foreigner, prayed that an embargo might be laid upon the picture. Accordingly, Vallati was ordered to produce it, on pain of imprisonment, and the cardinal remitted it for the judgment of the Academy of St. Luke. In March, the committee of painters there, including eight of the leading Italian and German artists at Rome, unanimously recognized the great value and beauty of the work; but on the question of its authorship they were divided, two considering it by Correggio, four thinking it was not, and two being doubtful. The cardinal, upon this, obliged Vallati to come under heavy recognizances for production of the picture when required, which, meanwhile, was restored to his possession.

Having thus secured its retention within the jurisdiction of the Roman courts, the prince raised a civil action for nullifying the sale, on the ground of error, false consideration, and enormous injury, alleging that his agents had sold for a trifle, under the impression that it was a worthless copy, a fine original by Correggio or some other great master. In December, 1838, judgment was pronounced against Vallati, rescinding the contract, and ordaining him to restore the picture, on receiving from Odescalchi the original price, and the sum spent in cleaning it. This sentence proceeded on the want of legal consent to the vendor, in consequence of error, and inferred that Vallati might have previously discovered the value of the work, so as not to be in good faith when purchasing it at the price of a bad copy. Against this decision Vallati appealed; and after a bitter litigation, protracted till 1842, a compromise was made. The picture was to be sold, and the price divided between the parties, each paying his own costs. Vallati states his expenses at nearly 800*l.*, and estimates his adversary's somewhat higher. Mr. Jones had previously paid a sum to Vallati, to be free of all share in the transaction, being obliged to return to England in bad health, where he soon after died.

We give these details of the great Vallati cause, as they have formed a leading topic in the Roman circles during several winters, and as they illustrate some curious phases of Italian picture-dealing. A rich English nobleman was last year on terms for the Magdalen, when a party, from alleged interested motives, conveyed to him the reported dictum of Mr. Woodburn, that it was an old copy worth 500*l.* Signor Vallati, however, offers to prove that Mr. Woodburn never saw the

picture at all, but only a copy recently made from it, imitating its time-worn texture, which hung outside of the sanctum wherein it lay. Thus the chevalier has been doubly unlucky in the results of his fortunate speculation. He was deprived of his purchase by the Roman courts, because the best judges in Italy pronounced it an original of the highest value. He has lost his purchaser, because an English picture-dealer, blundering between his gem and a modern imitation of it, declared it a copy. Verily may the tribe of dealers call their trade "a hazard;" and the Italian prince may compare notes with the English peer, which of them is the greater gull.

Signor Vallati has, however, had his triumph, in another incident illustrative of the chances of picture-selling. Having acquired a singular and very beautiful landscape, in which a bit of savage Swiss scenery was treated with much originality, he baptized it a Rembrandt, although this opinion was demurred to by some persons acquainted with the usual specimens of that master. Mr. Woodburn at once pronounced it no Rembrandt, but declined naming the author, and the picture consequently remained on hand with a blighted reputation. An English gentleman, whose interest and curiosity in the work had been greatly roused, while closely examining it one day with a powerful magnifier, thought he could distinguish on the grassy foreground some lines of colder tint, resembling a cypher. In the enthusiasm of the moment, he bought the landscape for £300, and then begged Vallati to apply the usual test, in order to see if any repainting could be detected there. On being strongly rubbed with spirits, a portion of the foreground came away, and the monogram of Rembrandt, which some ignorant restorer had covered, in patching an adjoining hole, became legible, but resisted all further trial to remove it. The gentleman was equally delighted with his casual discovery and his purchase; and although Vallati, had he been aware of this proof of its authenticity, might have set a higher value upon the prize, yet he had the satisfaction of finding his deliberate judgment confirmed, at the expense of Mr. Woodburn's infallibility.

The circumstances narrated in the Vallati suit may put purchasers of works of art within the Papal states on their guard against a double risk; first, that of having their acquisitions stopped by government, in case they be deemed of sufficient importance; and, secondly, the nullification of the sale at the instance of the seller, should the price turn out to have been inadequate. The former of these hazards exists also in Tuscany and Naples, and all old pictures and sculpture for exportation ought to be examined by an officer appointed to this duty, without whose clearance they are liable to be stopped at the custom-house. Nor is this law by any means a dead letter, although very rarely applied. It is generally understood that all the personal influence at the papal court of King Louis of Bavaria, the most catholic of reigning sovereigns, was required to sanction his removing the celebrated drunken fawn, which he had purchased from the Barberini family—one of the most choice though hideous statues of antiquity, and now a principal ornament of the Glyptotheca at Munich. At this moment a bronze bust of Bindo Altoviti, by Benvenuto Cellini, is embargoed in the deserted palace of that family at Rome, in consequence of the Camerlengo's refusal to let its owner remove it to his residence in Florence.

The latter has shut it closely up, either from pet, or in the hope of smuggling it out unobserved, to prevent which spies are incessantly on the watch. It seems a monstrous hardship, that a man shall not be able to remove a family portrait from his deserted habitation to his actual residence, and still more when the real motive is to compel him to part with it to a foreign government on their own terms. A well known and recent instance was that of Count Marscalchi's Correggio, which had actually been sold at Bologna, and, as we believe, delivered to a French gentleman, but which the count was compelled to get back, and surrender to the Vatican for a smaller sum. Duke Braschi last year resigned to the government without a struggle his famous Antinous for about 1850. though no doubt more might have been obtained abroad, had the secret abduction of so colossal a statue been practicable. The removal of the Fesch pictures goes on unquestioned, under a special permission obtained by the cardinal ere he removed them from Paris; it remains to be seen whether some of those acquired by him subsequently may not be stopped. A friend of our own met with a persecution at Rome in 1839, very similar to that endured by Vallati, in regard to a missal of unique beauty, with signed *miniatures* by Perugino, Francia, and their best pupils, which he had openly purchased a year before from Prince Albani, and, but for his prudence in sending it to England on the first alarm, he would unquestionably have been robbed of his prize. It may be well to add, that all objects of old art enter the Roman states duty free, but are liable to an *ad-valorem* duty of twenty per cent. on exportation, whilst modern productions pay only on entering. In Tuscany, the rule is reversed, a duty being exigible on the import of old objects, but none on their export. At Naples, the export duty on pictures is a dollar for each square palm of ten inches. The sale of pictures from churches is permitted by the government of Tuscany, but much discountenanced by that of Rome.

Picture-dealing has its drones, who fatten upon its profits without contributing the knowledge, labor, or capital which produce them. They are embodied in the form of couriers and *laquais de place*, two fraternities who assume the privilege of exacting unjust gains upon every transaction into which they can thrust their officious services, but especially upon their masters' dilettanti purchases. The usual rate is from five to ten per cent. upon the price, but it is sometimes screwed up to five-and-twenty. A few years ago there was a very beautiful and perfect female suit of armor exposed for sale, in a curiosity shop at Geneva, for 80*l.*; one evening an English gentleman strolled in with his courier, admired it greatly, made no objection to the price, and said he would call and make the bargain next morning. Soon after, the courier returned and demanded 20*l.* as his fee on the sale. The shopman said he would willingly allow him the usual amount, but could do no more in his master's absence. The servant replied, he would take care that his master did not come again to the shop, and he kept his word. This discount comes of course indirectly out of the purchaser's pocket, and it is very common to be asked, when bargaining at shops of that sort, whether you have a *valet de place* in attendance, that the price may be adjusted accordingly. Half-a-dozen years since, the valets at Bologna combined to raise their fee to ten per cent., threaten-

ing to prevent strangers from visiting any sale gallery where these terms were not acceded to, upon which some of the dealers, to defeat the plot, forwarded their address cards to the frontier, and bribed the police agents to fold them up in the passports of travellers.

Among the evidence offered in the suit of Prince Odescalchi against Vallati, to which we have more than once referred, there was this formal exposition of the principles and results of picture-dealing, sworn to by eighteen leading members of the trade then in Rome:

"In the sale and purchase of pictures, all depends upon the actual result and chance of gain common to both parties. For pictures which are bought in the hope of discovering something better than appears, and of reproducing them in their original state, often turn out even worse than they seemed, thus occasioning manifest loss. And were it not that in rare instances and after much outlay, risk, and trouble, a fortunate hit compensates for many previous sacrifices, this trade would be at an end; for without such a hope no one would be disposed to make acquisitions that were always to turn out ill. Another danger to which those who carry on this sort of business are exposed, arises from the difficulty of finding an able restorer, so that even when they have the luck to meet with anything good, it is generally injured in being cleaned. Besides all this, there must be taken into consideration the large sums tied up in those pictures which remain on hand for years, as well as the great labor and application necessary for obtaining a thorough acquaintance with this most difficult subject. In all these transactions, advantages, and risks, the private party selling has no part, for the result, as regards profit and loss, is limited to the speculative buyer exclusively."

With this manifesto we might conclude our notices of picture-dealing, but that a new phasis which the trade has recently assumed in the Eternal City remains to be mentioned. Basseggio and Baldeschi, two dealers, who stand favorably conspicuous among their fellows for enterprise, connoisseurship, and good faith, have been making frequent journeys to London and Paris, for the acquisition of works of art; and, we have little hesitation in believing, that the pictures brought to Rome by the former from London, in the last three years, exceed in merit all that have been sent from thence to England during the same time. Regular in his attendance on auctions, vigilant among the rubbish of Wardour-street, he has secured many prizes for sums which enable him to offer them in his own country at unusually moderate rates. Nor are his purchases confined to the purlieu of picture traffic. In 1842, the Litchfield Claude passed into his hands, and last year he carried off a very rare specimen of Rodolfo Ghirlandajo, one of the greatest Florentine painters, which is not unlikely to enrich the Vatican gallery of *chefs-d'œuvre*. The chances of such works returning to our shores are at present small, for fox-hunting has greatly superseded picture-buying at Rome, as far as our wealthy countrymen are concerned. Artists and dealers suffer equally from this caprice of fashion; but both still look to the English as their surest and most liberal customers. It is not long since we heard a worthy Dutch landscape-painter narrate in broken English the following incident:

"I work in my studio one day ven one gentleman wid de *lunettes* come in, make one, two, tree how,

very profound, and say, '*Gut morgen, Meinheer!*' I make one, two, tree profound bow, and say de same. Den de gentleman look at all my picture very slow and deliberate: den he say, '*Dat is goot; dat is beautiful; dat is vondrous fine.*' Den he say at last, '*Sare, will you permit me to bring my friend de Baron von A. to see your fine vork?*' I say, '*Sare, you vill do me one favor.*' Den he make tree more bow more profound dan before, and he go vay. De next day he bring his friend de baron, and dey two make six bow all very profound, and dey say dat all is very beautiful, and den de baron say, '*Sare, vill you let me bring my friend de Count von B. to see dese so fine vork?*' and den dey make der bow once again and go vay, and I see dem no more. Dat vas one German gentleman.

"Another day, one little gentleman come in wid one skip and say, '*Bon jour, Monsieur! charmé de faire votre connaissance.*' He take up his *lorgnette*, and he look at my first picture, and he say, '*Ah, very vell, sare! dat is one very fine morsel.*' Den he pass quick to anoder and he say, '*Sare, dis is truly admirable; after dis beautiful nature is vort notting:*' and so in two minute and half he get trough dem all. Den he twirl his cane, and stick out his chin, and say, '*Sare, I make you my compliment; you have one great talent for de landscape; I shall have de honor to recommend you to all my friend; au revoir, Monsieur;*' but I see him never again. He vas one French Gentleman.

"Another day, I hear one loud tap wid one stick at my door, and ven I say, '*Come in,*' one gentleman walk forwards, very stiff and nod his head, but take never his hat off. He say, '*May I see your picture?*' I bow, and say, '*Wid pleasure, sare.*' He no answer, but look at one long time, and say not a vord. Den he look at anoder and say notting. Den he go to anoder and look, and say, '*Vat is de price of dis?*' I say, '*Forty louis, sare.*' He say notting, but go to de next, and look one long time; and at last he say, '*Vat is de price of dis?*' Den I say, '*Sare, it is sixty louis.*' Den he say notting but look another long time. Den he say, '*Can you give me pen and ink?*' and ven I give it he sit down and he say, '*Vat is your name, sare?*' Den I give him my card, and he write one order on Torlonia for sixty louis: he give me de order wid his card, and he say, '*Dat picture is mine; dat is my address; send it home: goud morning.*' And so he make one more stiff nod and walk away. This vas one English gentleman."

There is one view in which picture-dealing becomes matter of public interest among ourselves, as regards the formation of our National Gallery. It has been alleged, in several instances, that the additions made to it seem to be tested chiefly by the amount of their cost. Now, it appears to us, that it is not with the trustees that the fault lies, of a system which has given us the smallest, and dearest if the most select gallery in Europe. The purchase of the Angerstein pictures, however languidly planned by the ministry, was nobly carried through by parliament. The opportunities lost by their predecessors during the convulsions of the war were unlikely to recur. One individual had taken advantage of them in the finest spirit, and had secured, perhaps, the only private collection worthy of being the nucleus for a national one. Such circumstances precluded the carping of candle-parers, and, if the price had been double, it

was well-earned, and wisely given. But what were the next steps in this new and praiseworthy direction? The appointment of trustees or commissioners to make further acquisitions was probably incumbent, as the cost was to be borne by the community. But where else did it ever enter into the arrangements of a cabinet to submit to the critical fiat of 649 legislators the price of a Durer, the originality of a Guido, or the purity of a Perugino? Few Britons are, perhaps, aware of the preposterous fact, that each purchase made for the Trafalgar-square rooms is a subject of a parliamentary estimate, and is liable to an *ex-post-facto* discussion in the House of Commons, when the expediency and worth of the investment, and the judgment of the trustees, are at times rudely and unjustly assailed by men totally incapable of forming an idea on these matters. But there is a standard of pictorial merit comprehensible even by utilitarian critics—the price paid. It has originated in what is at least a novel idea, that all high-priced works must be fine ones; and, in that conviction, even our economists become generous, lest they should be humbugged. Whilst saving prevails in the other estimates, and cheap production is the object for which machines are made to whirl, and workmen to languish, the old sneer of “cheap and nasty” remains a term of reproach only in the fine arts. Providea pictures are but dear, they are sure to be respected in a committee of supply; and if extracted from a celebrated collection, they are presumed to be exempt from criticism. Conforming to these circumstances, the trustees buy only works of established celebrity, and, consequently, of extravagant price. Now, did the money thus superfluously charged against the nation go into the pockets of our first artists, the blunder would have our sympathy, but against its enriching speculators we do most seriously protest.

Yet a few words as to the principle of selection which has in general been adopted by the trustees. But whilst we attempt to show the fallacious course they have sometimes pursued, we are far from imputing any deficiency of zeal, still less any impurity of intention, to the eminent gentlemen who gratuitously discharge to their country a most onerous and obnoxious duty. If the main objects to be attained from a national gallery of high art be the instruction of its visitors, and the guidance of the public taste, it follows, that excellence is not the sole consideration to be kept in view while forming it. Thus, the Madonna is the leading theme among the greatest painters in the best age of art, and the Roman stands foremost among the schools of its golden days. Yet what should we say of a national gallery composed altogether of Madonnas, or consisting exclusively of Raffaele and his pupils? Do we not, on the contrary, expect to find there specimens of whatever is worth knowing, as well as of what is deemed fit to occupy a student's pencil. Great libraries are not formed solely for the preservation of fine paper copies of standard and popular authors, and why should it be so with galleries? The great foreign schools of painting have belonged to Italy, the Netherlands, Germany, Spain, and France. Of these, the first is unquestionably preëminent, and next in importance may be ranked that of Holland and the Low Countries, as unrivalled in *genre* painting. Germany, among us who have borrowed so much from Holbein and Rubens, is entitled to the third place, and Spain

and France must conclude the list. Again, the Italian schools are at least twelve in number, each with its own type, more or less distinctly developed. Thus we have about twenty different manners, or classes of painting, to look for in a great public gallery. Now, without attempting to analyze the contents of the Trafalgar-square rooms under this view, it is enough to say, that the schools of Sienna, Genoa, Sicily, and upper and lower Germany, are totally excluded; those of Florence, Naples, Milan, Umbria, and Spain, virtually so. These are startling deficiencies in a national collection, even though it numbers but few lustres. But a greater discouragement awaits the student of art, in the total absence of any pictorial work (except by Van Eyk) executed prior to 1500, that being close upon the time when high art is admitted to have attained its culminating point, and when, according to some critics, it was already on the wane. Now, whether these be just opinions or not, is just what a national gallery ought to enable us to decide by well selected specimens, and we trust, that instead of adding to our already rich store of Bolognese and French works, the trustees will take measures to procure some fine productions of the mediæval masters. The moment is favorable, but it is quickly passing. Had they come into the market a few years ago, with the sovereigns of Prussia and Bavaria, they would have found the supply ample and the prices mean. Now this taste has become a fashion, and must be gratified at fashionable cost. Every day the comparatively few pieces in high preservation are picked up by foreign governments, or are undergoing from speculators barbarous retouches in oil, and daubings of varnish, which all but disqualify them for the illustration of art. Yet even now there may be found in some secluded mountain church or remote convent, grand altar-pieces in distemper which preserve the type of the Giottists, or upon which the highest Christian masters of Umbria or Sienna have traced an almost inspired purity of feeling. It is true, that the prices which would extract these from their simple possessors are numbered but in dollars; this, however, need be no fatal objection, as the interested intermediation of the wonted agents might transmute the sum into any amount of sovereigns deemed sufficient to stamp the merit of the pictures.

The improvements desirable upon the present mode of acquiring pictures for the Gallery are, we venture to think, two-fold. Instead of subjecting each purchase to a special vote and discussion in parliament, a fixed annual sum should be placed at the disposal of a competent body of trustees for investment in pictures as occasion may offer, under an obligation to publish yearly the amount actually so expended, with the particular inducements or grounds on which each choice was made. The benefit to the trustees of such a plan is obvious, from its leaving their hands unfettered, and their judgment uncontrolled: the public would at the same time have the advantage of comprehending their views, and of watching, with increased interest and intelligence, the progress of the collection: and as it would be no longer necessary to tell the price in order to have a negotiation ratified, these gentlemen would dare to buy where, when, and for as little money as they could; and though they might continue to bribe Beckfords and Londonderrys out of their choicest gems, they would compensate such exceptional extravagance by many snug little bargains for which they could

not now ask a particular vote. In order to effect such bargains, our second innovation would be required. There is at present a rule or understanding, that the trustees buy nothing that is not sent or their inspection in London, and a most convenient defence it must be against jobbing and imposition. But they ought to, and sooner or later must, get many things which will never be brought on chance to the great Babel, nor dangle attendance there. If the continental sovereigns had acted thus, would the Houghton and Coesvelt Galleries be now in St. Petersburg; or would those truly splendid ones of Munich and Berlin have started into full manhood, during the years when ours has attained a very stunted adolescence? Each of these monarchs, as well as Louis Philippe, has agents in every part of Italy, to report the discovery or occurrence of anything interesting in antique or medieval art, and thus many objects are secured by them which never were, and perhaps never would have been, thrown into the open market. To do this, without being imposed upon by ignorant zeal or interested meanness, must require considerable management; but as it seems to answer in these cases, and in the transactions for the British Museum, it is difficult to see why it should fail, if judiciously introduced in supplement of the present system, which has hitherto neither produced abundant fruits, nor proved an efficient protection against the high profits of speculators.

A few words, ere we close this discursive article, as to English students of art in Italy. It is the misfortune of most of them to go out unprepared by proper education for the career which they have perhaps rashly chosen. They are generally even ignorant of the important truth, that in no profession is extensive and varied knowledge more necessary to eminent success. History, in all its branches; biography, rich in dramatic touches; poetry, with its imaginative stores; physiology, not less of the mind and passions, than of the limbs and muscles;—these are but a few of the studies which ought to relieve the more technical labors of the painter and sculptor. In the olden time, it was usual for the same men to excel in architecture, engineering, and geometry, in painting, sculpture, and silver-chasing; indeed, not a few of the foremost artists gave a portion of their time to politics and diplomacy. But these days are gone by, and it now too frequently happens that men, who have raised themselves by artistic talent above the sphere of their birth, are unfitted by education for the social position to which they have attained. But the deficiency most immediately baffling to a student is his ignorance of modern languages, and of the history of art. Indeed, no literature of a refined people is so wanting as our own in artistic works, original or translated. The English version of Lanzi is insufficient to infuse a taste and knowledge of Italian painting into an entire people, and Kugler's Handbook, in itself over-appreciated, is useful to those only who are already versant in the subject. Our students have thus few materials for private study, besides the discourses of Sir Joshua, and the Essays of Fuseli, Hazlitt, and Haydon, and having mastered these, each fancies himself well read in his future profession. Accustomed at home to spend all his working hours over his portfolio or his pallet, he has never contemplated familiarizing himself with modern tongues, so as to render them a relaxation. He finds himself in

Paris or Rome scarcely able to ask his way, and without a means of acquiring information from the people, or the books around him. The dissipation of mind, and perhaps of habits, induced by the endless novelties and temptations of his new situation, prevents his applying to the irksome task of grammar, and, after a year or two's absence, he returns almost as unlettered as he went.

His professional studies thereby suffer immensely. In the galleries of Milan, Bologna, and Florence, he finds himself before pictures which he has by chance been told are fine; but whose authors he never before heard named, and as to whose era or school he never dreams of troubling himself. Thus, wandering on from wall to wall, his eyes get dazzled, his ideas become a chaos, and he learns little more from these glorious works than a Chinese would do; or, if his organ of wonder chance to be strongly developed, he gazes on each new picture with an undistinguishing enthusiasm, which effaces the impression made by all the preceding ones. With wearied nerves and disappointed hopes, he turns to the churches most famed for mural paintings of the fifteenth century. There he becomes entirely non-plussed, for he can scarcely form a conjecture as to the themes before him, wherein he discerns only a crowd of figures inartificially grouped, a cluster of heads surrounded by golden sconces, and a pervading flatness deficient in coloring and chiaroscuro. Thus enclosed in a labyrinth without a clue, he falls back upon the only principles of faith he ever imbibed; namely, that color and effect constitute a picture, and that, next to Reynolds or Lawrence, the best painter is Paul Veronese. He recalls the gaudy walls of the Royal Academy, decides that Englishmen have nothing to learn from other nations, and either packs his portmanteau to go off on the morrow, or, if he sets up his easel, it is in the fond hope of finding a countryman to commit to canvass, with true English effect, or a subject in *genre* or landscape likely to sell in some provincial exhibition, and replace part of the money his fruitless journey has cost him. He heeds not the grand works of the old masters among which he lives, and returns to his native land as ignorant and more conceited than when he left it. Should he in after life become alive to the fact, that former times sent forth giants, before whose genius the pigmies of our day dwindle into their just proportions, he will lament deeply the lost opportunities of his student days. As yet, however, such repentance has been rare, for it would be profitless among a people who value little that leads not directly to gain; and until the contemplated decorations of our palace of parliament began to shed a *golden* light upon historic art, we doubt if ten royal academicians had studied Masaccio and Perugino, or had heard of Pinturicchio and Ghirlandajo.

Our description of the doings of English artists on their arrival in Italy is noways exaggerated; and some of them continue faithful to the like observances during a prolonged residence. We remember the *début* of one at Florence some years ago. No sooner settled than he hurried to the gallery, and passing rapidly by or through the tribune, reached the portrait-room of painters. There, in an obscure corner, he at length found something to admire. Not the Fresco of Masaccio, that personification of power without the appearance of study; not the head of Raffaele, embodying the sentiment

of pure beauty ; but the snub features of Harlow, depicted by their owner's slovenly brush. The imitation of Sir Joshua, if not happy was palpable ; our friend at once measured the canvass, and in two days was copying what he doubtless regarded as the gem of the gallery, quite forgetting that he might have studied Harlow without journeying to Florence. Such was the outset in Italy of one whose annual productions have now no want of puffers or purchasers in England.

Of such a student as we have supposed, Rome, however, is probably the head-quarters, and there he discovers attractions amid which his first disappointment evaporates. He is frankly received into the circle of his professional countrymen, among fifty or sixty of whom he quickly falls in with kindred spirits. He finds the more exemplary of them wedded to two ideas :—the necessity of securing the most celebrated models months in advance, and the propriety of a regular attendance at the British Life Academy. He follows the fashion in both respects, and should the latter task sometimes seem irksome, the three hours which it demands are preceded by a jovial *trattoria* dinner, interrupted by a lounge in the smoking-room, and followed by cigars and gossip at the *café*. In truth the whole student life of these men is what is termed in the Italian idiom, "too material"—too much time and thought are given to self, too little bestowed on art. Instead of striving to comprehend the feeling, or imitate the execution of a Raffaele or a Rubens, they ape the picturesque costume of these painters. Many of them seem to limit their rivalry of the old masters to the cut of their beavers, or the hirsute horrors of their beards, and study rather to caricature their own personal appearance, than to perfect the figures upon their canvasses. But there is yet a hope of better things. The cry raised from their native shores for a higher pictorial style has been responded to, and within a few weeks the students at Rome, in the face of a factious opposition, organized by a few more self-sufficient and bigoted seniors, have voluntarily placed their academy under the instructions of Professor Minardi, an artist whose modesty and good feeling are as remarkable as his fine taste and purity of design. Should he meet with fair play from the minority who opposed his appointment, much benefit may be looked for from his ministrations ; but if he be thwarted by such unfair and ungentleman-like opposition as is threatened by the dissentients, it will behove the friends of the academy to withdraw from it their countenance, until some higher authority end these disgraceful squabbles, by putting the establishment upon a footing which shall at once secure its discipline, and promote its utility.

How entirely different from these Anglican habits is the life of German artists in the Eternal City ! Prepared by reading the rich artistic stores of their own literature, and its abundant translations, most of them have been selected by their respective governments as likely to do credit to the small pension allowed them. It is barely adequate to their wants, affording them no facilities for dissipation ; but it renders them independent of interruption from private commissions, and it is continued for such a term of years as enables them thoroughly to master the language, as well as the pictorial history of the Peninsula. Under this system, the Germans are plodding students,

bound to each other, and to their common pursuit, by every tie of country and sympathy ; whilst the English are loiterers, left to waste or misapply their opportunities. Under it, Overbeck and Cornelius, Veit and Schnorr, Schwanthaler, and Gruner, have effected an entire renovation of art, and have enshrined their names in a niche far higher than their British contemporaries have, as yet, approached.

But as this is not the place for discussing the relative merit of modern German and British art, we shall conclude with a single remark. There is surely less egotism in trying to comprehend the deep feeling of the early masters, than in sneering at "Perugino and the pasteboard school," more good sense in attempting to renovate the styles of Raffaele and Ghirlandajo, than in talking about Michael Angelo, without daring to study him ; or in imitating Veronese, without equalling Tiepolo. No man in his senses charges Laurence with servility to Sir Joshua, or Landseer with plagiarism from Schnyders ; yet their approximation to these prototypes is surely not less decided than are the cartoons of Overbeck to those of Raffaele. Man is proverbially an imitative creature, and if we are to follow the path which another has explored, why judge most harshly of such as aspire to tread in the footsteps of one whom all ages honor, and whom all but our countrymen appreciate !

Chromatics ; or the Analogy, Harmony, and Philosophy of Colors. By GEORGE FIELD, Author of "Chromatography ; or a Treatise on Colors and Pigments, and of their Powers in Painting," &c. A new edition, augmented.

MR. FIELD'S theory of the analogy between harmonies of colors and of sounds has been eight-and-twenty years before the world, during which time the properties and phenomena of light and colors have been investigated by several men of science ; yet, we believe, the soundness of his theory and the correctness of his chromatic scale of hues have never been successfully impugned : on the contrary, scientific research has tended to confirm the validity of both. Mr. Field's authority on this subject, therefore, may be considered as fairly established.

This new edition has been much enlarged, and otherwise improved ; and many new illustrations and experiments have been added. The "Metochrone" described in this work is an ingenious and useful contrivance for accurately determining the actual and relative values of separate tints of color and combinations of them.

The author's fondness for long words and Latinized terms is a fault of style, which is happily gone out of fashion since Mr. Field's earlier days. —*Spectator*.

QUICK PASSAGE.—MR. Gladstone left the Ministry some time back, taking with him a small bundle of principles sooner than part with one of them, and started immediately for the opposition. In less than twenty-one days MR. GLADSTONE returned, meeting his old friends at the very same point at which he had left them ; but the honorable gentleman was compelled on the journey to throw away his principles in order to hasten his return. This is the quickest passage that has been effected within the recollection of the oldest member.

From Chambers' Journal.

BOOKSELLING IN GREAT BRITAIN.

[CONCLUDING NOTICE.]

THE glimpses—slight as they are—which our former articles have afforded of the early English trade in books, allows us to resume the subject at a period when bookselling took a firm commercial stand; which it did about the beginning of the last century. This has been called the Augustan age of literature, when Dryden, Steel, Addison, Swift, Pope, with a lesser host of geniuses, flourished.

At that period the mode of selling books was widely different to that which now prevails. Readers were fewer, and the means of making known the merits of a book far more limited. The only prospect an author had of profitable remuneration for his labors was to issue his book by subscription. To obtain a sufficiently large number of subscribers, it was necessary that he should secure the patronage of some man of rank and influence; if possible, a nobleman whose opinion on literary matters was held in respect, or whose more solid influence over dependents or friends gave to his expressed wish that they should subscribe, the nature of a command. The patron who took a genius by the hand in this way made it his business to praise him in every society—at court, at balls, masquerades, parties, and in the numerous London coffee-houses where the wits of the day were wont to assemble. To assist him in this sort of canvass, his protégé provided him with a sort of prospectus of the forthcoming work, in which was set forth its scope and nature. These "proposals" he industriously distributed along with his verbal puffs of the author's talents. When, by these means, a sufficient number of subscribers was obtained to render it a safe speculation to incur the expense of printing, the obliged author was expected to make some return to the patron for his exertions. This always consisted of a panegyric "dedication" conspicuously placed at the commencement of the volume. Some of these fulsome and extravagant lucubrations are sufficient evidence of the debasing influence which this system of publication must have exercised over literature. In most of them, truth was glaringly sacrificed, and notorious falsehoods promulgated, by motives manifestly interested. The nobility were the real though indirect publishers; and without their aid, to print even a good book would have been a certain loss; whilst hundreds of bad ones were fustied by this system on the world.

The author seldom went to the printer direct, but applied to the bookseller, (of whom many eminent ones were in business at the time we refer to,) taking with him his manuscript and his subscription list. In the eyes of the publisher, the merits or demerits of the book were of less consequence than the number of subscribers. He carefully weighed one with the other: he considered the probabilities of a chance demand for the book over and above the sale assured from subscriptions; and offered the author a certain sum to be allowed to take the whole thing off his hands. In the case of a writer of established reputation, competition occasionally occurred amongst "the trade" for the bargain. Some of the intricacies of these transactions may be learned from Dr. Johnson's account of the manner in which Pope's Homer's *Iliad* was brought out. The poet, in his "proposals," offered the work—in six volumes quarto—for six guineas. "The great-

ness of the design," says the elegantly verbose doctor, "the popularity of the author, and the attention of the literary world, naturally raised such expectations of the future sale, that the booksellers made their offers with great eagerness; but the highest bidder was Bernard Lintot, who became proprietor on condition of supplying at his own expense all the copies which were to be delivered to subscribers or presented to friends, and paying two hundred pounds for every volume. Of the quartos, it was, I believe, stipulated that none should be printed but for the author, that the subscription might not be depreciated; but Lintot impressed the same pages upon a small folio, and paper perhaps a little thinner; and sold exactly at half the price, for half a guinea each volume, books so little inferior to the quartos, that, by a fraud of trade, those folios, being afterwards shortened by cutting away the top and bottom, were sold as copies printed for the subscribers. Lintot printed two hundred and fifty on royal paper in folio, for two guineas a volume; of the small folio, having printed seventeen hundred and fifty copies of the first volume, he reduced the number in the other volumes to a thousand. It is unpleasant to relate that the bookseller, after all his hopes and all his liberality, was, by a very unjust and illegal action, defrauded of his profit. An edition of the English *Iliad* was printed in Holland in duodecimo, and imported clandestinely for the gratification of those who were impatient to read what they could not yet afford to buy. This fraud could only be counteracted by an edition equally cheap and more commodious; and Lintot was compelled to contract his folio at once into a duodecimo, and lose the advantage of an intermediate gradation. The notes, which in the Dutch copies were placed at the end of each book, as they had been in the large volumes, were now subjoined to the text in the same page, and are therefore more easily consulted. Of this edition two thousand five hundred were first printed, and five thousand a few weeks afterwards; but indeed great numbers were necessary to produce considerable profit."

Sometimes publishers employed authors to write books for small sums; and having sufficient interest to procure the services of that very necessary person, a noble patron, obtained subscriptions on their own account in the name of the author. By this proceeding large profits were sometimes realized. Indeed, despite all drawbacks arising from piracy and other causes, some of the booksellers of this period made large fortunes. The Lintots, (of whom there were four in the trade,) the Tonsons, Curll, Cave, and other contemporary publishers, realized large sums of money by their speculations.

While, however, the patron and subscription system of bookselling was in full operation, a small and silently-working influence was gradually gaining strength to overthrow it; and this was periodical literature. By 1709, several newspapers had been established in London; but these had little or no effect upon "the trade," compared with such periodicals as the *Tatler*, *Spectator*, and *Guardian*. Not many years afterwards, (1731,) Mr. Cave conceived the idea of collecting the principal original papers from the newspapers into a monthly repository, to which the name of magazine should be applied. Hence the "Gentleman's Magazine," which began in that year, and still exists, the venerable parent of a host of lighter-headed children. Its success was so great, that

rivals soon started up. The "London," the "Monthly Review" and the "Critical," were the most remarkable: these works in time changed the whole system of bookselling. They became channels of information on literary subjects, and by their aid an author's merits were made known to the public without the intervention of a titled patron. They took the patronage of men of letters out of the hands of the great and fashionable, and transferred it to the people. Literature becoming no longer a matter of mere fashion but of intellectual taste and art, booksellers began to buy manuscripts from authors at their own risk, and to address them directly to the reading public, without the aid of previous subscribers. By this change the trade was conducted on a more solid and independent basis. That a riddance of the thralldom which literature had hitherto endured was beneficial to it, is proved from the fact, that in proportion as the subscribing plan was abandoned, (for it is not wholly given up even at present,) so the number of published works increased. From 1700 to 1756, only about 5280 new works (exclusive of tracts and pamphlets) were issued—or about ninety-three per annum; whilst from the latter year to 1803, this average of new works increased nearly ninety-three per cent.*

From the more independent system of publishing, must be dated the footing upon which the English trade now stands. The London booksellers who were rich enough to buy manuscripts, and to get them printed on their own responsibility, formed themselves into a class, who sold wholesale, and got the title of "publishers;" whilst those who retailed the works remained booksellers. It was during the latter part of the career of such men as Johnson, Goldsmith, Smollett, Fielding, Richardson, &c., that this division took place. The publishers—who chiefly resided in London or in Edinburgh—few in number, exhibited less rivalry than is usually seen in other trades. When an author presented himself whose great reputation warranted him in demanding a large price for his manuscript, the publishers united to purchase the copyright. Hence, one half of the title-pages of many works published at the end of the last century is occupied by a list of the publishers who took shares in the risk. By this sort of combination, an expensive book was "pushed" amongst the connexion of each shareholder, and had a better chance of success than if undertaken by one individual.

This sort of unanimity amongst "the trade" was very injurious to the public. It kept the price of books so high, that none but persons of fortune could afford to buy them; and the only method by which a man of moderate means could get access to them was by joining a book-club, or by borrowing from circulating libraries. But the cause of the high price of books must not be solely attributed to publishers. Paper-making and printing were at that time slow and expensive processes, and that of itself rendered books dear.

At the end of the last century, a new era dawned on the career of the book-trade. A shrewd, intelligent, but humble journeyman printer saw that the publishers of his day, by the price at which they kept their works, exclusively addressed a single class instead of the whole public. He could not, it is true—from the expense of materials—devise any plan to reduce the cost of books; but he invented a mode of issue by which they were rendered accessible to the hum-

bler classes. As this was the earliest attempt at popular bookselling, we shall dwell a little upon it, and upon its originator.

Henry Fisher, the individual alluded to, while yet a journeyman in the employment of Mr. Jonas Nuttall, the founder of the "Caxton press" in Liverpool, conceived the happy notion, that if expensive works were supplied to poorer customers in cheap parts, and periodically till complete, a vast number of persons would become eager purchasers, who regarded books as an unattainable luxury. This plan, however, had its obstacles. The easy, almost sleepy manner in which bookselling was conducted by the metropolitan publishers and their provincial agents, forbade a hope that the regular trade would second it. When, for instance, they sold a Bible, it was one transaction, which cost little trouble; but to have that Bible divided into twenty parts, and disposed of by twenty instalments, of course entailed twenty times the trouble. Such an increase of business, without the prospect of an accession of profit, was not to be thought of. Again, if even the general trade had fallen in with Fisher's views, it was quite unlikely that they could have carried them out. Their customers were few, and essentially a class; the market was limited, and something was necessary to be done to extend it. Young Fisher therefore proposed to Nuttall that he should not only print standard works in cheap numbers, but sell them upon an entirely new plan. This consisted in establishing depôts in every principal town. To each of these was attached a staff of hawkers, who branched off all over the district, going from door to door, leaving prospectuses, and offering the numbers for sale. By such means books found their way into remote places, and into houses in which they were never before seen. Though only twenty years old, Fisher was intrusted with the establishment and management of the depôt at Bristol. Amongst the first books printed for sale in this manner were the Family Bible, Bunyan's Pilgrim's Progress, Josephus, and several standard devotional works. The Bible was issued in forty parts, at a shilling each. The hawker, when he made his call, displayed the first part as a temptation. If he could not succeed in securing a customer at once, he requested permission to leave it for a week, and generally found at his second visit that a decision had been come to in favor of keeping that number, and of periodically purchasing the succeeding ones. Thus, persons who could easily afford the disbursement of a shilling a-week for the gradual purchase of a book, but would have passed their lives without entertaining the thought of giving two pounds for a Bible in one sum, became in time the possessors of a little but select library.

As a pecuniary speculation, this "number system," as it was called, succeeded beyond its projector's hopes. Fisher was employed at Bristol for three years with so much benefit to his employer and credit to himself, that Mr. Nuttall recalled him to Liverpool, took him into partnership, and allowed him, besides his share of the business, £900 a-year for managing it. The plan was adopted by others, and by none without enabling them to realize large fortunes. Several old and respectable publishers in London, Edinburgh, and Glasgow, date their origin from their founders commencing as "cavassers" in the employ of Nuttall and Fisher.

Singularly confirmative of Fisher's views was the fact that, after his plan had been extensively

* Penny Magazine, vol. vi., p. 506.

carried out for several years, it was found that it had wrought but little change on the regular trade, despite strong anticipations that so active a competition would have very much damaged it. The truth was, the market created for the "numbers" was entirely new; the people who purchased them never did buy, and never would have bought, the expensive works of the more aristocratic branches of "the trade," who, despite the vast spread of books in the substrata of society, still retained their old customers at the old prices. The great metropolitan publishers went on realizing large profits upon a limited amount of business as heretofore, till the invention of steam-printing caused them to bestir themselves a little more actively.

It was about this time (1825) that Archibald Constable of Edinburgh propounded to Sir Walter Scott and Mr. Lockhart a plan for revolutionizing the entire trade by the aid of steam and cheap printing. "Literary genius," he exclaimed, "may or may not have done its best; but printing and bookselling, as instruments for enlightening mankind, and of course for making money, are as yet in mere infancy. Yes, the trade are in their cradle." He then shadowed forth his outline:—"A three shilling or half-crown volume every month, which must and shall sell, not by thousands, or tens of thousands, but by hundreds of thousands—ay by millions! Twelve volumes in the year, a halfpenny of profit upon every copy of which will make me richer than the possession of all the copyrights of all the quartos that ever were, or will be hot-pressed!—twelve volumes so good, that millions must wish to have them; and so cheap, that every butcher's callant may have them, if he pleases to let me tax him sixpence a-week!"* Bright, and not extravagant visions; but, alas! it was destined that others should realize them. In the following year Constable was a bankrupt. When his affairs were wound up, he commenced his *Miscellany*, but with crippled means and a crushed spirit, which soon after was quelled in death. By his successors, the series was managed with little success, and after a few years it was discontinued. Still, however, the plan did not sink. Murray in his "Family Library," Longman and Co. in their "Cabinet Cyclopædia" and other such series, Colburn and Bentley in their "National Library," carried it out for several years with more or less success; and at that time it appeared as if no books other than monthly volumes at five or six shillings would sell.

Meanwhile, the Society for the Diffusion of Useful Knowledge had commenced a series of sixpenny publications, embracing the principal sciences, and thus were showing the way to still further declensions in the cost of literature. It was remarked, however, that even these comparatively cheap issues were absorbed, not by the working-classes, to whom they were professedly addressed, but by the middle ranks. And thus it has ever been with books of all kinds: direct them to one class, and they hit the next above. It became necessary, in order to reach the great bulk of the people, that cheaper works still should be presented. It was with some such views that the publishers of the present work commenced it on the 4th of February, 1832. Weekly sheets, composed of matter chiefly compiled, and aiming at no literary distinction, had previously been by no means rare; nor were they unsuccessful. But

* Lockhart's Life of Scott.

this, we believe, was the first attempt to furnish original literary matter of merit through such a medium. It was followed, almost immediately, by the well-known Penny Magazine, the Saturday Magazine, and other similar series, most of which attained, like the Journal, a circulation of many thousands. This mode of publication, followed as it has been by that of cheap editions of books in and out of copyright, has produced a great change in the trade. The warehouses of the great publishers are much less scenes of quiet and ease than they were; trouble is multiplied, and profit diminished, but the trade is enormously extended. The number of retailers of books, especially in suburban situations, has been vastly increased through the same cause. In short, a revolution has taken place, and if the bookseller now feels himself somewhat less stately and at ease than he used to be, he may have the satisfaction of feeling that his usefulness as a member of society has been greatly extended.

It is now time to give a short summary of the internal arrangements by which bookselling is carried on; for, unlike some other trades, it has few "secrets." The first step which a publisher usually takes when he has printed a new book, is to send it round to his brethren to have it "subscribed;" that is, to learn from each house how many copies they will venture to take; and, to induce them to speculate, the copies thus subscribed for are delivered at a certain per centage less than the regular trade price. The copies thus supplied to the wholesale metropolitan houses are then distributed throughout the retail trade, both in town and country; for every provincial bookseller selects a London or Edinburgh publishing house as his agent, for the supply of whatever works he may order. Such books are purchased by the agent from the publisher; and when they have accumulated sufficiently to cover the expense of carriage, they are made up into a parcel, and sent to the retailer. This generally happened, up to about ten years ago, on the last day of a month, when the magazines are published; for of them alone the general demand is so great, that they form a bulky parcel for each bookseller. In 1837, one of "the trade," many years conversant with the great literary hive of London on "Magazine Day," made the following computations: The periodical works sold on the last day of the month amounted to 500,000 copies. The amount of cash expended in the purchase of these was £25,000. The parcels despatched into the country per month were 2000. These parcels, it must be remembered, not only contained magazines, but all the works ordered during the preceding part of the month.

Since then, however, the vast increase of weekly publications, the opening of railroads, the extension of steam navigation, and other causes, have in a great measure withdrawn the bulk of books from the monthly to weekly parcels, one of which every respectable provincial bookseller now regularly receives. To estimate the contents or number of these would be impossible; but we have no hesitation in saying that they more than double the above computation in all its calculations.

We learn by the abstract of occupations from the last census, that in Great Britain there are 13,355 booksellers, publishers, and bookbinders, 5499 of whom reside in London. In Scotland, there are 2547 persons following the same trades. In Edinburgh alone, there are 766 individuals connected with "the trade."

From Fraser's Magazine.

THE MOURNER AND THE COMFORTER.

It was a lovely day in the month of August, and the sun, which had shone with undiminished splendor from the moment of dawn, was now slowly declining, with that rich and prolonged glow with which it seems especially to linger around those scenes where it seldomest finds admittance. For it was a valley in the north of Scotland into which its light was streaming, and many a craggy top and rugged side, rarely seen without their cap of clouds or shroud of mist, were now throwing their mellow-tinted forms, clear and soft, into a lake of unusual stillness. High above the lake, and commanding a full view of that and of the surrounding hills, stood one of those country hotels not unfrequently met with on a tourist's route, formerly only designed for the lonely traveller or weary huntsman, but which now, with the view to accommodate the swarm of visitors which every summer increased, had gone on stretching its cords and enlarging its boundaries, till the original tenement looked merely like the seed from which the rest had sprung. Nor, even under these circumstances, did the house admit of much of the luxury of privacy; for, though the dormitories lay thick and close along the narrow corridor, all accommodation for the day was limited to two large and long rooms, one above the other, which fronted the lake. Of these, the lower one was given up to pedestrian travellers—the sturdy, sunburnt shooters of the moors, who arrive with weary limbs and voracious appetites, and question no accommodation which gives them food and shelter; while the upper one was the resort of ladies and family parties, and was furnished with a low balcony, now covered with a rough awning.

Both these rooms, on the day we mention, were filled with numerous guests. Touring was at its height, and shooting had begun; and, while a party of wayworn young men, coarsely clad and thickly shod, were lying on the benches, or lolling out of the windows of the lower apartment, a number of travelling parties were clustered in distinct groups in the room above; some lingering round their tea-tables, whilst others sat on the balcony, and seemed attentively watching the evolutions of a small boat, the sole object on the lake before them. It is pleasant to watch the actions, however insignificant they may be, of a distant group; to see the hand obey without hearing the voice that has bidden; to guess at their inward motives by their outward movements; to make theories of their intentions, and try to follow them out in their actions; and, as at a pantomime, to tell the drift of the piece by dumb show alone. And it is an idle practice too, and one especially made for the weary or the listless traveller, giving them amusement without thought, and occupation without trouble; for people who have had their powers of attention fatigued by incessant exertion, or weakened by constant novelty, are glad to settle it upon the merest trifle at last. So the loungers on the balcony increased, and the little boat became a centre of general interest to those who apparently had not had one sympathy in common before. So calm and gliding was its motion, so refreshing the gentle air which played round it, that many an eye from the shore envied the party who were seated in it. These consisted of three individuals, two large figures and a little one.

"It is Captain H—— and his little boy," said one voice, breaking silence; "they arrived here yesterday."

"They'll be going to see the great waterfall," said another.

"They had best make haste about it; for they have a mile to walk up-hill when they land," said a third.

"Rather they than I," rejoined a languid fourth; and again there was a pause. Meanwhile the boat party seemed to be thinking little about the waterfall, or the need for expedition. For a few minutes the quick-glancing play of the oars was seen, and then they ceased again; and now an arm was stretched out towards some distant object in the landscape, as if asking a question; and then the little fellow pointed here and there, as if asking many questions at once, and, in short, the conjectures on the balcony were all thrown out. But now the oars had rested longer than usual, and a figure rose and stooped, and seemed occupied with something at the bottom of the boat. What were they about? They were surely not going to fish at this time of evening! No, they were not; for slowly a mast was raised, and a sail unfurled, which at first hung flapping, as if uncertain which side the wind would take it, and then gently swelled out to its full dimensions, and seemed too large a wing for so tiny a body. A slight air had arisen; the long reflected lines of colors, which every object on the shore dripped, as it were, into the lake, were gently stirred with a quivering motion; every soft strip of liquid tint broke gradually into a jagged and serrated edge: colors were mingled, forms were confused: the mountains, which lay in undiminished brightness above, seemed by some invisible agency to be losing their second selves from beneath them; long, cold white lines rose apparently from below, and spread radiating over all the liquid picture: in a few minutes, the lake lay one vast sheet of bright silver, and half the landscape was gone. The boat was no longer in the same element: before, it had floated in a soft, transparent ether; now, it glided upon a plain of ice.

"I wish they had stuck to their oars," said the full, deep voice of an elderly gentleman; "hoisting a sail on these lakes is very much like trusting to luck in life—it may go on all right for awhile, and save you much trouble, but you are never sure that it won't give you the slip, and that when you are least prepared."

"No danger in the world, sir," said a young fop standing by, who knew as little about boating on Scotch lakes as he did of most things anywhere else. Meanwhile, the air had become chill, the sun had sunk behind the hills, and the boating party, tired, apparently, of their monotonous amusement, turned the boat's head towards shore. For some minutes they advanced with fuller and fuller bulging sail in the direction they sought, when suddenly the breeze seemed not so much to change as to be met by another and stronger current of air, which came pouring through the valley with a howling sound, and then, bursting on the lake, drove its waters in a furrow before it. The little boat started, and swerved like a frightened creature; and the sail, distended to its utmost, cowered down to the water's edge.

"Good Heaven! why don't they lower that sail! Down with it! down with it!" shouted the same deep voice from the balcony, regardless of the impossibility of being heard. But the admo-

nition was needless; the boatman, with quick, eager motions, was trying to lower it. Still it bent, fuller and fuller, lower and lower. The man evidently strained with desperate strength, defeating, perhaps, with the clumsiness of anxiety, the end in view; when, too impatient, apparently, to witness their urgent peril without lending his aid, the figure of Captain H— rose up; in one instant a piercing scream was borne faintly to shore—the boat whelmed over, and all were in the water.

For a few dreadful seconds nothing was seen of the unhappy creatures; then a cap floated, and then two struggling figures rose to the surface. One was evidently the child, for his cap was off, and his fair hair was seen; the other head was covered. This latter buffeted the waters with all the violence of a helpless, drowning man; then he threw his arms above his head, sank, and rose no more. The boy struggled less and less, and seemed dead to all resistance before he sank too. The boat floated keel upwards, almost within reach of the sufferers; and now that the waters had closed over them, the third figure was observed, for the first time, at a considerable distance, slowly and laboriously swimming towards it, and in a few moments two arms were flung over it, and there he hung. It was one of those scenes which the heart quails to look on, yet which chains the spectator to the spot. The whole had passed in less than a minute: fear—despair—agony—and death, had been pressed into one of those short minutes, of which so many pass without our knowing how. It is well. Idleness, vanity, or vice—all that dismisses thought—may dally with time, but the briefest space is too long for that excess of consciousness where time seems to stand still.

At this moment a lovely and gentle-looking young woman entered the room. It was evident that she knew nothing of the dreadful scene that had just occurred, nor did she now remark the intense excitement which still riveted the spectators to the balcony; for, seeking, apparently, to avoid all intercourse with strangers, she had seated herself, with a book, on the chair farthest removed from the window. Nor did she look up at the first rush of hurried steps into the room; but, when she did, there was something which arrested her attention, for every eye was fixed upon her with an undefinable expression of horror, and every foot seemed to shrink back from approaching her. There was also a murmur as of one common and irrepressible feeling through the whole house; quick footsteps were heard as of men impelled by some dreadful anxiety; doors were banged; voices shouted; and, could any one have stood by a calm and indifferent spectator, it would have been interesting to mark the sudden change from the abstracted and composed look with which Mrs. H— (for she it was) first raised her head from her book to the painful restlessness of inquiry with which she now glanced from eye to eye, and seemed to question what manner of tale they told.

It is something awful and dreadful to stand before a fellow-creature laden with a sorrow which, however we may commiserate it, it is theirs alone to bear; to be compelled to tear away that veil of unconsciousness which alone hides their misery from their sight; and to feel that the faintness gathering round our own heart alone enables them to continue beating with tranquillity. We feel less almost of pity for the suffering we are about to

inflict than for the peace which we are about to remove; and the smile of unconsciousness which precedes the knowledge of evil is still more painful to look back upon than the bitterest tear that follows it. And, if such be the feelings of the messenger of heavy tidings, the mind that is to receive them is correspondingly actuated. For who is there that thanks you really for concealing the evil that was already arrived—for prolonging the happiness that was already gone? Who cares for a reprieve when sentence is still to follow! It is a pitiful soul that does not prefer the sorrow of certainty to the peace of deceit; or, rather, it is a blessed provision which enables us to acknowledge the preference when it is no longer in our power to choose. It seems intended as a protection to the mind from something so degrading to it as an unreal happiness, that both those who have to inflict misery and those who have to receive it should alike despise its solace. Those who have trod the very brink of a precipice, unknowing that it yawned beneath, look back to those moments of their ignorance with more of horror than of comfort; such security is too close to danger for the mind ever to separate them again. Nor need the bearer of sorrow embitter his errand by hesitations and scruples how to disclose it; he need not pause for a choice of words or form of statement. In no circumstance of life does the soul act so utterly independent of all outward agency; it waits for no explanation, wants no evidence; at the furthest idea of danger it flies at once to its weakest part; an embarrassed manner will rouse suspicions, and a faltering word confirm them. Dreadful things never require precision of terms—they are wholly guessed before they are half told. Happiness the heart believes not in till it stands at our very threshold; misery it flies as if eager to meet.

So it was with the unfortunate Mrs. H—; no one spoke of the accident, no one pointed to the lake: no connecting link seemed to exist between the security of ignorance and the agony of knowledge. At one moment she raised her head in placid indifference, at the next she knew that her husband and child were lying beneath the waters. And did she faint, or fall as one stricken? No: for the suspicion was too sudden to be sustained; and the next instant came the thought, this must be a dream; God cannot have done it. And the eyes were closed, and the convulsed hands pressed tight over them, as if she would shut out mental vision as well; and groans and sobs burst from the crowd, and men dashed from the room, unable to bear it; and women too, untrue to their calling. And there was weeping and wringing of hands, and one weak woman fainted; but still no sound or movement came from her on whom the burden had fallen. Then came the dreadful revulsion of feeling; and, with contracted brow and gasping breath, and voice pitched almost to a scream, she said, "It is not true—tell me—it is not true—tell me—tell me!" And, advancing with desperate gestures, she made for the balcony. All recoiled before her; when one gentle woman, small and delicate as herself, opposed her, and, with streaming eyes and trembling limbs, stood before her. "Oh, go not there—go not there! cast your heavy burden on the Lord!" These words broke the spell. Mrs. H— uttered a cry which long ran in the ears of those that heard it, and sank, shivering and powerless, in the arms of the kind stranger.

Meanwhile, the dreadful scene had been witnessed from all parts of the hotel, and every male inmate poured from it. The listless tourist of fashion forgot his languor, the wayworn pedestrian his fatigue. The hill down to the lake was trodden by eager, hurrying figures, all anxious to give that which in such cases it is a relief to give, viz., active assistance. Nor were these all, for down came the sturdy shepherd from the hills; and the troops of ragged, bare-legged urchins from all sides; and distant figures of men and women were seen pressing forward to help or to hear; and the hitherto deserted-looking valley was active with life. Meanwhile, the survivor hung motionless over the upturned boat, borne about at the will of the waters, which were now lashed into great agitation. No one could tell whether it was Captain H—— or the Highland boatman, and no one could wish for the preservation of the one more than the other. For life is life to all; and the poor man's wife and family may have less time to mourn, but more cause to want. And before the boat, that was manning with eager volunteers, had left the shore, down came also a tall, raw-boned woman, breathless, more apparently with exertion than anxiety—her eyes dry as stones, and her cheeks red with settled color; one child dragging at her heels, another at her breast. It was the boatman's wife. Different, indeed, was her suspense to that of the sufferer who had been left above; but, perhaps, equally true to her capacity. With her it was fury rather than distress; she scolded the bystanders, chid the little squalling child, and abused her husband by turns.

"How dare he gang to risk his life, wi' six bairns at hame! Ae body knew nae sail was safe on the lake for twa hours together; mair fule he to try!" And then she flung the roaring child on to the grass, bade the other mind it, strode half-leg high into the water to help to push off the boat; and then, returning to a place where she could command a view of its movements, she took up the child and hushed it tenderly to sleep. Like her, every one now sought some elevated position, and the progress of the boat seemed to suspend every other thought. It soon neared the fatal spot, and in another minute was alongside the upturned boat; the figure was now lifted carefully in, something put round him, and, from the languor of his movements, and the care taken, the first impression on shore was that Captain H—— was the one spared. But it was a mercy to Mrs. H—— that she was not in a state to know these surmises; for soon the survivor sat steadily upright, worked his arms, and rubbed his head, as if to restore animation; and, long before the boat reached the shore, the coarse figure and garments of the Highland boatman were distantly recognized. Up started his wife. Unaccustomed to mental emotions of any sudden kind, they were strange and burdensome to her.

"What, Meggy! no stay to welcome your husband!" said a bystander.

"Welcome him yoursal," she replied; "I hae no the time. I maun get his dry claes, and het his parritch; and that 's the best welcome I can gie him." And so, perhaps, the husband thought too.

And now, what was there more to do! The bodies of Captain H—— and his little son had sunk in seventy fathom deep of water. If, in their hidden currents and movements they cast their victims aloft to the surface, all well; if not, no human hand could reach them. There was no-

thing to do! Two beings had ceased to exist, who, as far as regarded the consciousness and sympathies of the whole party, had never existed at all before. There had been no influence upon them in their lives, there was no blank to them in their deaths. They had witnessed a dreadful tragedy; they knew that she who had risen that morning a happy wife and mother was now widowed and childless, with a weight of woe upon her, and a life of mourning before her; but there were no forms to observe, no rites to prepare; nothing necessarily to interfere with one habit of the day, or to change one plan for the morrow. It was only a matter of feeling; a great *only* it is true; but, as with everything in life, from the merest trifle to the most momentous occurrence, the matter varied with the individual who felt. All pitied, some sympathized, but few ventured to help. Some wished themselves a hundred miles off, because they could not help her; others wished the same, because she distressed them; and the solitary back room, hidden from all view of the lake, to which the sufferer had been borne, after being visited by a few well-meaning or curious women, was finally deserted by all save the kind lady we have mentioned, and a good-natured maid-servant, the drudge of the hotel, who came in occasionally to assist.

We have told the tale exactly as it occurred; the reader knows both plot and conclusion; and now there only remains to say something of the ways of human sorrow, and something, too, of the ways of human goodness.

Grief falls differently on different hearts; some must vent it, others cannot. The coldest will be the most unnerved, the tenderest the most possessed; there is no rule. As for this poor lady, hers was of that sudden and extreme kind for which insensibility is at first mercifully provided; and it came to her, and yet not entirely—suspending the sufferings of the mind, but not deadening all the sensation of the body; for she shivered and shuddered with that bloodless cold which kept her pale, numb, and icy, like one in the last hours before death. A large fire was lighted, warm blankets were wrapped round her, but the cold was too deep to be reached; and the kind efforts made to restore animation were more a relief to her attendants than to her. And yet Miss Campbell stopped sometimes from the chafing of the hands, and let those blue fingers lie motionless in hers, and looked up at that wan face with an expression as if she wished that the eyes might never open again, but that death might at once restore what it had just taken. For some hours no change ensued, and then it was gradual; the hands were withdrawn from those that held them, and first laid, and then clenched together; deep sighs of returning breath and returning knowledge broke from her; the wrappers were thrown off, first feebly, and then restlessly. There were no dramatic startings, no abrupt questionings; but, as blood came back to the veins, anguish came back to the heart. All the signs of excessive mental oppression now began, a sad train as they are, one extreme leading to the other. Before, there had been the powerlessness of exertion, now, there was the powerlessness of control; before she had been benumbed by insensibility, now, she was impelled as if bereft of sense. Like one distracted with intense bodily pain, her whole frame seemed strained to endure. The gentlest of voices whispered comfort, she heard not; the

kindest of arms supported her, she rested not. There was the unvarying moan, the weary pacing, the repetition of the same action, the measurement of the same distance, the body vibrating as a mere machine to the restless recurrence of the same thought.

We have said that every outer sign of woe was there—all but that which great sorrows set flowing, but the greatest dry up—she shed no tears! Tears are things for which a preparation of the heart is needful; they are granted to anxiety for the future, or lament for the past. They flow with reminiscences of our own, or with the example of others; they are sent to separations we have long dreaded, and to disappointments we cannot forget; they come when our hearts are softened, or when our hearts are wearied; but, in the first amazement of unlooked-for woe, they find no place: the cup that is suddenly whelmed over lets no drop of water escape.

It was evident, however, through all the unruliness of such distress, that the sufferer was a creature of gentle and considerate nature; in the whirlpool which convulsed every faculty of her mind, the smooth surface of former habits was occasionally thrown up. Though the hand which sought to support her was cast aside with a restless, excited movement, it was sought the next instant with a momentary pressure of contrition. Though the head was turned away one instant from the whisper of consolation with a gesture of impatience, yet it was bowed the next as if in entreaty of forgiveness. Poor creature! what effort she could make to allay the storm which was rioting within her was evidently made for the sake of those around. With so much and so suddenly to bear, she still showed the habit of forbearance.

Meanwhile night had far advanced; many had been the inquiries and expressions of sympathy made at Mrs. H—'s door; but now, one by one, the parties retired each to their rooms. Few, however, rested that night as usual; however differently the terrible picture might be carried on the mind during the hours of light, it forced itself with almost equal vividness upon all in those of darkness. The father struggling to reach the child, and then throwing up his arms in agony, and that fair little head borne about unresistingly by the waves before they covered it over—these were the figures which haunted many a pillow. Or, if the recollection of that scene was lulled for awhile, it was recalled again by the weary sound of those footsteps which told of a mourner who rested not. Of course, among the number and medley of characters lying under that roof, there was the usual proportion of the selfish and the careless. None, however, slept that night without confessing, in word or thought, that life and death are in the hands of the Lord; and not all, it is to be hoped, forgot the lesson. One young man, in particular, possessed of fine intellectual powers, but which unfortunately had been developed among a people who, God help them! affect to believe only what they understand, was indebted to this day and night for a great change in his opinions. His heart was kind, though his understanding was perverted; and the thought of that young, lovely, and feeble woman, on whom a load of misery had fallen which would have crushed the strongest of his own sex, roused within him the strongest sense of the insufficiency of all human aid or human strength for beings who

are framed to love and yet ordained to lose. He was oppressed with compassion, miserable with sympathy; he longed with all the generosity of a manly heart to do something, to suggest something, that should help her, or satisfy himself. But what were fortitude, philosophy, strength of mind! Mockeries, nay, more, imbecilities, which he dared not mention to her, nor so much as think of in the same thought with her woe. Either he must accuse the Power who had inflicted the wound, and so deep he had not sunk, or he must acknowledge His means of cure. Impelled, therefore, by a feeling equally beyond his doubting or his proving, he did that which for years German sophistry had taught him to forbear; he gave but little, but he felt that he gave his best—he *prayed* for the suffering creature, and in the name of One who suffered for all, and from that hour God's grace forsook him not.

But the most characteristic sympathizer on the occasion was Sir Thomas —, the fine old gentleman who had shouted so loudly from the balcony. He was at home in this valley, owned the whole range of hills on one side of the lake, from their fertile bases to their bleak tops, took up his abode generally every summer in this hotel, and felt for the stricken woman as if she had been a guest of his own. Ever since the fatal accident he had gone about in a perfect fret of commiseration, inquiring every half hour at her door how she was, or what she had taken. Severe bodily illness or intense mental distress had never fallen upon that bluff person and warm heart, and abstinence from food was in either case the proof of an extremity for which he had every compassion, but of which he had no knowledge. He prescribed, therefore, for the poor lady everything that he would have relished himself, and nothing at that moment could have made him so happy as to have been allowed to send her up the choicest meal that the country could produce. Not that his benevolence was at all limited to such manifestations; if it did not deal in sentiment, it took the widest range of practice. His laborers were despatched round the lake to watch for any traces of the late catastrophe; he himself kept up an hour later planning how he could best promote the comfort of her onward journey and of her present stay; and though the good old gentleman was now snoring loudly over the very apartment which contained the object of his sympathy, he would have laid down his life to save those that were gone, and half his fortune to solace her who was left.

Some hours had elapsed—the footsteps had ceased, there was quiet if not rest, in the chamber of mourning; and, shortly after sunrise, a side door in the hotel opened, and she who had been as a sister to the stranger, never seen before, came slowly forth. She was worn with watching, her heart was sick with the sight and sounds of such woe, and she sought the refreshment of the outer air and the privacy of the early day. It was a dawn promising a day as beautiful as the preceding; the sun was beaming mildly through an opening towards the east, wakening the tops of the nearest hills, while all the rest of the beautiful range lay huge and colorless, nodding, as it were, to their drowsy reflections beneath, and the lake itself looked as calm and peaceful as if the winds had never swept over its waters, nor those waters over all that a wife and mother had loved. Man is such a speck on this creation of which he is lord, that had every human being now sleeping

on the green sides of the hills, been lying deep among their dark feet in the lake, it would not have shown a ripple the more.

Miss Campbell, meanwhile, wandered slowly on, and though apparently unmindful of the beauty of the scene, she was evidently soothed by its influence. All that dreary night long had she cried unto God in ceaseless prayer, and felt that without His help in her heart, and His word on her lips, she had been but as a strengthless babe before the sight of that anguish. But here beneath His own heavens her communings were freer; her soul seemed not so much to need Him below, as to rise to Him above; and the solemn dejection upon a very careworn but sweet face, became less painful, but perhaps more touching. In her wanderings she had now left the hotel to her left hand, the boatman's clay cottage was just above, and below a little rough pier of stones, to an iron ring in one of which the boat was usually attached. She had stood on that self-same spot the day before and watched Captain H—— and his little son as they walked down to the pier, summoned the boatman, and launched into the cool, smooth water. She now went down herself, and stood with a feeling of awe upon the same stones they had so lately left. The shores were loose and shingly, many footsteps were there, but one particularly riveted her gaze. It was tiny in shape and light in print, and a whole succession of them went off towards the side as if following a butterfly, or attracted by a bright stone. Alas! they were the last prints of that little foot on the shores of this world! Miss Campbell had seen the first thunderbolt of misery burst upon his mother; she had borne the sight of her as she lay stunned, and as she rose frenzied, but that tiny footprint was worse than all, and she burst into a passionate fit of tears. She felt as if it were desecration to sweep them away, as if she could have shrined them round from the winds and waves, and thoughtless tread of others; but a thought came to check her. What did it matter how the trace of his little foot, or how the memory of his short life, were obliterated from this earth? There was One above who had numbered every hair of his innocent head, and in His presence she humbly hoped both father and child were now rejoicing.

She was just turning away when the sound of steps approached, and the boatman's wife came up. Her features were coarse and her frame gaunt, as we have said, but she was no longer the termagant of the day before, nor was she ever so. But the lower classes in the most civilized lands, are often, both in joy and grief, an enigma to those above them; if nature, rare alike in all ranks, speak not for them, they have no conventional imitation to put in her place. The feeling of intense suspense was new to her, and the violence she had assumed had been the awkwardness which, under many eyes, knew not otherwise how to express or conceal; but she had sound Scotch sense, and a tender woman's heart, and spoke them both now truly, if not gracefully.

"Ye'll be frae the hotel, yonder?" she said; "can ye tell me how the puir leddy has rested? I was up mysel' to the house, and they tell't me they could hear her greeting!"

Miss Campbell told her in a few words what the reader knows, and asked for her husband.

"Oh! he's weel enough in body, but sair disquieted in mind. No that he's unmindfu' of the mercy of the Lord to himsel', but he can no just

keep the thocht away that it was he wha helped those poor creatures to their end." She then proceeded earnestly to exculpate her husband, assuring Miss Campbell that in spite of the heavy wind and the entangled rope, all might even yet have been well if the gentleman had kept his seat. "But I just tell him that there's Ane above, stronger than the wind, who sank them in the lake, and could have raised them from it, but it was no His pleasure. The puir leddy would ha' been nane the happier if Andrew had been ta'en as well, and I and the bairns muckle the waur." Then observing where Miss Campbell stood, she continued, in a voice of much emotion, "Ah! I mind them weel as they came awa' down here; the bairnie was playing by as Andrew loosened the boat—the sweet bairnie! so happy and thochtless as he gaed in his beautiful claes—I see him noo!" and the poor woman wiped her eyes. "But there's something ye'll like to see. Jeanie! gang awa' up, and bring the litle bonnet that hangs on the peg. Andrew went out again with the boat the night, and picked it up. But it will no be dry."

The child returned with a sad token. It was the little fellow's cap; a smart town-made article, with velvet band, and long silk tassel, that tassel which had been his first vanity, and his mother had coaxed it smooth as she pulled the peak low down over his fair forehead, and then, fumbling his little fingers into his gloves, had given him a kiss which she little thought was to be the last!

"I was coming awa' up wi' it mysel' but the leddy will no just bear to see it yet."

"No, not yet," said Miss Campbell, "if ever. Let me take it. I shall remain with her till better friends come here, or she goes to them;" and giving the woman money which she had difficulty in making her accept, she possessed herself of the cap and turned away.

She soon reached the hotel, it was just five o'clock, all blinds were down, and there was no sign of life; but one figure was pacing up and down, and seemed to be watching for her. It was Sir Thomas. His sympathy had broken his sleep in the morning, though it had not disturbed it at night. He began in his abrupt way:—

"Madam, I have been watching for you. I heard you leave the house. Madam, I feel almost ashamed to lift up my eyes to you; whilst we have all been wishing and talking, you alone have been acting. We are all obliged to you madam; there is not a creature here with a heart in them to whom you have not given comfort!"

Miss Campbell tried to escape from the honest overflowings of the old man's feelings.

"You have only done what you liked: very true, madam. It is choking work having to pity without knowing how to help; but I would sooner give ten thousand pounds than see what you have seen. I would do anything for the poor creature, anything, but I could not look at her." He then told her that his men had been sent with the earliest dawn to different points of the lake, but as yet without finding any traces of the late fatal accident; and then his eyes fell upon the cap in Miss Campbell's hand, and he at once guessed the history. "Picked up last evening, you say—sad, sad—a dreadful thing!" and his eyes filling more than it was convenient to hold, he turned away, blew his nose, took a short turn, and coming back again continued, "But tell me how has she rested! what has she taken? You must not let her weep too much!"

"Let her weep!" said Miss Campbell, "I wish I could bid her. She has not shed a tear yet, and mind and body alike want it. I left her lying back quiet in an arm-chair, but I fear this quiet is worse than what has gone before!"

"God bless my heart!" said Sir Thomas, his eyes now running over without control. "God bless my heart! this is sad work. Not that I ever wished a woman to cry before in my life, if she could help it. Poor thing! poor thing! I'll send for a medical man: the nearest is fifteen miles off!"

"I think it will be necessary. I am now going back to her room."

"Well, ma'am, I won't detain you longer, but don't keep all the good to yourself. Let me know if there is anything that I, or my men, or," the old gentleman hesitated, "my money, madam, can do, only don't ask me to see her;" and so they each went their way—Sir Thomas to the stables to send off man and horse, and Miss Campbell to the chamber of mourning.

She started as she entered; the blind was drawn up, and, leaning against the shutter, in apparent composure, stood Mrs. H—. That composure was dreadful; it was the calm of intense agitation, the silence of boiling heat, the immovability of an object in the most rapid motion. The light was full upon her, showed cheek and forehead flushed, and veins bursting on the small hands. Miss Campbell approached with trembling limbs.

"Where is the servant?"

"I did not want her."

"Will you not rest!"

"I cannot!"

Miss Campbell was weary and worn out; the picture before her was so terrible, she sunk on the nearest chair in an agony of tears.

Without changing her position, Mrs. H— turned her head, and said gently, "Oh, do not cry so! it is I who ought to cry, but my heart is as dry as my eyes, and my head is so tight, and I cannot think for its aching; I cannot think, I cannot understand, I cannot remember, I don't even know your name, then why should this be true! It is I who am ill, they are well, but they never were so long from me before." Then coming forward, her face working, and her breath held tightly, as if a scream were pressing behind, "Tell me," she said, "tell me—my husband and child—" she tried hard to articulate, but the words were lost in a frightful contortion. Miss Campbell mastered herself, she saw that the rack of mental torture was strained to the utmost. Neither could bear this much longer. She almost feared resistance, but she felt there was one way to which the sufferer would respond,—

"I am weary and tired," she said, "weary with staying up with you all night. If you will lie down, I will soon come and lie by your side."

Poor Mrs. H— said nothing, but let herself be laid upon the bed.

Three mortal hours passed, she was burnt with a fever which only her own tears could quench; and those wide-open, dry eyes were fearful to see. A knock came to the door, "How is she now?" said Sir Thomas' voice. "The doctor is here: you look as if you wanted him yourself. I'll bring him up."

The medical man entered. Such a case had not occurred in his small country practice before, but he was a sensible and a kind man, and no

practice could have helped him here if he had not been. He heard the whole sad history, felt the throbbing pulse, saw the flush on the face, and wide open eyes, which now seemed scarcely to notice anything. He took Miss Campbell into another room, and said that the patient must be instantly roused, and then bled if necessary.

"But the first you can undertake better than I, madam." He looked round. "Is there no little object which would recall?—nothing you could bring before her sight? You understand me?"

Indeed Miss Campbell did. She had not sat by that bedside for the last three hours without feeling and fearing that this was necessary; but, at the same time, she would rather have cut off her own hand than undertaken it. She hesitated—but for a moment, and then whispered something to Sir Thomas.

"God bless my heart!" said he, "who would have thought of it? Yes. I know it made me cry like a child."

And then he repeated her proposition to the medical man, who gave immediate assent, and she left the room. In a few minutes she entered that of Mrs. H— with the little boy's cap in her hand, placed it in a conspicuous position before the bed, and then seated herself with a quick, nervous motion by the bedside. It was a horrid pause, like that which precedes a cruel operation, where you have taken upon yourself the second degree of suffering—that of witnessing it. The cap lay there on the small stone mantelpiece, with its long, drabbed, weeping tassel, like a funeral emblem. It was not many minutes before it caught those eyes for which it was intended. A suppressed exclamation broke from her; she flew from the bed, looked at Miss Campbell one instant in intense inquiry, and the next had the cap in her hands. The touch of that wet object seemed to dissolve the spell; her whole frame trembled with sudden relaxation. She sank, half kneeling, on the floor, and tears spouted from her eyes. No blessed rain from heaven to famished earth was ever more welcome. Tears, did we say? Torrents! Those eyes, late so hot and dry, were as two arteries of the soul suddenly opened. What a misery that had been which had sealed them up! They streamed over her face, blinding her riveted gaze, falling on her hands, on the cap, on the floor. Meanwhile the much-to-be-pitied sharer of her sorrow knelt by her side, her whole frame scarcely less unnerved than that she sought to support, uttering brokelt ejaculations and prayers, and joining her tears to those which flowed so passionately. But she had a gentle and meek spirit to deal with. Mrs. H— crossed her hands over the cap and bowed her head. Thus she continued a minute, and then turning, still on her knees, she laid her head on her companion's shoulder.

"Help me up," she said, "for I am without strength." And all weak, trembling, and sobbing, she allowed herself to be undressed and put to bed.

Miss Campbell lay down in the same room. She listened till the quivering, catching sobs had given place to deep-drawn sighs, and these again to disturbed breathings, and then both slept the sleep of utter exhaustion, and Miss Campbell, fortunately, knew not when the mourner awoke from it.

Oh, the dreary first-fruits of excessive sorrow! The first days of a stricken heart, passed through,

writhed through, ground through, we scarcely know or remember how, before the knowledge of the bereavement has become habitual—while it is still struggle and not endurance—the same ceaseless recoil from the same ever-recurring shock. It was a blessing that she was ill, very ill; the body shared something of the weight at first.

Let no one, untried by such extremity, here lift the word or look of deprecation. Let there not be a thought of what she ought to have done, or what they would have done. God's love is great, and a Christian's faith is strong, but when have the first encounters between old joys and new sorrows been otherwise than fierce? From time to time a few intervals of heavenly composure, wonderful and gracious to the sufferer, may be permitted, and even the dim light of future peace discerned in the distance; but, in a moment, the gauntlet of defiance is thrown again—no matter what—an old look, an old word, which comes rushing unbidden over the soul, and dreadful feelings rise again only to spend themselves by their own violence. It always seems to us as if sorrow had a nature of its own, independent of that whereon it has fallen, and sometimes strangely at variance with it—scorching the gentle, melting the passionate, dignifying the weak, and prostrating the strong—and showing the real nature, habits, or principles of the mind, only in those defences it raises up during the intervals of relief. With Mrs. H—these defences were reared on the only sure base, and though the storm would sweep down her bulwarks, and cover all over with the furious tide of grief, yet the foundation was left to cling to, and every renewal added some object to its strength.

Three days were spent thus, but the fourth she was better, and on Miss Campbell's approaching her bedside, she drew her to her, and, putting her arms round her neck, imprinted a calm and solemn kiss upon her cheek.

"Oh! what can I ever do for you, dear friend and comforter! God, who has sent you to me in my utmost need, He alone can reward you. I don't even know your name; but that matters not, I know your heart. Now you may tell me all—all; before, I felt as if I could neither know nor forget what had happened, before, it was as if God had withdrawn His countenance; but now He is gracious, He has heard your prayers."

And then, with the avidity of fresh, hungry sorrow, she besought Miss Campbell to tell her all she knew; she besought and would not be denied, for sorrow has royal authority, its requests are commands. So, with the hand of each locked together, and the eyes of each averted, they sat questioning and answering in disjointed sentences till the whole sad tale was told. Then, anxious to turn a subject which could not be banished, Miss Campbell spoke of the many hearts that had bled, and the many prayers that had ascended for her, and told her of that kind old man who had thought, acted, and grieved for her like a father.

"God bless him—God bless them all; but chiefly you, my sister. I want no other name."

"Call me Catherine," said the faithful companion.

Passionate bursts of grief would succeed such conversations; nevertheless they were renewed again and again, for, like all sufferers from severe bereavements, her heart needed to create a world for itself, where its loved ones still were, as a defence against that outer one where they were

not, and to which she was only slowly and painfully to be inured, if ever. In these times she would love to tell Catherine—what Catherine most loved to hear—how that her lost husband was both a believer and a doer of Christ's holy word, and that her lost child had learned at her knee what she herself had chiefly learned from his father. For she had been brought up in ignorance and indifference to religious truths, and the greatest happiness of her life had commenced that knowledge, which its greatest sorrow was now to complete.

"I have been such a happy woman," she would say, "that I have pitied others less blessed, though I trust they have not envied me." And then would follow sigh on sigh and tear on tear, and again her soul writhed beneath the agony of that implacable mental spasm.

Sometimes the mourner would appear to lose, instead of gaining ground, and would own with depression, and even with shame, her fears that she was becoming more and more the sport of un-governable feeling. "My sorrow is sharp enough," she would say, "but it is a still sharper pang when I feel I am not doing my duty under it. It is not thus that *he* would have had me act." And her kind companion, always at hand to give sympathy or comfort, would bid her not exact or expect anything from herself, but to cast all upon God, reminding her in words of tenderness that her soul was as a sick child, and that strength would not be required until strength was vouchsafed. "Strength," said the mourner, "no more strength or health for me." And Miss Campbell would whisper that, though "weariness endureth for a night, joy comes in the morning." Or she would be silent, for she knew, as most women do, alike how to soothe and when to murmur.

It was a beautiful and a moving sight to see two beings thus riveted together in the exercise and receipt of the tenderest and most intimate feelings, who had never known of each other's existence till the moment that made the one dependent and the other indispensable. All the shades and grades of conventional and natural acquaintance-ship, all the gradual insight into mutual character, and the gradual growth into mutual trust, which is so sweet to look back upon from the high ground of friendship, were lost to them; but it mattered not,—here they were together, the one admitted into the sanctuary of sorrow, the other sharing in the fulness of love, with no reminiscence in common but one, and that sufficient to bind them together for life.

Meanwhile the friend without was also unremitting in his way. He crossed not her threshold in person, nor would have done so for the world, but his thoughts were always reaching Mrs. H— in some kind form. Every delicate dainty that money could procure—beautiful fruits and flowers which had scarce entered this valley before—everything that could tempt the languid appetite or divert the weary eye was in turn thought of, and each handed in with a kind heart, hearty inquiry, till the mourner listened with pleasure for the step and voice. Nor was Miss Campbell forgotten; all the brief sojourns of air and exercise she enjoyed were in his company, and often did he insist on her coming out for a short walk or drive when the persuasions of Mrs. H— had failed to induce her to leave a room where she was the only joy. But now a fresh object attracted Sir Thomas' activity, for after many days the earthly remains of one of the suf-

ferers was thrown up. It was the body of the little boy. Sir Thomas directed all that was necessary to be done, and having informed Miss Campbell, the two friends, each strange to the other, and bound together by the interest in one equally strange to both, went out together up the hill above the hotel, and were gone longer than usual. The next day the intelligence was communicated to Mrs. H——, who received it calmly, but added, "I could have wished them both to have rested together; but God's will be done. I ought not to think of them as on the earth."

The grave of little Harry H—— was dug far from the burial-ground of his fathers, and strangers followed him to it; but though there were no familiar faces among those who stood round, there were no cold ones; and when Sir Thomas, as chief mourner, threw the earth upon the lowered coffin, warm tears fell upon it also. Miss Campbell had watched the procession from the window, and told how good the old man walked behind the minister, the boatman and his wife followed him, and how a long train succeeded, all pious and reverential in their bearing, with that air of manly decorum which the Scotch peasantry conspicuously show on such occasions. And she who lay on a bed of sorrow and weakness blessed them through her tears, and felt that her child's funeral was not lonely.

From this time the mourner visibly mended. The funeral and the intelligence that preceded it had insensibly given her that change of the same theme, the want of which had been so much felt at first. She had now taken up her burden, and, for the dear sakes of those for whom she bore it, it became almost sweet to her. She was not worshipping her sorrow as an idol, but cherishing it as a friend. Meanwhile she had received many kind visits from the minister who had buried her child, and had listened to his exhortations with humility and gratitude; but his words were felt as admonitions, Catherine's as comfort. To her, now dearer and dearer, every day she would confess aloud the secret changes of her heart; how at one time the world looked all black and dreary before her, how at another she seemed already to live in a brighter one beyond; how one day life was a burden she knew not how to bear, and another how the bitterness of death seemed already past. Then with true Christian politeness she would lament over the selfishness of her grief, and ask where Miss Campbell had learned to know that feeling which she felt henceforth was to be the only solace of her life—viz., the deep, deep sympathy for others. And Catherine would tell her, with that care-worn look which confirmed all she said, how she had been sorely tried, not by the death of those she loved, but by what was worse—their sufferings and their sins. How she had been laden with those misfortunes which wound most and teach least, and which, although coming equally from the hand of God, torment you with the *in* that, but for the wickedness or weakness of some human agent, they need never have been; till she had felt, wrongly no doubt, that she could have better borne those on which the stamp of the Divine Will was more legibly impressed. She told her how the sting of sorrow, like that of death, is sin; how comparatively light it was to see those you love dead, dying, crippled, maniacs, victims, in short, of any evil, rather than victims of evil itself. She spoke of a heart-broken sister and of a hard-hearted brother; of a son—an only son, like him

just buried—who had gone on from sin to sin, hardening his own heart, and wringing those of others, till none but a mother's love remained to him, and that he outraged. She told, in short, so much of the sad realities of life, in which, if there was not more woe, there was less comfort, that Mrs. H—— acknowledged in her heart that such griefs had indeed been unendurable, and returned with something like comfort to the undisturbed sanctity of her own.

About this time a summons came which required Sir Thomas to quit the valley in which these scenes had been occurring. Mrs. H—— could have seen him, and almost longed to see him; but he shrunk from her, fearing no longer her sorrow so much as her gratitude.

"Tell her I love her," he said, in his abrupt way, "and always shall; but I can't see her—at least, not yet." Then explaining to Miss Campbell all the little arrangements for the continuation of the mourner's comfort, which his absence might interrupt, he authorized her to dispose of his servants, his horses, and everything that belonged to him, and finally put into her hands a small packet directed to Mrs. H——, with instructions when to give it. He had ascertained that Mrs. H—— was wealthy, and that her great afflictions entailed no minor privations. "But you, my dear, are poor; at least, I hope so, for I could not be happy unless I were of service to you. I am just as much obliged to you as Mrs. H—— is. Mind, you have promised to write to me and to apply to me without reserve. No kindness, no honor—nonsense. It is *I* who honor *you* above every creature I know, but I would not be a woman for the world; at least the truth is *I could not*." And so he turned hastily away.

And now the time approached when she, who had entered this valley a happy wife and mother, was to leave it widowed and childless, a sorrowing and heavy-hearted woman, but not an unhappy one. She had but few near relations, and those scattered in distant lands: but there were friends who would break the first desolation of her former home, and Catherine had promised to bear her company till she had committed her into their hands.

It was a lovely evening, the one before their departure; Mrs. H—— was clad for the first time in all that betokened her to be a mourner; but, as Catherine looked from the black habiliments to that pale face, she felt that there was the deepest mourning of all. Slowly the widow passed through that side-door we have mentioned, and stood once more under God's heaven. Neither had mentioned to the other the errand on which they were bound, but both felt that there was but one. Slowly and feebly she mounted the gentle slope, and often she stopped, for it was more than weakness or fatigue that made her breath fail. The way was beautiful, close to the rocky bed and leafy sides of that sweetest of all sweet things in the natural world, a Scotch burn. And now they turned, for the rich strip of grass, winding among bush and rock, which they had been following as a path, here spread itself out in a level shelf of turf, where the burn ran smoother, the bushes grew higher, and where the hill started upward again in bolder lines. Here there was a fresh covered grave. The widow knelt by it, while Catherine stood back. Long was that head bowed, first in anguish, and then in submission, and then she turned her face toward the lake, on which she had not

looked since that fatal day, and gazed steadily upon it. The child lay in his narrow bed at her feet, but the father had a wider one far beneath. Catherine now approached and was folded in a silent embrace; then she gave her that small packet which Sir Thomas had left, and begged her to open it upon the spot. It was a legal deed, making over to Mary H—, in free gift, the ground on which she stood—a broad strip from the tip of the hill to the waters of the lake. The widow's tears rained fast upon it.

"Both God and man are very good to me," she said; "I am lonely, but not forsaken. But, Catherine, it is you to whom I must speak. I have tried to speak before, but never felt I could till now. Oh, Catherine! stay with me—live with me; let us never be parted. God gave you to me when He took all else beside; He has not done it for nought. I can bear to return to my lonely home if you will share it—I can bear to see this valley, this grave again, if you are with me. I am not afraid of tying your cheerfulness to my sorrow; I feel that I am under a calamity, but I feel also that I am under no curse—you will help to make it a blessing. Oh, complete your sacred work; give me years to requite to you your last few days to me. You have none who need you more—none who love you more. Oh! follow me; here, on my child's grave, I humbly entreat you, follow me."

Catherine trembled; she stood silent a minute, and then, with a low, firm voice, replied, "Here, on your child's grave, I promise you. Your people shall be my people, and your God my God." She kept her promise, and never repented it.

From Punch.

MR. CAUDLE, HAVING COME HOME A LITTLE LATE, DECLARES THAT HENCEFORTH "HE WILL HAVE A KEY."

ON my word, Mr. Caudle, I think it a waste of time to come to bed at all now! The cocks will be crowing in a minute. Keeping people up till past twelve. Oh yes! you're thought a man of very fine feelings out of doors, I dare say! It's a pity you haven't a little feeling for those belonging to you at home. A nice hour to keep people out of their beds! *Why did I sit up then?* Because I chose to sit up—but that's my thanks. No, it's no use your talking, Caudle; I never will let the girl sit up for you, and there's an end. What do you say? *Why does she sit up with me then?* That's quite a different matter; you don't suppose I'm going to sit up alone, do you? What do you say? *What's the use of two sitting up?* That's my business. No, Caudle, it's no such thing. I don't sit up because I may have the pleasure of talking about it; and you're an ungrateful, unfeeling creature, to say so. I sit up because I choose it; and if you don't come home all the night long—and 't will soon come to that, I've no doubt—still, I'll never go to bed, so don't think it.

Oh, yes! the time runs away very pleasantly with you men at your clubs—selfish creatures! You can laugh and sing, and tell stories, and never think of the clock; never think there's such a person as a wife belonging to you. It's nothing to you that a poor woman's sitting up and telling the minutes, and seeing all sorts of things in the fire—and sometimes thinking that something dread-

ful has happened to you—more fool she to care a straw about you! This is all nothing. Oh no! when a woman's once married she's a slave—worse than a slave—and must bear it all!

And what you men can find to talk about I can't think! Instead of a man sitting every night at home with his wife, and going to bed at a Christian hour—going to a club, to meet a set of people who don't care a button for him, it's monstrous! What do you say? *You only go once a week?* That's nothing at all to do with it: you might as well go every night; and I dare say you will soon. But if you do you may get in as you can: I won't sit up for you, I can tell you.

My health's being destroyed night after night, and oh don't say it's only once a week; I tell you, that's nothing to do with it; if you had any eyes, you would see how ill I am; but you've no eyes for anybody belonging to you: oh no! your eyes are for people out of doors. It's very well for you to call me a foolish aggravating woman! I should like to see the woman who'd sit up for you as I do. *You didn't want me to sit up!* Yes, yes; that's your thanks—that's your gratitude: I'm to ruin my health and to be abused for it. Nice principles you've got at that club, Mr. Caudle!

But there's one comfort—one great comfort; it can't last long; I'm sinking—I feel it, though I never say anything about it—but I know my own feelings, and I say it can't last long. And then I should like to know who'll sit up for you! Then I should like to know how your second wife—what do you say? *You'll never be troubled with another?* Troubled, indeed! I never troubled you, Caudle. No; it's you who've troubled me; and you know it; though, like a foolish woman, I've borne it all, and never said a word about it. But it can't last—that's one blessing!

Oh, if a woman could only know what she'd have to suffer, before she was married—Don't tell me you want to go to sleep! if you want to go to sleep, you should come home at proper hours! It's time to get up, for what I know, now. Shouldn't wonder if you hear the milk in five minutes—there's the sparrows up already; yes, I say the sparrows; and, Caudle, you ought to blush to hear 'em. *You don't hear 'em?* Ha! you won't hear 'em, you mean: I hear 'em. No, Mr. Caudle, it isn't the wind whistling in the key-hole; I'm not quite foolish, though you may think so. I hope I know wind from a sparrow!

Ha, when I think what a man you were before we were married! But you're now another person—quite an altered creature. But I suppose you're all alike—I dare say, every poor woman's troubled and put upon, though I should hope not so much as I am. Indeed, I should hope not! Going and staying out, and—

What! *You'll have a key?* Will you? Not while I'm alive, Mr. Caudle. I'm not going to bed with the door upon the latch for you or the best man breathing. *You won't have a latch—you'll have a Chubb's lock?* Will you? I'll have no Chubb here, I can tell you. What do you say? *You'll have the lock put on to-morrow!* Well try it; that's all I say, Caudle, try it. I won't let you put me in a passion; but all I say is—try it.

A respectable thing, that, for a married man to carry about with him—a street door key! That tells a tale, I think. A nice thing for the father of a family! A key! What, to let your

self in and out when you please! To come in like a thief, in the middle of the night, instead of knocking at the door like a decent person! Oh, don't tell me that you only want to prevent me sitting up—if I choose to sit up, what's that to you? Some wives, indeed, would make a noise about sitting up, but *you've* no reason to complain—goodness knows!

Well, upon my word, I've lived to hear something. Carry the street-door key about with you! I've heard of such things with good-for-nothing bachelors, with nobody to care what became of 'em; but for a married man to leave his wife and children in a house with the door upon the latch—don't talk to me about Chubb; it's all the same—a great deal you must care for us. Yes, it's very well for you to say, that you only want the key for peace and quietness—what's it to you, if I like to sit up! You've no business to complain; it can't distress you. Now, it's no use your talking; all I say is this, Caudle: if you send a man to put on any lock here, I'll call in a policeman; as I'm your married wife, I will!

No, I think when a man comes to have the street-door key, the sooner he turns bachelor again the better. I'm sure, Caudle, I don't want to be any clog upon you. No, it's no use your telling me to hold my tongue, for I—what! I give you the head-ache, do I? No, I don't, Caudle: it's your club that gives you the head-ache: it's your smoke, and your—well! if ever I knew such a man in all my life! there's no saying a word to you! You go out, and treat yourself like an emperor—and come home at twelve at night, or any hour, for what I know—and then you threaten to have a key, and—and—and—

"I *did* get to sleep at last," says Caudle, "amidst the falling sentences of 'take children into a lodging'—'separate maintenance'—'won't be made a slave of'—and so forth."

WHERE ARE WE?

In 1829, the Roman Catholics of Ireland were admitted to Parliament, and made capable of holding high offices of state. In 1831, the reform bill made the representatives of the Roman Catholic electors a majority of the Irish members of parliament. In 1834, the Protestant Episcopal staff of Ireland was curtailed. In 1844, Roman Catholics were appointed members of the Board for superintending Charitable Bequests in Ireland; government sanctioned and encouraged Irish proprietors to provide permanent endowments by voluntary contributions for the erection of Roman Catholic chapels and the support of Roman Catholic priests; and three prelates of the Irish Roman Catholic Church were nominated commissioners, by their diocesan titles. In 1845, the annual parliamentary grant towards the support of the Roman Catholic clerical seminary of Maynooth is to be increased and made permanent.

This is the work of sixteen years. During that brief space, the Roman Catholics of Ireland have been placed on a footing of political equality with their Protestant fellow-subjects; and, as a matter of course, have been exerting themselves to place their church on a footing of equality with the Protestant Church—or churches. Towards this

end, a most important step has already been taken: the Roman Catholic Church in Ireland has had its existence as a partially-endowed church, with a theological university, and the ecclesiastical rank of its prelates, recognized. Such have been the beginnings of the endowment of the Roman Catholic Church in every country in Europe. The attempt to shut our eyes would be vain—the fact stares us in the face, that there are in Ireland two churches, unequal in point of revenue, but equal in political privilege—both recognized by the state as capable of holding, as deserving to possess, permanent endowments. Moreover, the state has practically asserted a right to pare down the emoluments of the one to some proportion with the number of its members, and to sanction if not directly to contribute to the augmentation of the emoluments of the other, on the same principle.

This change in the position of the Roman Catholic Church in Ireland has not been the consequence of underhand intrigues or illegal violence. It has been brought about by the legitimate exercise of political power, through the constitutional organs of government. It has been the inevitable consequence of the advance of the Roman Catholic body in Ireland in wealth and intelligence. The Roman Catholics were received within the pale of the constitution because it was felt that a real power (and such they were) can only work safely by being made part of the system exposed to its pressure. Once admitted within the pale of the constitution, they necessarily exercised their due proportion of influence. It is not to be expected that the majority of the Irish people will be satisfied to see their church treated with less respect than the church of the majority in England or Scotland.

It is well to contemplate the change in progress in its full extent; for sooner or later it will be necessary to do so. The religion of an individual is (or ought to be) the system of opinions he has conscientiously adopted after mature deliberation. But the ecclesiastical arrangements of a state necessarily depend upon the balance of political powers. It is not enough to demonstrate that any abstract form of civil or ecclesiastical government is "wisest, virtuousest, discreetest, best;" the political powers which are to give life and motion to its constitutional forms must preëxist. In framing your government, you must take into account the men who are to work it. *One* established privileged church is possible where dissentients from its doctrines and discipline are so few and poor as to possess no political influence; but where the dissentients are, though not equal in power, yet strong enough to defy compulsion, a compromise is inevitable. In this case, there are only two ways open to a government—either to patronize religion in the abstract by providing for the maintenance of all churches, (at least of all whose members possess political power;) or to leave every church to support itself. This is the great practical question that is now edging its way into public notice. When it is grasped in this its broad generality, opinion will array itself under the banners of two great parties; but till then, a succession of alliances for the day or hour, among men of the most discordant opinions, will provoke alternate laughter and disgust.—*Spectator, April 26.*

From Hood's Magazine.

MURDER WILL OUT.

TOWARDS the commencement of the present century, the Count Hector de Larolles, a Languedocian gentleman of ancient family, returned to Toulouse from the south of Italy, where he had been for some time resident, and took up his abode at his hotel in the Rue St. Marc. The count, who two years previously had left France as a widower, reëntered it as the husband of a young and beautiful woman, the daughter of a poor but honorable Neapolitan family. It was probably more her straitened circumstances, and the brilliant position offered her by a union with the count, than any very strong attachment to that nobleman, which had induced Donna Olivia to accept the hand of a man whose age tripled hers; and very shortly after their arrival at Toulouse, it became reported, among the more observant and scandal-loving portion of the society in which they mixed, that the count had already begun to taste the biters of an ill-assorted union. His wife was affirmed to show him marked coldness and repugnance, and there were also some malicious persons who did not scruple to say that Monsieur de Larolles had cause for jealousy in the attentions paid to the countess by an officer of the garrison who was a frequent visitor at his house. This was a Swiss, from the Italian canton of Tesino, who had entered the French army at an early age, and was now a major in the service. His reputation was that of a soldier of fortune, brave as steel, but tolerably unscrupulous; his person was strikingly handsome, his age about thirty years. A friend of the count's, with whom Major Ruoli was intimate, had introduced him at the Hotel Larolles, where he had gradually become a constant visitor. For a long time his attentions to the countess, and the evident willingness with which she received them, escaped the notice of the unsuspecting count, who, at last, however, had his attention directed to them by some more observant friend. A violent scene between Monsieur de Larolles and his wife was the consequence, and although the lady managed to exculpate herself to a certain extent, the result was that orders were given to the domestics not to admit Major Ruoli when he presented himself at the house. Ruoli called there repeatedly, but as, according to the statement of the porter, no one was ever at home, he at last seemed to take the hint as it was meant, and entirely ceased his visits.

This occurred towards the close of summer. About a month afterwards the Count de Larolles suddenly disappeared, and no tidings could be obtained of him. He had left his hotel at dusk one evening, and had never returned. The countess had gone out to call upon a friend, and the count, on leaving the house, had not, as was sometimes his habit, mentioned to his valet de chambre where he was going. No one had observed what direction he had taken, nor had he been anywhere seen. Inquiry and search were alike in vain. The count was not to be found.

Madame de Larolles was apparently in despair at this sudden disappearance of her husband. Messengers were despatched in every direction; friends, to whose houses he might possibly have betaken himself, were written to, pains and expense were lavished in order to discover him. For nearly two months the countess seemed to entertain hopes, and for nearly as long a time was the

public interest kept alive concerning this singular and mysterious disappearance; but then the affair began to be thought less of, the countess seemed disheartened by the fruitlessness of her search, and relaxed its activity, or it should rather be said nothing more remained to be done. The good people of Toulouse found something else to talk about, and before the new year arrived the occurrence seemed entirely forgotten.

The month of February commenced, and with it the Carnival, which passed with its customary gaiety and bustle. Towards its close there were, as usual, various processions and pageants, and at last came the closing day, the Mardi Gras upon which the old mummer Carnival was to play his final gambols before yielding up the field to Dame Carême and her austerities. According to custom, the peregrinations of the judges drew together a mob which was kept continually on the grin by the farcical trials that took place in this peripatetic *lit de justice*, and by the comical verdicts rendered by the wigged and black-robed judges. Laughter, however, although said to fatten, does not keep off the attacks of hunger, and towards the close of the afternoon, the car was turned into a court-yard, and judges, counsellors, and witnesses, repaired to a neighboring hotel to refresh themselves. Of the crowd that had been following, one portion dispersed through the adjacent streets, and another lingered about in groups, waiting the reëappearance of the pageant that had afforded them so much amusement.

This reëappearance took place much sooner than was expected. Less than half an hour had elapsed since the car had entered the stable-yard, when the gates were again thrown open, the vehicle drove out and turned down a neighboring street. There was a considerable change, however, in the manner in which it was occupied. The masked postilions were upon their horses, but no one appeared upon the car itself, which, instead of being occupied by the tribunal, desks, and other apparatus of a court of justice, was now covered over by an ample green cloth, with the exception of one end, where a kind of small canvass tent or pavilion had been erected. The curiosity of the spectators was strongly stimulated by this unusual change, and they eagerly followed the vehicle as it proceeded through various streets and finally entered the spacious Rue St. Marc.

Although only in the middle of March, spring had fully set in at Toulouse; the trees were bursting into leaf, and the air was mild and balmy. As the car passed by, people leaned out of their open windows and gazed at the huge machine that lumbered along and seemed to shake the very ground under its wheels. On arriving near the middle of the Rue St. Marc, the postilions pulled up their horses opposite a house of stately appearance, along the ample façade of which ran long ranges of deep balconies, composed of iron work fancifully designed and richly gilt, and overshadowed by festooned awnings of striped linen. The tall windows of the first floor were open, and from the opposite side of the street a glimpse might be obtained of the interior of a drawing-room, the inmates of which now approached the balcony, seemingly disposed to gratify their curiosity by a view of the car, at the same time that, to avoid the gaze of the throng, they kept themselves in some measure concealed behind the costly exotics that partially filled the balcony.

A minute or two elapsed without any change

taking place in the appearance of the car. The crowd remained in mute expectation. Suddenly, however, by some invisible hand or machinery, the green covering was rolled aside, and a sort of mimic stage appeared, on which was represented a river and its bank. The water, skilfully imitated by painted paper or linen, seemed to flow tranquilly along, while the bank itself was covered with artificial turf and flowers and backed by a low hedge of shrubs and brushwood. This hedge, which was composed of pasteboard, arose suddenly out of the cart, in the manner that such things are frequently managed upon a theatre, and at the same time there appeared a small stone chapel, containing an image of the virgin Mary, and surmounted by a cross. The effect of the whole representation was highly natural; and, to judge from the exclamations audible amongst the surrounding crowd, apparently recalled to their recollection some familiar scene. It was in fact a miniature but exact copy of a secluded and remarkably lovely spot on the banks of the Garonne, and at the distance of a short half-league from Toulouse. This part of the river-side had once been a resort of the towns-people, but a fatal and particularly savage duel, that had been fought there some years previously, and in memory of which the cross and chapel had been placed there, had attached unpleasant associations to it, and caused it, since that time, to be rather avoided than otherwise.

Scarcely had this scene been disclosed, when, from the small tent at one end of the cart, two actors appeared upon it. They were both masked, and one of them wore a blue military cloak and cap, while the other, a woman, was closely muffled in a dark silk cardinal, which nevertheless allowed the outline of a young and graceful figure to be distinguishable. At the slowest possible pace they walked along the bank of the simulated stream, apparently in earnest conversation, the female hanging familiarly on the arm of her companion, on whose face her eyes were riveted. Before they had proceeded half the length of the truly Thespian stage on which they were exhibiting, they were followed out of the tent by a third figure, who approached them with stealthy step. This was a man whose hair was silvered and form slightly bowed by age, and on beholding whom a movement of surprise took place in the crowd, while the name "Count de Larolles!" passed from mouth to mouth. At the same time a half-stifled shriek was heard proceeding from the balcony of the magnificent hotel opposite to which the pageant was enacting.

The old man upon the cart arrived close to the figures of the officer and the lady, without their observing him. He seemed to listen for a moment; then fiercely grasped an arm of each. In the dumb show that ensued, it was evident that a violent discussion was going on between these three persons. The old man seemed much agitated, and was the most violent in his gesticulations. Once he grasped the officer by the collar, but the latter disengaged himself, and he then seemed to turn his anger upon the lady. Then, and as if moved to sudden anger by something the old man said, the officer seized him in his turn. There was a struggle, but the antagonists were too unequally matched for it to be a long one, and in a moment the grey-haired old man was hurled backwards into the river. The fictitious waters opened to receive him. Once only he arose, and

seemed about to gain the bank, but the officer advanced closer to the water's edge, and, as the swimmer approached, drew his sword from under his cloak and dealt him a heavy blow upon the head. The next instant the old man disappeared, and the river flowed on, tranquil as before. The murderer and the lady gazed for an instant at the water, then at each other, and hurried off the stage. The postilions lashed their horses, and the car drove away at a smart pace. This time, however, none of the spectators followed it. The attention of all was rivetted on the house before which this scene had passed, and which was no other than the hotel Larolles.

On the balcony of that mansion a young and lovely woman now showed herself, uttering those thrilling and quick-repeated shrieks that, even in women, are only elicited by the most extreme agony of mind or body. She was attired in mourning garments, but of the most tasteful and coquetish materials and arrangement of which that description of apparel will admit, although her dress was now disordered by the violence with which she had pushed through the plants and thrown herself against the front of the balcony. Her beautiful features were convulsed and deadly pale, and she clutched the railing with both hands, while she struggled violently to extricate herself from the grasp of a very handsome man in a rich uniform, who strove by mingled force and entreaty to get her back in the house. The lady was the Countess de Larolles, the officer was Major Ruoli.

The broken sentences uttered, or rather screamed, by the countess, who was apparently in a paroxysm of insanity, were distinctly audible to the persons in the street. She accused herself as the murderer of her husband, and Ruoli as her accomplice. The latter at last succeeded in dragging her into the room, of which the windows were immediately shut. It was only then that some of the crowd thought of following the movable theatre upon which had been enacted the drama that had been followed by such an extraordinary scene of real life. Car and horses were found a short distance off, standing in a solitary corner behind a fragment of the old city wall; but the car was empty, and there was nobody with it. Even the postilions had disappeared.

That same evening Major Ruoli and the Countess de Larolles were arrested, by order of the authorities, on suspicion of the murder of the count. The countess was in a raging fever, unable to be moved, and for a long time her life was in danger; but on her recovery, she made a full avowal of the crime to which she had been an accessory. The truth of her confession, had there been any reason to doubt it, was confirmed by the discovery of the count's body, which had floated down into a solitary nook of the river, several hundred yards below the spot where he had lost his life, and had remained concealed amongst rushes and alder trees. His features were unrecognizable, but his dress and various other particulars were abundant evidence to prove his identity. His skull was indented by the blow of Ruoli's sabre.

Finally, Ruoli, was sent to the galleys, and the countess sentenced to imprisonment for a term of years. Fever and remorse, however, had played havoc with her constitution, and she died a few months afterwards.

Previously to the trial, which excited immense

interest at the time, and of which we are informed that a curious account is to be found in the French papers of the year 1802 or 1803, every effort was made, but in vain, to discover the deivers and actors of the masquerade which had led to the detection of this crime. It appears that the car had been left in the stable-yard by the postilions while they went to dine, and that, when they returned, it had already disappeared; all that remained of it, being the chairs, table, and other apparatus of the judges, which had been thrown out upon the ground. An ostler had seen several persons busied about the car, but, from their being in masquerading attire, had concluded they were some of the party to whom it belonged. It was suspected, but could not be proved, that this man had been bribed to see as little as possible.

No plausible conjecture could be formed as to the motives of the person who had become acquainted with the commission of the murder for not sooner, and in a more direct and open manner, bringing forward his evidence concerning it. Some supposed that having been a hidden eye-witness of the deed, he apprehended being himself liable to punishment for not having made an effort to prevent it; others supposed that he feared Major Ruoli, who was known to be violent and reckless; and a third conjecture was, that it was some person of indifferent character, who thought his unsupported testimony would not find credence when brought against people of rank and influence. Whatever the motives may have been, and although there were evidently at least five persons connected with the masquerade, the secret was well kept, and to this day the affair remains shrouded in mystery.

From Chambers' Journal.

ADVERTISEMENTS OF "THE TIMES."

In the whole range of periodical literature, there is no greater curiosity than the columns daily devoted to advertisements in the Times newspaper. From those ponderous pages the future historian will be able to glean ample and correct information relative to the social habits, wants, and peculiarities of this empire. How we travel, by land or sea—how we live, and move, and have our being—is fully set forth in the different announcements which appear in a single copy of that journal. The means of gratifying the most boundless desires, or the most fastidious taste, are placed within the knowledge of any one who chooses to consult its crowded columns. Should a man wish to make an excursion to any part of the globe between Cape Horn and the North Pole, to any port in India, to Australia, to Africa, or to China, he can, by the aid of one number of the Times, make his arrangements over his breakfast. In the first column he will find which "A. I. fine, fast-sailing, copper-bottomed" vessel is ready to take him to any of these distant ports. Or, should his travelling aspirations be of a less extended nature, he can inform himself of the names, size, horsepower, times of starting, and fares, of numberless steamers which ply within the limits of British seas. Whether, in short, he wishes to be conveyed five miles—from London to Greenwich—or three thousand—from Liverpool to New York—information equally conclusive is afforded him.

The head of the second, or sometimes the third column, is interesting to a more extensive range of readers—namely, to the curious; for it is gene-

rally devoted to what may be called the romance of advertising. The advertisements which appear in that place are mysterious as melodramas, and puzzling as rebuses. Some of them are worded after the following fashion:—

"TO CHARLES.—Be at the pastry-cook's at the corner of S— street, at two. Jemima is well—Alice."

Out of such an advertisement, a novelist of ordinary tact might construct a whole plot. "Charles" is a lover; the course of whose love has been crossed by some inquisitive papa or guardian; he has been forbidden the house of his adored Jemima. Correspondence by post is also impracticable; so the lovers advertise one another in the Times. Happily, the lady has a *confidante*, to whom is intrusted the advertising department of the affair. The above is an assignation concocted by her ingenuity, and signed with her name.

Perhaps a week after, another announcement in the same column will furnish the novelist with the catastrophe. It runs thus:—

"TO THE YOUNG LADY who was last seen at the pastry-cook's at the corner of S— street. You are implored to return home immediately, and all will be forgiven."

The fact is, Jemima met Charles punctually, and eloped with him from the bun-shop. Her father has relented; and as no further advertisements can be detected from the same parties, it is fair to infer that their little family differences have been made up; that Charles and Jemima are married, and are as happy as they deserve to be. Occasionally, however, we find this interesting column occupied with notices which force upon us more painful inferences. A young man has defrauded his employers, and absconded; and his parents invoke him, by the initials of his name, to disclose the amount of his defalcations. In other instances, a cowardly bankrupt has run away from his creditors, and left his wife to bear the brunt of their importunities. She implores him, through the Times, to return and help her through the difficulty.

Beneath such brief tales of mystery are usually advertised articles which have been lost or stolen. These vary in style, from the coarse and mercenary offer of "One sovereign reward," to the delicate hint that "If the lady who took the ermine cloak away by mistake from the Marchioness of Crampton's rout on Thursday evening will send the same to the owner, her own camlet wrapper will be returned to her." One of the most refined of this class actually appeared in its proper place a few months since. As a *superb* appeal to the susceptible sentiments of a couple of pickpockets, it has no equal in the history of advertising:—

"If the clever artists, male and female, who combined to relieve an elderly gentleman of his letter-case and purse on Friday evening last will return the former, with the papers it contained, they will oblige. The case and papers are of no use to them."

Succeeding the "Lost and Stolen," it is usual to find one or two of those heart-stirring appeals to the benevolent which—despite the efforts of the Mendicity Society—have maintained many an impostor in idleness for years together. Like Puff, in Sheridan's "Critic," these advertisers support themselves upon their (assumed) misfortunes, by means of the proceeds of addresses "to the chari-

table and humane," or "to those whom Providence has blessed with affluence." The account which Puff gives of his fictitious misfortunes so little exaggerates the advertisements which appear occasionally in the Times, that we quote it. "I suppose," he boasts, "never man went through such a series of calamities in the same space of time. I was five times made a bankrupt, and reduced from a state of affluence by a train of unavoidable misfortunes. Then, though a very industrious tradesman, I was twice burnt out, and lost my little all both times. I lived upon those fires a month. I soon after was confined by a most execrating disorder, and lost the use of my limbs. That told very well; for I had the case strongly attested, and went about to collect the subscriptions myself! Afterwards, I was a close prisoner in the Marshalsea for a debt benevolently contracted to serve a friend. I was then reduced to—oh no—then I became a widow with six helpless children. Well, at last, what with bankruptcies, fires, gout, dropsies, imprisonments, and other valuable calamities, having got together a pretty handsome sum, I determined to quit a business which had always gone rather against my conscience." The police reports testify that pathetic advertisements, equally unfounded, find their way into the third column of the Times, despite the utmost vigilance of the clerks. Some, on the other hand, are manifestly from objects worthy both of credit and of relief. Of the latter, we select one which appeared on the 7th of February, 1844, and which bears evident marks of genuineness. Addressing the sympathies of the benevolent by the borrowed aid of a popular fiction was a happy thought:—

TO THE BROTHERS CHERRYBLE, or any who have hearts like theirs. A clergyman, who will gladly communicate his name and address, desires to introduce the case of a gentleman, equal at least to Nickelby in birth, worthy, like him, for refinement of character, even of the best descent; like him, of spotless integrity, and powerfully beloved by friends who cannot help him, but no longer, like Nickleby, sustained by the warm buoyancy of youthful blood. The widowed father of young children, he has spent his all in the struggles of an unsuccessful but honorable business, and has now for eighteen months been vainly seeking some stipendiary employment. To all who have ever known him he can refer for commendation. Being well versed in accounts, though possessed of education, talents, and experience, which would render him invaluable as a private secretary, he would accept with gratitude even a clerk's stool and daily bread. Any communication addressed to the Rev. B. C., post-office, Cambridge, will procure full particulars, ample references, and the introduction of the party, who is now in town, and ignorant of this attempt to serve him."

The succeeding couple of columns in the first page of the Times usually display the multifarious "wants" which an endless variety of desiderators are anxious to get satisfied. Situations by far outnumber the other wants. A governess, a gardener, an editor, a schoolmaster, a tailor, a clerk, or a shopman, who is in want of employment, seeks it through the pages of the Times newspaper. The accomplished, intellectual, honest, moral, in short, "unexceptionable" characters, who thus paint their own portraits, give to the fourth and fifth column of the leading journal the semblance of a catalogue of spotless worthies.

Some, again, try to gain employment by ecen-

tric appeals. Foremost among these we place the annexed little autobiography from a person who advertised himself on the 22d of last February as

"A CHARACTER.—The noblemen and gentlemen of England are respectfully informed that the advertiser is a self-taught man—a 'genius.' He has travelled (chiefly on foot) through the United Kingdom of Great Britain and Ireland, in Holland, Germany, Switzerland, Belgium, France, and Italy. He has conducted a popular periodical, written a work of fiction in three vols., published a system of theology, composed a drama, studied Hamlet, been a political lecturer, a preacher, a village schoolmaster, a pawnbroker, a general shopkeeper; has been acquainted with more than one founder of a sect, and is now (he thanks Providence) in good health, spirits, and character, out of debt, and living in charity with all mankind. During the remainder of his life he thinks he would feel quite at home as secretary, amanuensis, or companion to any nobleman or gentleman who will engage a once erratic but now sedate being, whose chief delight consists in seeing and making those around him cheerful and happy. Address A. Z., at Mr. P——'s, B—— street, Regent's Park."

It would appear that the self-praise thus published sometimes requires a little help; hence, besides, "undoubted ability" and "unexceptionable references," a *douceur* is occasionally offered "to any one who will procure the advertiser a respectable situation." This "sweetener" we have known to vary from five to five thousand pounds, "according to the emoluments." Despite, however, all eccentricities, deception, and other evils, there can be no question that through the advertising columns of the Times many a servant has procured a good situation, and many a master has been indebted for a valuable servant. As a specimen of the appeals, the truth of which it is difficult to doubt, we print the following. The fickleness of fortune is strongly exemplified by the fact of a gentleman of "high rank" seeking the humblest employment:—

"It would be a noble act of humanity if any generous and kind-hearted individual would procure or grant employment to a suffering individual, in whose behalf this appeal is made. He is of high rank, education, and manners, and in every point of view fit to fill any situation. He is without influential friends, and, from complicated frauds and misfortunes, is unable to continue the education of eight lovely children. He seeks nothing for himself, except to be so placed, giving to the hands of his kind benefactor all he receives for his children's present and future support. This will save him from a broken heart. Any situation that will enable him to effect this object will be received with heartfelt gratitude, and filled with honor, assiduity, and fidelity. Most respectable reference, &c. N. B. No pecuniary assistance can be received."

The "want" which usually succeeds that for situations is common at some time or other of his life to every living being. The bottom of the fifth column of the Times generally contains some half-dozen announcements that X. Y. or A. B. wants money. In a modern comedy, one of the characters, with a view to borrowing, tells a rich friend "that he is terribly in want of a thousand pounds." The other, with a comprehensive experience of the world, replies, "I have no doubt of it; for you may take it as a rule that every man wants a thou-

sand pounds."* Of this vast multitude of mankind, there are, it appears, only a few superlatively sanguine individuals who hope to obtain the required cash by advertising. "Ample security" or usurious interest is generally the bait held forth to lenders; but we are able to produce one remarkable instance in which the advertiser expresses a wish for the loan of a bagatelle of four thousand pounds without security, and which he proposes to repay, not with interest, but with gratitude:—

"A MAN OF RANK, holding a distinguished public office, moving in the highest society, and with brilliant prospects, has been suddenly called upon to pay some thousands of pounds, owing to the default of a friend for whom he had become guarantee. As his present means are unequal to meet this demand, and he can offer no adequate security for a loan, the consequence must be ruin to himself and his family, unless some individual of wealth and munificence will step forward to avert this calamity, by applying £4000 to his rescue. For this he frankly avows that he can, in present circumstances, offer no other return than his gratitude. A personal interview, however painful, will be readily granted, in the confidence that the generosity of his benefactor will be the best guarantee for his delicate observance of secrecy. He hopes his distressing condition will protect him from the prying of heartless curiosity; and to prevent the approaches of money-lenders, he begs to repeat that he can give no security. Address to 'Anxious,' General Post-office, London." This "anxious" man of rank made known his trifling want in the *Times* of January, 1844.

The sixth and last column of the first page of the *Times* is invariably devoted to equestrian and vehicular advertisements. Any gentleman who may want a clever hack, a quiet cob, a powerful horse of splendid action, warranted to ride or drive; or any tradesman requiring a team of superior young cart-horses, has only to consult his newspaper.

Over leaf, on the second page of the *Times*, persons in want of "apartments" or lodgings, "with or without board," will find many places to choose from. Announcements of public companies which are of a more general interest come next. Amongst them sometimes appear singular effusions, chiefly consisting of the schemes of enthusiastic patriots and headlong politicians, who invent plans for setting everything to rights in this complicated community, as fast as the horses, announced for sale in a previous column, can gallop. One, which was published about twelve months since, we have carefully preserved. It is by a political regenerator who dates from Cheapside:—

"TO THE MINISTERS OF STATE, NOBILITY, AND COMMUNITY AT LARGE.—A remedy for the distresses of England.—Every considerate person admits the present condition of society to be perfectly anomalous. A remedy has at length been discovered—a remedy which would effectually arrest the progress of pauperism, confer incalculable benefits upon the industrial community, and diffuse joy and gladness throughout the length and breadth of the land, making England (without exaggeration) the envy of surrounding nations, and the admiration of the world. The plan possesses the peculiar merit of being practicable, and easy of application, without in the slightest degree infringing the rights of property as by law established, or in any way disturbing the present relations of society. The

* Bubbles of the Day, by Douglas Jerrold.

advertiser will communicate his discovery either to the ministers of state, nobility, or those who may take an interest in the wellbeing of society, on condition of his receiving (if his plans are approved, and made available for the purposes contemplated) £100,000. 'If the nation be saved, it is not to be saved by the ordinary operations of statesmanship.'—Lord Ashly." The modesty of the advertiser prevents him from adding in words what he evidently wishes the reader to conclude; namely, that the nation is only to be saved by E. S., of No. 142 Cheapside.

The rest of the columns of the *Times* usually occupied by advertisements are filled with announcements of new works, either just out, or in preparation; patent medicines, and sales by auction. One department is benevolently set aside for the insertion of short applications for places from domestic servants. These advertisements are received at a price which little more than covers the duty, and expense of composing.

Lastly come the rhetorical advertisements. These flow from the fervent pens of imaginative auctioneers, "who"—to quote Mr. Puff once more—"crowd their announcements with panegyric superlatives, each rising above the other, like the bidders in their own auction rooms;" inlaying "their phraseology with variegated chips of exotic metaphor." The skill with which their descriptions of houses or of lands magnify excellences and conceal defects without making an entire sacrifice of truth, is on some occasions wonderful. When a mansion is dilapidated, that is described as a lucky circumstance, for, "with a trifling outlay, the fortunate purchaser will be afforded a fine opportunity of exercising his taste in restoration, alteration, and decoration." Sometimes the auctioneer is "happy" to announce that a large portion of the estate now for sale is in a completely uncultivated state, so that the possessor will have a fine field for the introduction of those wonderful improvements in draining and agricultural chemistry which are now at his disposal. We must admit, however, that these wordy announcements are less frequent in the *Times* than in other newspapers, although the above expressions are copied from its pages. The truth is, the graces of rhetoric are not exempted from the high charges of that densely filled journal, but cost as much per line as the veriest cheesemonger's puff. Economy therefore obliges the verbose auctioneer to be sparing of adjectives, and to cut out his most exalted superlatives. It is only when the magnitude of the transaction enables him—*heureusement*—to puff off the property "regardless of expense," that he is able to take a high flight in a long advertisement.

We have now reviewed the various announcements which, taking the average, daily appear in the *Times* newspaper. By an orderly arrangement of the printer, the different kinds we have adverted to appear as nearly as possible in the portions of the vast sheet which we have described, so that a practised reader can tell, within a column or so, where to pitch upon the sort of announcement he may wish to peruse. No one possessed of a spice of philosophy can glance over those broad sheets, without extracting a deep meaning from the mass, and without getting a strong insight into human nature from many of the individual advertisements. Had the *Acta Diurna* of the Romans contained similar announcements, we should have learned more of their private life and habits from one of its numbers, than from all the classical works which have been handed down to us.

CORRESPONDENCE.

We are in the frequent receipt of letters and hints from persons who are dissatisfied with the distrustful and watchful course which we recommend as to the policy of the British government; and it has been repeated to us as the opinion of some readers, that our remarks are all on one side, having an unfriendly bearing towards England. It may be worth while to answer that opinion by an extract from the New York Evening Post of 27 May:

LITTELL'S LIVING AGE.—This weekly compend of the best articles of the foreign reviews and magazines, is for sale by Wm. Taylor, No. 2 Astor House. A correspondent requests us to "notice the number for the last week, for the purpose of protesting in behalf of the habitual readers of the work, against the remarks with which certain articles from British journals on the Oregon question are introduced. The person whose deeply responsible task it is to string these articles together in the order in which they are to be printed, has seen fit to censure the President of the United States for the passage in his inaugural address relative to our rights on the Pacific, and distinctly to commend the British Premier for his conduct in the same premises. Now the purchasers and readers of the Living Age have the right to expect that if its publisher must cherish sentiments favorable to the pretensions of the country's enemies, he will at least refrain from giving them expression in this work. The brief article to which we allude would be harmless enough in the corner of a Boston newspaper, but, appearing under the circumstances which it does, it is highly offensive."

We believe it an important part of our duty to show the state of public opinion in Europe, in regard to matters under discussion in this country; and intend to maintain the right to give a commentary of our own. Considering the enslaved state of so many of the party papers, which must praise or blame in concert, it is not too much to hope that even a weak voice, pitched in a different key, may be heard to some useful purpose. As to the charge of entertaining "sentiments favorable to the pretensions of the country's enemies," we would reply, that the principal subject of our remarks was a regret that our own claims should have been damaged by the President's inaugural discourse, in which he would appear to *our friends* in Europe decidedly in the wrong. By these friends we mean, not France alone, and much of Germany, but also and principally, the great body of the *English* nation as distinguished from its government. This powerful body of friends of Peace with all the world, and especially of Peace with the United States, ought not to be disgusted and irritated by an arrogant assumption of exclusive right in a matter which is under amicable discussion between the two nations. This is not the best way to succeed in the matter of controversy, and, as we said before, we do not think the President meant to be so understood *in Europe*. Since our brief notice was written there has been an arrival from Europe which shows that our anticipations were correct, and that as far as we can judge the French public think Great Britain more nearly in the right than we are.

We did not "distinctly commend" Sir Robert Peel for his conduct in reply. We stated that he had "ably, adroitly, and we must acknowledge fairly, made use of the opportunity to animadvert upon the unusual course of the President," and we lamented that he had the opportunity. We have not shown any unwillingness to think or speak well of the "powers that be." So far otherwise, that we made haste to enjoy in anticipation—to realize as it were—all the indications of a sound and energetic administration, which could be gathered in advance. We have even suffered our praise of the President for refusing to see, as such, a party association, to stand; although we found we were entirely in the wrong as to the fact.

In another part of this number will be found a pleasant and judicious article from the Examiner; and in that paper of 17 May is the following review of a French work, the author of which comes, most unaccountably, to a decision in favor of England to the whole:

Exploration du Territoire de l'Oregon, de Californie, et de la Mer Vermeille, exécutée pendant les années 1840, 1841, et 1842. Par M. Dufour de Mofras, Attaché à la Légation de France à Mexico. Two vols. Dulau.

This is an interesting and, in the present circumstances of the political world, not an unimportant work. M. de Mofras' expedition was undertaken, and the volumes narrating it are now published, by order of the French government. It appears that he had previously visited North America; and being attached to the French Embassy at Madrid, was selected by his government, owing we presume to his acquaintance with the Spanish language and the history of Spanish maritime enterprise, for the task of exploring the north-west coast of America. To this end he was attached to the French Legation in Mexico, whence, after due preparation, he proceeded on that survey of the immense regions lying between Mexico and the Columbia, and of the coasts as far as Behring's Straits, the narrative of which is now before us. The author observes that "his work commences where that of M. de Humboldt leaves off, and that his chief title to indulgence will be, that he has attempted to follow the traces and continue the work of that illustrious traveller."

To us, however, the most attractive portion of M. de Mofras' work is the chapter in which he discusses the rival claims of Great Britain and the United States to the Oregon territory. As to prior discovery, he asserts, and we believe with justice, that Spain alone can make out a title to the north-west coast of America on that ground. He argues also that New France, the rights and titles of which now devolve on Canada, was generally considered, in the early half of the last century, as extending to the Western Ocean. We are not sure however that he adduces any evidence on that point to which a jurist could attach much value. On the other hand, he is certainly very elaborate, if not entirely satisfactory and conclusive, in his examination of the treaties affecting the disputed rights, which have been severally executed by Great Britain and the United States with France, Spain, and Russia. And, without depart-

ing from opinions recently expressed in this journal, it seems to us to be at least very interesting evidence as to the merits of the question, when a Frenchman, who openly avows his hatred of England, who is a diplomatist also, well acquainted with and fully qualified to expound the various treaties and conventions severally relied on by the litigant parties, yet goes so far as to declare distinctly, that the Oregon territory rightfully belongs to Great Britain, and that, chicanery apart, the United States have not a shadow of title to it. He concludes his lucid discussion of the arguments on both sides with this emphatic avowal:

"If we must now pronounce an opinion on this important question, we cannot, in spite of our sympathies with the United States and our profound hatred of the ambitious policy of England, help acknowledging that in this instance justice and reason are on the side of the latter, and that England has an absolute and exclusive right to the possession of the disputed territory. This sentence will doubtless draw down upon us much violent criticism; yet it is the expression of sincere conviction, and the result, not so much of our exploration of the Oregon territory, as of the careful study and examination of the treaties, conventions, and documents of every kind which bear upon the question."

We have said that M. de Mofras is, like some others of his countrymen, extremely adverse to the "perfidy and ambition" of England. But in affirming the right of this country to the Oregon territory, he professes to yield to the dictation of an unequivocal and imperative sense of justice. Yet he finds it impossible to keep his eyes fixed long and steadily on so sober and dispassionate an object as abstract justice. He soon loses sight of it; forgets its language; and intimates his expectation that in this dispute, as in the case of the north-east boundary, American firmness will triumph over British pride. Our readers already know that we are indisposed to countenance any such hope, or to regard such a question as this of the Oregon, in the light of a "triumph" for either party.

THE NEW HOUSES OF PARLIAMENT.—In the year 1847, the New Houses of Parliament will be completed. Owing to the unsettled state of the iron trade, some delay has occurred in fixing the iron work of the roof, but a considerable portion is in readiness. The House of Lords is roofed in.

THE STATISTICS OF SOAP.—Mr. Hutt, with a laudable desire to ascertain how his county is off for soap, has moved for and obtained a parliamentary return embracing all the statistics of this very interesting subject. It seems that, in England, the quantity of soap manufactured is considerably larger than the quantity made in Scotland. Perhaps the increase in the manufacture in British soap may have arisen from a rumor that several of the old Tories intended to wash their hands of Peel; and as some of those hands have had a finger in matters not particularly nice, it was naturally thought that a great quantity of soap would be required for the operation alluded to.

We understand that Mr. Williams seconded Mr. Hutt's motion, on the ground that we ought to know how we stand for soap, when we may be called upon rather suddenly to lather the Americans.

From the Examiner.

SIR ROBERT PEEL'S ENCOURAGEMENT TO AGITATION.

SIR ROBERT PEEL has now explicitly avowed that the Maynooth grant has been extorted by the repeal agitation. He does not pretend that it is a concession prompted by justice or by kindness. He plainly confesses that it is wrong from the fears. "There is a cloud in the west," says he, "and we must make our peace with Ireland."

Is not this what Mr. O'Connell has been calculating on for the last three years! When urging on the repeal agitation, has he not assured his followers that whenever dangers threatened England, they would obtain all they wanted, that nothing was to be hoped from her justice or kindness, but everything from her fears, upon which they must work to attain their ends! And this view is now verified by Sir Robert Peel, who comes forward as the practical voucher for the truth of Mr. O'Connell's assertions, and confesses to the motives that have been averred to be the only ones for English concessions.

Upon the announcement of the Maynooth grant Mr. O'Connell remarked that it had preceded only by a day the defiance of America, and he drew the inference according with his standing argument, that the concession was made to prepare against foreign dangers.

Sir Robert Peel corroborates Mr. O'Connell's view, and connects his message of peace to Ireland with the declaration of the following night. Here is the passage—

"You must in some way or other break up that formidable (repeal) confederacy which exists against the British government and British connection. I do not believe you can break it up by force. I believe you can do much consistently with the principles which we avow with respect to the maintenance of the union and the maintenance of the Protestant church. You can do much to break it up by acting in a spirit of kindness, and forbearance, and generosity. I believe it is essential that you should break it up, in order that you may carry on the work of good government in Ireland, and in order that you may strengthen the connexion between the two countries, and the power and energy of this united kingdom. Sir, when I proposed this measure, I think it was on Thursday, the 3d of April—I proposed it, having given notice of it in the course of the last session of parliament, and without any the slightest reference to events which have since transpired; but on the day after I introduced the measure to the consideration of the house, our attention was called to a matter of great importance, and the noble lord (Lord J. Russell) felt it his duty partially to raise the veil which conceals the distant future. *There rises in the far western horizon a cloud, small indeed, but threatening future storms.* It became, my duty, on the part of the government, on that day, in temperate but significant language, to depart so far from the caution which is usually observed by a minister, as to declare publicly, that, while we were most anxious for the amicable adjustment of the differences—while we would leave nothing undone to effect that amicable adjustment, yet, if our rights were invaded, we were prepared and determined to maintain them. *I own to you, that when I was called upon to make that declaration, I did recollect with satisfaction and conso-*

lation that the day before I had sent a message of peace to Ireland."

Sir Robert Peel has thrown his cards on the table, he has shown his hand, and Mr. O'Connell is the greatest bungler that ever breathed if he does not now win the game.

If there had been no cloud in the west there would have been no anxiety to conciliate Ireland, and priests at Maynooth might have lived like pigs in a sty, without touching the shame or the compassion of Sir Robert Peel; but when a shadow of the danger of war appeared, the premier's fears dictated what his justice or good will never would have prompted. The argument then is, "We must be united, not because it is just and right to yield what may produce the blessings of union, but because foreign nations take advantage of the weakness attending our dissensions."

It is undoubtedly wise and politic to put an end to distractions inviting the encroachments and aggressions of foreign powers, but it is shameful that this should be avowed as the only motive for pacification, there being the incomparably superior one of the rights of our fellow-subjects, so long insolently slighted.

But it is only to support our claims to a wilderness on the Pacific that the premier consents to purchase the peace of Ireland.

Two bad lessons are to be derived from this concession; foreign powers learn that they have an interest in the dissensions of Ireland, which confessedly so enfeeble England that a distant shadow of danger makes her minister fain to have recourse even to the extreme and repugnant expedient of fair government; and, on the other hand, the repealers learn that they can obtain all they desire by taking advantage of foreign embarrassments.

Sir Robert Peel has in fact surrendered at discretion to Mr. O'Connell. On the grounds on which he has made the Maynooth grant there is nothing that he can refuse. He must grant whatever may be the imposed terms of union, not with any view to the fairness and fitness of the demands in themselves, but to the external perils attending the state of protracted discord. This may not be his meaning, but it will be the construction put on his speech, and the repeal agitation will proceed upon it in its exactions. The agitators have been taught to look for the success of their country's claims, not to their intrinsic justice or general expediency, but to the difficulties which may weigh upon England at the time, and if these do not happen to be present, they have only to wait for them and to persevere meanwhile in their confederacy. Clouds in the political horizon can never be very long wanting, and with the management which has been so plainly suggested they will bring their golden showers to Ireland, and having begun with Maynooth, they will one day rain mitres on the Catholic hierarchy.

Everything in concession, both reasonable and wild, may be expected from the motives proclaimed in Sir Robert Peel's speech of the 19th, which gives a complete victory to the repealers. Indeed, after this signal encouragement, we cannot see how any government can control or cope with the agitation.

We used to contend that a liberal ministry, by removing the just causes of discontent, would pale the fires of the agitation, but after the encouragement which Sir Robert Peel has given by his declaration, turning concession on the fears and

teaching the people to look to the difficulties of the yielders, not to the principles of equity and good government, which ought to be their guides, we must despair of pacification by moderate means—for moderate means can avail little when the most immoderate hopes and expectations have been encouraged. The question with the Irish leaders now is, not what they may fairly claim, but what may be wrung from England under the passing clouds that must occasionally threaten her peace.

Ireland was the peculiar difficulty of Sir Robert Peel's ministry, but he has contrived to make it as much the difficulty of any other administration; and after the signal encouragement he has given to agitation, if he should find himself unequal to the government, he will retire with the comfort of knowing that he has rendered the task as much beyond the strength of any other ministry, tory or liberal.

It was the general impression that the premier's speech of the 19th was the speech of a condemned man, a last dying speech without a confession. The parts were distributed, Sir James Graham doing the penitence, and Sir Robert the prostration suited to the last moments. Never was there a more abject performance.

There was, indeed, a wretched attempt at bravado in his safe challenge, "Punish us, but spare our measure," the only way of punishing him, as he well knows, being through the measure. As well might the convict on the drop say, "Punish me, but spare the precious rope; have mercy on the rope, don't subject it to the strain of my worthless body."

And yet the *Morning Chronicle*, in its newborn admiration of the premier, did not scruple to characterize the speech referred to as "a very able exposition," "enforced by arguments which must produce a deep impression;" and vouched for its "admirable tone!"

"Thank Heaven, we have a house of lords," the conservatives used to cry. Thank Heaven, we have a Macaulay to vindicate political morality, and boldly to say, "Thus didst thou" to the trickster, not accepting his present truckling as expiation of his former course of faction; the one being little less unprincipled and mischievous than the other. What a noble rebuke is this—

"What, let me ask you, is to be the end of a system of policy which yields nothing to reason and humanity, and which grants everything to agitation and threats? (Hear, hear.) Where will you, the government, stop short, if you are found thus constantly paltering with agitation. I defy you to say that the late government ever brought forward any measures with respect to Ireland which were not strictly conformable to their principles. You may, therefore, trust to our assertions when we tell you the point at which we will stop short in this career of concession. We promoted and supported you in carrying Catholic emancipation; we carried the reform of the municipal corporations, weakened as that measure was by your own opposition; we are now prepared to follow the same course with respect to Maynooth, even though we should sacrifice the confidence of our constituents by so doing. We think, and we now state publicly, that a repeal of the legislative union would be fatal to this great country, and we never will consent to it. Never, though we should be exposed to dangers as great as those

which impended when France, Spain, and Holland joined our American colonies in their war against us, while we were threatened at the same time by the armed neutrality of the Baltic powers—never, though another Bonaparte should pitch his camp at Boulogne—never, until all has been staked and lost, (loud cheers)—never, until the whole world has been convulsed by the last struggle of the great English people for their place among the nations. (Renewed cheers.) That is what we are prepared to follow: what we grant we will grant fairly, and what we resolve to withhold we will refuse with firmness. Then we should anticipate that our concessions would, as they have, be received with gratitude, as a proof of the equity of our conduct, and of the coincidence between our professions and our principles. But as it is, what the Irish people are refused by the present government excites their hatred, whilst every concession made in the spirit with which it is proffered by the right hon. baronet is received with contempt. Many months will not, I foresee, elapse, before the same machinery which has extorted this concession in favor of Maynooth will be again called into action; and it requires no very great exercise of foresight to predict that if the present government should be in power five years hence, the right hon. gentleman, the first lord of the treasury, will come down to this house and propose the final settlement of the Irish church, and entreat us to abandon our opposition on those terms. My belief is, that the right hon. baronet will be prepared to bring down a bill framed in the spirit of the proposition of my hon. friend the member for Sheffield; that bill will meet with the opposition of many of the right hon. baronet's habitual supporters; he will be dragged through by the assistance which he will derive from this side of the house, and though there may be some more earnest and more scrupulous man holding office under him, who would rather consent to sacrifice office than vote against his honest conviction, (loud cheers,) still I think I may very safely predict that there will be no difficulty whatever in finding a successor. (Loud cheers and laughter.) And should the right hon. baronet be taunted with a want of consistency and honor, he will reply by alleging the pressing circumstances that will compel us to assent to his measure, and will implore us in moving terms to assent to it, whilst a chancellor of the exchequer will be found prepared to quote my speech, and to prove that the reproach of inconsistency did not become my mouth. I think it right to speak in terms of strong reprehension with respect to a system of giving in a moment of danger that which was refused during a time of peace. I was always in favor of making fair and equitable concessions to the demands—the righteous demands, of the Irish people; and if to-morrow I were to hear that the Association for the Repeal of the Union was dissolved, and the concurrent mail brought intelligence of the complete reestablishment of our peaceful relations with America, I should neither be for giving less nor for granting more than I should be if Ireland were on the eve of a revolution—if a war was raging along the whole frontier of Canada—or if there were thirty sail of the enemy's line stationed in St. George's Channel. I shall vote with my honorable friend, for his proposition ought to have been granted long ago. I recommend to the right hon. baronet not to refuse it, although I fear if it is refused now it will

be granted—it will surely be granted hereafter, and when it is to be apprehended it will be too late—when, as your other concessions have done, instead of soothing, it will promote agitation—when, as all your other concessions have done, it will be manifest to all the world that it is not an act of justice or of humanity, but an avowal of weakness; and when it may be doubted whether the Irish nation will have been more injured by your long refusal or by your constrained concession of it.”

Upon this Lord John Russell (between whose reception of the ministerial measure and that of his colleague invidious comparison had been drawn) impressively remarked—

“I will not enter upon that party question upon which my right hon. friend the member for Edinburgh spoke the other night; but, if I do not do that, it is not from any disagreement at the sentiments expressed by him. To all that he said that night and this I agree. Whether or not there will be any future discussion upon that subject I know not, but if there should be I shall think it my duty to contrast the conduct of hon. gentlemen opposite from 1836 to 1841, and their conduct from 1841 to 1843, with that which they are at present pursuing; and I do come to this conclusion, that either there was the greatest blindness, the greatest want of foresight from 1835 to 1843, and in that case I can have no opinion of their wisdom, and must suppose that the ministers are the most wanting in capacity of any that have ruled this country for a long time; or, if I refuse that conclusion, and say they are men of great ability and capacity, I must deny that they acted with any sincerity during the whole course of their opposition. (Hear.)”

Sir Robert Peel now pretends that the Oregon dispute had nothing to do with the Maynooth concession, though he had taken such pains to connect the one with the other in his speech of the 19th. “But remember,” says he, “that I gave notice of this measure last August.” True, but did not this very bone of contention then lie in prospect before him; and besides that, was there not at that time the much greater danger of a rupture with France? He may shuffle and equivocate now to the best of his powers of quibbling, but the truth has escaped him (and, seldom as it does escape him, the public must make the most of it when they get it,) that his concessions are made not to justice, but wrung from his fears.

The *Chronicle* observes, that the virtue of the Maynooth grant has been marred by the display of bigotry against it in England, which has exasperated national prejudices, before too strong. Undeniably the exhibition is a very offensive one, but it is not the intolerance of England which has made Mr. O’Connell turn back to the Repeal agitation with renewed spirit and confidence, and which has caused him to forbid the queen’s visit under certain pains and penalties—the speeches of Mr. Macaulay and Sir James Graham are the avowed causes for his renewal of the war. The truth is, that the grant was but a nine day’s wonder, a surprise, and an agreeable one for the moment; but the novelty gone, the thing is valued at its worth, and what is granted is compared with what is withheld, and discontent resumes its natural and, we will add, its just sway. Most unwarrantably, however, were the repealers strengthened and emboldened by Sir

Robert Peel’s speech of the 19th, offering all up to agitation, coöperating with external difficulties, asserting no motive of justice for what might be conceded, and reserving no principle against any surrender, however wild and ruinous.

With this management the Maynooth grant has not been as oil on the troubled waters, but as oil on the flame, and the fires of the agitation, before smouldering, burn with redoubled fierceness.

For the peace of Ireland the thing is now not merely futile, the motives avowed for it are stimulants to mischiefs incalculable. In Ireland they embolden and invigorate the repeal agitation, while in Great Britain the grant rouses and exasperates intolerance. The two worst spirits in the two divisions of the kingdom are inflamed by this unlucky measure, the most ill-managed if not the most ill-advised.

Yet it must not be rejected. The mischief has been already done in Sir Robert Peel’s speech in support of it, and that cannot be recalled, and throwing out the bill would only infuriate Ireland; for though its value is now not great in her sight, for a straw so refused the quarrel of national pride and religion combined would be one of the most rancorous nature. Carried, it will bring no peace to Ireland, and leave a festering place in this country, which will trouble it for many years to come. How many of our best men are embroiled with their constituencies, and have their seats endangered by their votes on this question, and by what an order of minds are they likely to be superseded. That Maynooth may have more gentlemanly students, England and Scotland will have inferior, narrow-minded representatives, and the repeal agitation the most brilliant encouragement.

Of all the modes of conciliating Ireland Sir Robert Peel has taken the worst, the most transitory in its appeasing effects, with the greatest amount of exasperation on this side of St. George’s Channel. The repeal cause is the only one that profits by it, and owes it lasting gratitude. As a tribute to it, the surrender, as explained by the minister, is of incalculable value.

From the Examiner.

THE JESUITS IN SWITZERLAND.

SCHLOSSER, the able historian of the eighteenth century, classes throughout his work Protestant and Catholic Jesuits together, and will not allow that order, which he seems to think founded in nature, to be confined to one creed. All ecclesiastics, struggling for domination, under the pretence of being exclusively pious, and seeking to monopolize the conscience of the old, the education of the young, the confidence of statesmen, and the influence of aristocracy, he sets down as Jesuits; all such acting instinctively in the spirit of a corporation, even when the fraternity has not been formally instituted as one. The Heidelberg historian plainly says, that Germany has suffered as much from the insidious intolerance of the Lutheran Jesuits as from the greediness of the Catholic order; and it is evident that if the worthy professor had to write the religious history of Ireland, he would set down the General of the Jesuits and the Grand Master of the Orangemen precisely in the same category.

We give this German view of the Jesuits as a preface to some remarks on the civil war which

has broken out and abruptly terminated in Switzerland. A most ignorant, retrograde, despotic, and unconstitutional party got possession of power in the canton of Lucerne, suspended every liberty, gagged the press, thrust every independent man into prison, and frightened away the rest. In short, they acted at Lucerne almost the same part that Narvaez acted at Madrid; and moreover, they handed over the university to half a dozen Jesuits. The Liberal exiles of Lucerne were, like those of Spain, anxious to return to their country, and to regain their positions. They could only do that by the same means which had expelled them, viz., violence; and for the purpose they appealed to the sympathies of the Liberals in other cantons. In doing this they did not, of course, refrain from pointing out one of the most odious acts of their foes, viz., the installation of the Jesuits. This procured to them many adherents. But it is wrong to suppose that it was merely a religious quarrel, or that it was a Protestant onslaught upon Catholics. It was a liberal movement against a despotic and retrograde one; and English writers should have no reason for rejoicing in the triumph of the latter. Many of the leaders slain or captured in the attack were Catholics, liberal Catholics, but politically opposed to the Jesuits as much as any Protestant.

In illustration of the theory of Schlosser, we may observe, that an ultra-Protestant party reigned at Zurich, a neighboring canton, being at the moment the *Vorort* or Executive Government of the Confederation. It was for this government to have called forth the federal troops, intervened, and prevented bloodshed. Had it occupied Lucerne, or been posted near it, the mutually exasperated parties of the town of Lucerne could not have marched to mutual slaughter. But Protestant Zurich, dreading the Liberals; or the Radicals, as much as Catholic Lucerne, took no precaution, and allowed the rash young men to march to destruction. The outcry against the Zurich Ultras has been so great in consequence, that the executive has been obliged to resign, and the government of the federation has thus passed into more liberal and humane hands, which are now making exertions, directly by themselves, and indirectly through the diet, to stay the hand of the Lucerne executioners, who menace to follow up their triumph in the field by shedding blood upon the scaffold.

It is not only in Switzerland that the name and society of the Jesuits occupy the front of the stage. The novel of Eugene Sue, written against them, had excited to them much attention and against them much obloquy. It has had a very singular result in directing the attention of a band of robbers to the hidden wealth of the Order. The consequence has been, that the chief establishment of the Jesuits in Paris has been broken into, and sums and bonds, and papers of very great value, were carried off. The robbers have been indicted and brought to condign punishment, but the trial has revealed to the curious eyes of the Parisians that much of Eugene Sue's fable is actual fact; for the wealth of the reverend fathers has been incontestably proved, and not only the wealth, but the active means employed for augmenting this wealth, not merely by the aims of the faithful, but by the more worldly mode of speculations in railroads, stocks, and commercial enterprises. There are few places of influence in which the Jesuits may not have been formerly found, but this is the first time the reverend gentlemen had been surprised upon 'Change.

From the *Examiner*.

The Bokhara Victims. By CAPTAIN GROVER, Unatt. F. R. S. Chapman and Hall.

CAPTAIN GROVER, in dedicating this volume to the queen, says he hopes it will turn her attention to the cruel sufferings and alleged murder of two British officers, sent on an important diplomatic mission on her service, and abandoned by her government. He adds that Colonel Stoddart and Captain Conolly are not the only officers who have been sent to Central Asia, and left without further interference to their fate.

We fear that little doubt remains of the deaths of those gallant and enterprising men. But Captain Grover is unconvinced; and the reader will find his doubts and reasons worth looking at. We spoke highly of his former publication, and the present volume is much more deserving of praise. It is really extremely interesting. It presents a number of facts connected with the mission of Stoddart, his first imprisonment and subsequent desertion, which have not been known till now, and could not have been told more vividly. It contains lively illustrations of Eastern usage, which government functionaries in communication with the East would find themselves the better for knowing. It recounts clearly and unaffectedly his own exertions and sacrifices, and his recent journey to Russia. And it exposes, with straightforward simplicity, the trickeries and dishonesties of the foreign office.

Certainly the conduct of that office, through the whole of this Stoddart and Conolly business, is the sublime of shabbiness. It is the system, we suppose. It is to be hoped that Lord Aberdeen is as heartily ashamed of it as any man, in his unofficial character. Here is a mission sent out, chiefly at Captain Grover's expense, after men in the service of government. Government says it must cost it nothing. Government goes further and says, it must have a guarantee that any expenses the missionary finds needful for his safety, and which the diplomatic service may be bound to defray on the spot, shall be repaid to it. Captain Grover gives the guarantee; what had been anticipated takes place; and he is called at a month's notice to pay 400*l*. It is obvious, says Lord Aberdeen, that "her Majesty's government cannot consistently or properly charge the public with this sum." Captain Grover pays it. He then writes two letters to the foreign office, which give Lord Aberdeen so much uneasiness, that he sends for the captain and tells him the money (it was lately so inconsistent and improper for the public to pay) shall be paid back (out of the purse of the public) if he will withdraw those letters. We are sure we do not overrate Lord Aberdeen's sense of honor, when we suppose him ashamed of a system made up of such meanness and trickery.

Captain Grover brings forward the case of Lieutenant Wyburd as a pendant to those of Stoddart and Conolly. It is a curious case, and leaves little doubt of a precisely similar sacrifice. The captain, with good effect, contrasts this abandonment of men engaged in diplomatic service, with the conduct of the French government in the instance of *La Perouse*.

We quote Doctor Wolff's interview with the Bokhara Shakhawl (Secretary of State for Foreign Affairs) on which Captain Grover founds his doubt of the fate of Stoddart and Conolly. It is from the doctor's unpublished journals.

"SHAKHAWL. 'What is your name and request?'

"MYSELF. 'Joseph Wolff is my name, a moolah and dervish from England, who was in the city of Bokhara twelve years ago' (Moollah Hajee recollected this, and said so,) 'when I was well treated by his majesty, and a passport was given to me previous to my departure, which stated that the high order had been issued that Joseph Wolff be allowed to return to his country, and that on the road no one should lay any hindrance in his way. After me, Sir Alexander Burnes arrived, was well treated, and allowed to proceed on his way to England; and the hospitable conduct of his majesty towards myself and Sir Alexander Burnes induced others to visit Bokhara. Both the officers, highly beloved and honored by the British government, my friends, Colonel Stoddart and Captain Conolly, came here. Captain Conolly was my murreed, (spiritual disciple,) when suddenly it was reported from the land of Russia, the land of Khiva, &c., that both these officers, brave in war, and possessing religion, had been killed by order of the King of Bokhara; and this news made not only a great sensation throughout England and Hindostan; but also in America; and Mahomed Ali of Egypt heard of it; and thousands in England exclaimed, "War with Bokhara!"' (Here I was interrupted by the Shakhawl, who asked me, 'How far is England from Bokhara?' I replied that England was only three months from Bokhara; but that we had troops at Shikarpore, near Candahar, which is only thirty days distant.) I then continued saying, 'I, Joseph Wolff, seeing this great commotion throughout the world about the reported death of Colonel Stoddart and Captain Conolly, I printed in the newspapers: "Oh, my English friends, I cannot believe the report of the death of Colonel Stoddart and Captain Conolly, for at Bokhara they revere guests very much. I will, therefore, go and ascertain the truth!" My friends said, "Don't go, for they will kill you also." I replied, "Go I will, for Captain Conolly was my great friend." On seeing my determination, my friends induced the government of England to order their ambassadors at Constantinople and Teheran to procure me letters to his majesty the King of Bokhara, from the sultan, and from Mahomed Shah. On my arrival at Constantinople the sultan gave me the required letters, also the Sheik ul Islam of Stamboul, and Mahomed Shah, not only gave me letters for the King of Bokhara, but also for the Asoof-ood-Dowlah, ordering him to give me every assistance and aid, in order that I might obtain a good reception at Bokhara.'

"SHAKHAWL. 'What is, therefore, now your object?'

"MYSELF. 'My object is to ask, *Where are my friends, Colonel Stoddart and Captain Conolly? Are they alive or dead?* If alive, I beg his majesty to send them with me back to England; if dead, I beg his majesty to state the cause.'

"SHAKHAWL. 'Has the British government itself authorized you to come here?'

"MYSELF. 'No, I am sent by the sultan and Mahomed Shah on account of their friendship with England.'

"SHAKHAWL. 'Are you authorized to claim them if alive?'

"MYSELF. 'Yes, by all the powers of Europe, and the voice of the British nation.'

"SHAKHAWL. 'Is there much commotion about it in England?'

"MYSELF. 'Very much.'

"We were then dismissed."

Captain Grover thinks that if the officers had been put to death, the secretary of state would not have asked Dr. Wolff if he were authorized to claim our envoys if alive. But has he reason to place much reliance, either way, upon secretaries of state for foreign affairs? Nevertheless, upon this, upon other accounts he has received from Doctor Wolff, and on conversation he heard at St. Petersburg, Captain Grover thinks it more than probable that Stoddart and Conolly are still alive at Samarcand.

From the Examiner.

THE OREGON QUESTION.

WE do not recollect a speech which has given us more pleasure than that by Lord Aberdeen, of the 4th of April, on the Oregon question. It shows that our foreign relations are confided to a man who has the wisdom to detect and the courage to despise the vanity and want of real pride, which at present, much more than ambition or rapacity, lead nations to become instruments of mutual destruction. We congratulate the country that our minister prefers justice, moderation, and common sense to obstinacy or magniloquence, and "keeping up a high tone." Six months more of the "high tone" might have occasioned events which would have thrown back the civilization of Europe for a century. At the same time we do not agree with him, if it be, which probably it is not, his meaning, that the maintenance of national honor is the only legitimate ground of war. Cases may be supposed of a benefit to be obtained, or an evil to be averted, so great as to be worth the certain calamities and even the risks of war, though peace might have been honorably preserved. This, however, is not one of them. The Oregon territory is really valueless to England and to America. The only use of it to England is as a hunting-ground, which enables the Hudson's Bay Company to keep up its monopoly against the English people: a monopoly which occasions many species of furs to be twice and sometimes three times as dear in London as in Leipsic. The only use of it to America would be to make it an addition to territories already far too large for good government or even for civilization. The emigrants to Oregon must pass through thousands of miles of unoccupied land, with a soil and a climate far better than they will find on the shores of the Pacific. And when they get there, what will be the social state of a few thousand families, scattered through a territory more than six times as large as England, and three thousand miles from the seat of government? They will mix with the Indians, and sink into a degraded race of half-caste barbarians. If she could obtain sovereignty over the whole of the lands west of the Rocky Mountains to-morrow, every wise American statesman must wish that the next day they should sink into the sea.

The only real point in dispute, therefore, is a point of honor; the only real question is, what is the *maximum* which either party can concede, or, which is the same, the *minimum* which either party can honorably accept.

The Oregon territory extends in length from latitude 42; the Mexican boundary to 54.40; the Russian, being a distance of about 760 miles, and in breadth from the sea to the Rocky Mountains an average distance of 500 miles. So that its

whole contents are about 360,000 square miles, being more than three times as large as Great Britain and Ireland put together. From the Rocky Mountains eastward, for more than 1,000 miles, the 49th parallel of latitude divides the English possessions from those of the United States. So that the Oregon district above 49 is contiguous to the English territory, and below 49 to the American. The climate is warmer than that of the eastern coast, but colder than that of corresponding European latitudes, the lower portion resembling that of England, the higher that of Scotland. South of the Straits of St. Juan de Fuca, in lat. 48, there are no tolerable harbors; the only places of shelter are Port Bulfinch and the Columbia, but both are bar harbors, at all times dangerous, and for the greater part of the year inaccessible. Above that strait, and communicating with it, the harbors are numerous and excellent, in consequence of the many large islands projected before the coast. The soil is generally mountainous, rocky, and uncultivable, though there are some fertile alluvial bottoms. Of that portion which is south of the Straits of Fuca, not more than one eighth or one tenth is supposed to be reclaimable; and to the north of them the cultivable proportion is still less.

The very doubtful advantage of governing this barren region is claimed on four distinct grounds. 1. Discovery. 2. Contiguity. 3. Cession. 4. Settlement. We will take them as far as we can separately. First, as to Discovery. It may have been seen by Drake in 1580. One narrative of his voyage says that he reached lat. 48, the other that he did not ascend beyond 43. But as no use was attempted to be made of this supposed discovery, it has been very properly abandoned as a source of title. In 1592, Iuan de Fuca, a Greek in the Spanish service, is supposed to have discovered the strait which is called after him. In 1774, Iuan Perez was dispatched on a voyage of discovery by the Spanish government. He reached the 54th latitude, and is supposed to have first seen Queen Charlotte's Island and Nootka Sound, in lat. 49.45. In the next year Herceeta, also sent by the Spanish government, sailed along the whole coast, reached Vancouver's Island, and saw the mouth of the Columbia, which he named the River St. Roque. In 1778 Captain Cooke explored the coast between lat. 79 and Nootka Sound. In 1788 and the three following years, Captain Gray, in the American ship the *Columbia*, passed and repassed along the whole coast up to Nootka Sound, and first entered and named Bulfinch Harbor and the Columbia River. In 1792 and the three following years, Vancouver, under the orders of the British government, surveyed the coast, and one of his officers rowed up the Columbia about one hundred miles, that is, nearly to the point at which its rapids render it unnavigable. This completes the history of the maritime discoveries.

The progress of discovery overland was much slower. In 1805 Lewis and Clarke, sent by the American government, first crossed the Rocky Mountains towards the south, embarked on one of the tributaries of the Columbia, were carried down by the stream, and on the 15th November, 1805, reached its mouth. In the same year, or in the following year, some servants of the Hudson's Bay Company first crossed the Rocky Mountains towards the north, and discovered one of the northern branches of the Columbia.

On the whole, the title to the coast by *discovery*

seems to belong to Spain. Her government vessels were certainly the first who surveyed it, perhaps the first who saw it. The first who navigated the Columbia were Americans, Gray ascending it and Lewis and Clarke descending. We attach, however, little importance to the American discoveries. The title, such as it may be, which a nation acquires by the discovery of a line of coast, is not interfered with by a subsequent and more accurate survey by another nation of the rivers which intersect it.

We now come to the titles by *contiguity* and *cession*. Originally the title by *contiguity* belonged solely to France and to Spain; France having a claim to extend westward from Canada and Louisiana, and Spain to advance northward from California. In 1763 France ceded Canada to England, and thus transferred to us her claim to advance westwards towards the Pacific. In 1763 she ceded Louisiana to Spain, which gave to Spain a double claim by *contiguity* as far as the northwestern point of Louisiana. In 1781 the Russians began to occupy the north-west coast between lat. 56 and the arctic circle, and a third title by *contiguity* arose, Russia claiming a right to advance towards the south. In 1788 the first act of sovereignty was performed: it was performed by Spain and nearly produced a war. Some English or Portuguese merchants chartered two vessels, sailing under the Portuguese flag, but virtually commanded by an Englishman named Meares. He proceeded to Nootka Sound, erected a house there, and made a sort of yard, where he built a small vessel. The Viceroy of Mexico dispatched an armed force, which seized Meares' ships and broke up his establishment. Spain then demanded the punishment of Meares for intruding on Spanish territory. England denied the territory to be Spanish, and on her own part required reparation. Both nations armed, but a war was prevented by the Treaty of the 28th October, 1790, called the Nootka Sound Convention. By article 1 of that treaty the buildings and tracts of land on the north-west coast of America, of which British subjects had been dispossessed, were to be restored.

Article 3 stipulates that the respective subjects of England and Spain shall not be disturbed in landing on the coasts of the Pacific, in places not already occupied, for the purpose of commerce or of making settlements there.

By article 4 British subjects are not to navigate or fish within ten sea leagues from any part of the coast already occupied by Spain.

By article 5, in all places to the north of the coast already occupied by Spain, wherever the subjects of either nation shall hereafter make settlements, the subjects of the other shall have free access.

The northernmost point then occupied by Spain was Port San Francisco, in lat. 38. Next year, Capt. Vancouver was sent by the English government with instructions to receive the surrender of Nootka Sound and to explore the north-west coast. On his way out Vancouver committed one of the most remarkable pieces of maritime diplomacy on record. He took exclusive possession, in the name of the King of England, of the whole territory from lat. 39.20 to the Straits of St. Juan de Fuca, in 48. That is to say, the treaty having stipulated that the whole coast north of the Spanish possessions should be open to the settlement of the subjects of both nations, he quietly seized, in the name of the King of England, more than

two thirds of the habitable part of it. It does not appear that any attempt was ever made to act on this absurd assumption of sovereignty. A large portion of the territory comprehended by it, that between 39.30 and 42, is now under the undisturbed sovereignty of Mexico. In 1800 Spain restored Louisiana to France, and in 1803 France ceded it to the United States. This gave, for the first time, to the United States a claim by contiguity to the portion of the Oregon territory which lies to the west of Louisiana, subject, however, to the Spanish claim to advance north in respect to California, and to the Russian claim to proceed south, and also subject to the provisions of the Nootka Sound Convention.

In 1805 or 1806 the Rocky Mountains were, as we have already stated, first crossed by the servants of the Hudson's Bay Company on the north, and by Lewis and Clarke on the south.

The Hudson's Bay Company soon afterwards established some hunting posts on the west of those mountains. The Americans made little use of this new field until 1811, when Astor founded the small settlement to which he gave the name of Astoria, near the mouth of the Columbia. During the war of 1813 Astoria was taken by England. In pursuance of the first article of the treaty of 1814, it was restored to persons sent by the American government to receive it. The English flag was struck, and the American flag hoisted.

It now became necessary to make some arrangement between America and England. As neither party had any exclusive claim against Russia or Spain, perhaps the best plan was that which was adopted, namely, to copy the Nootka Sound Convention, and agree, "that any country which may be claimed by either party, westward of the Rocky Mountains, shall for ten years be open to the citizens and subjects of both powers; this agreement not to prejudice the claim of either party, or of any other state." This was the Convention of 1818. In 1819, by the Florida treaty, the 42nd parallel was admitted by the United States to be the Spanish frontier, and *Spain ceded to the United States all her rights, claims, and pretensions to any territories north of that line.* From that time the United States had three titles. First, Their own by contiguity; secondly, that of Spain by contiguity; and thirdly, that of Spain by discovery; the two Spanish titles being, however, subject to the Nootka Sound Convention. In 1824 Russia put in her claim. By an imperial ukase she declared the whole north-west of America, above the 51st parallel, to be part of the Russian territory. Against this England and the United States protested, and, after a fruitless attempt at joint negotiation, each treated separately with Russia. By the American treaty of the 17th of April, 1824, it was stipulated that the United States should form no settlements north of 54.40, and Russia none south of that line. By the English treaty of the 28th of February, 1825, a line beginning in 54.40, and then running in a north-western and northern direction, was declared to be the boundary between the Russian and the British possessions.

The claimants of the territory between the Russian and Spanish boundary were now reduced to two, England and the United States, and in 1826, as the convention of 1818 was near its expiration, an attempt was made to effect a final partition. Both parties agreed that the boundary line should start at the 49th parallel, but England required that as soon as the line struck the north-easternmost

branch of the Columbia that river should form the boundary. America required that the 49th parallel should continue the boundary. England afterwards agreed to surrender the peninsula north of the Columbia, formed by Admiralty inlet. This was refused, and the negotiation ended by an indefinite prolongation of the convention of 1818, each party being at liberty to annul it by a year's notice.

We now come to the last source of title, *settlement.* America in this respect has done little. The settlement at Astoria was abandoned soon after it was restored, and is now occupied as a post by the Hudson's Bay Company. From 1,000 to 1,500 Americans are said to be now settled on the Willimit, one of the southern tributaries of the Columbia. And this, we believe, is all. Nor has England done much more. The exclusive right of trading with the Indians in the country has been granted by the crown to the Hudson's Bay Company; but the grant contains no power to acquire, and still less to give a title to lands. It contains a proviso that nothing therein contained shall prevent the crown from establishing a colony, or annexing any part of the territory to any of our North American colonies. But nothing of the kind has been done, and it does not appear to us that any British subject has a title to a foot of land within the territory. The Hudson's Bay Company have indeed posts in many parts of it; a few to the south and many to the north of the Columbia, but under their charter they have no right to these posts, or to the adjoining lands, except that of temporary occupation for the purpose of their trade. The whole number of whites under the English allegiance does not, we believe, exceed 500, about one individual to every 700 square miles. By an act passed in 1821 they are subject to the British laws.

The Americans now propose to colonize the territory; and this, as succeeding to the rights of Spain under the Nootka Sound Convention, they are entitled to do. If millions of Americans choose to settle in any part of the territory they may do so; and so may millions of Englishmen. That this would be very inconvenient to both parties is obvious, and luckily the country is so miserable a one that there is no chance of its occurring. But if a few thousands of the people of each nation were to proceed thither, and dot themselves over the best valleys, much disagreeable, perhaps mischievous, quarrelling might ensue. It is clear that this ought to be prevented as soon as possible by a partition. And we now come to the question as to the mode and terms of partition.

The maximum claim of England and the minimum of America is the Columbia; the maximum of America and the minimum of England is the 49th parallel. If each were mad enough to insist on its maximum a collision must ensue.

The best mode of arrangement would be that which has been offered by England, and though not accepted, not definitely rejected by America—arbitration. The dispute after all is a mere question of national pride, and the pride of neither nation could be offended by submission to an award. If that award were to give the whole country down to the Mexican frontier to England, America would suffer no real loss. She would be only prevented from wasting her resources and violating her constitution in the acquisition and defence of what must, in effect, be a distant colony. If the award were to give the whole territory to America, the value of the monopoly enjoyed by the Hudson's

Bay Company would be a little diminished. But as that monopoly is injurious to the English people, we should not bitterly grieve at an event which would reduce the value of the Company's stock one per cent.

If arbitration be unobtainable, the only mode of accommodation is mutual concession; and the terms which we suggest for that mutual concession are those which, if we were arbitrators, we should award; namely, that the boundary should be the 49th parallel, until it meets the Pacific, and then the sea. Our only real claim rests on contiguity, and this would give us more than mere contiguity entitles us to. This would give us the whole of Vancouver's Island, and it would give us an abundance of good harbors. It would also give us the country which is best for the purposes for which we use it, the fur trade. The furs to the north of the 49th parallel are better and more abundant than those to the south. All balancing, however, of the positive advantages to be obtained, by the one nation or by the other on a partition, is mere childishness. The interruption of confidence for a single week costs more than the whole country is worth. A mere armament, though followed by accommodation, would cost more than a thousand times its value. What proportion therefore does it bear to a war?

Whatever be Lord Aberdeen's policy, the opposition will, we trust, not add to its difficulties. The American negotiators will employ against him every sort of misrepresentation of principle and facts; for though the national law of the American courts and legal writers is admirable, that of their diplomatists, and indeed of diplomatists in general, is usually a tissue of sophistry and falsehood. We trust that the English negotiators will not follow their example. We trust that they will not deny every principle of law, however sacred, which they find opposed to them, and every fact, however notorious, that makes against them.

From the Examiner.

The Child of the Islands. A Poem. By the Hon. Mrs. Norton. Chapman and Hall.

THE subject of this poem is the condition of the laboring poor in England. We observe impatience in some of our contemporaries, that such subjects should be dragged into works of imagination. The objection would hold, if amusement were the only drift of fiction, or if "such stuff as dreams are made of" were not the stuff and substance of life itself. "Be what it is," says *Post-humus*, "the action of my life is like it."

Berkeley has said in one of his admirable books (the *Minute Philosopher*) that events are not always in our power, but it always is, to make the best use of the very worst. We take this to be the philosophy of Mrs. Norton's poem, and to be neither dangerous nor jacobinical. She speaks very boldly, but she speaks without offence. She desires to bring rich and poor into closer communication, by kindlier sympathies, and a larger admission of the claims of poverty. She would remind them that, whether through Eden or the Desert, the home to which they travel is the same; and it would be better for both if occasional cordial intercourse took place by the way. In this there is not much to alarm anybody; and not a little perhaps, if they knew it, to do good to every-

body. Self-love and social are the same, says the poet; but the world will not find it out, till they have found out that in all the relations of life justice is an easier and pleasanter thing than its opposite. Mrs. Norton wants something like an agreement on this point, and thinks a vast many wise results will follow it. She thinks in short with the most reflective gaoler on record, (him in *Cymbeline*), who spoke against his present profit, but with a view to higher preferment. "I would we were all of one mind, and our mind good. O! there were desolation of gaolers and gallowses."

The poem appears to have been suggested by the birth of the Prince of Wales, (*The Child of the Islands*), and was originally meant, though the date is of no importance to the subject, to have been published on the first anniversary of the prince's birth. "I designed," says Mrs. Norton, "to contrast the brightness with the shadow that lies beyond and around." She proceeds to say, in words that leave no doubt of the spirit in which she has written, that if she had intended merely to illustrate Difference of Condition, she might have chosen from among those who have heaped up riches or climbed to power. "I selected the Prince of Wales as my illustration, because the innocence of his age, the hopes that hallow his birth, and the hereditary loyalty which clings to the throne, concur in enabling men of all parties, and of every grade in society, to contemplate such a type, not only without envy or bitterness, but with one common feeling of earnest and good will."

The machinery of the poem is very simple. The four seasons of the year are taken to show the features incident to each: acts in the tragedy of poverty, new resources to the luxury of wealth. The baby-hero is reminded at every change of his supreme advantages, and counselled to remember the duties they impose. The sufferings and temptations of the poor pass within his view; the overwrought sempstress, the weaver at his loom, the little trapper in the mines, the homeless wanderer, the despairing suicide; and, worse than all, the cold indifference that would pass these by unmoved, as necessary evils.

"A life of self-indulgence is for Us,
A life of self-denial is for them;
For Us the streets, broad-built and populous,
For them, unhealthy corners, garrets dim,
And cellars where the water-rat may swim!
For Us, green paths refreshed by frequent rain,
For them, dark alleys where the dust lies grim!
Not doomed by Us to this appointed pain—
God made us, Rich and Poor—of what do these complain?"

She who is supposed to speak thus, is drawn tersely and closely—from the life.

Onward she moves, in Fashion's magic glass,
Half-strut, half-swim, she slowly saunters by;
A self-delighting, delicate pampered mass
Of flesh indulged in every luxury
Folly can crave, or riches can supply;
Spangled with diamonds—head, and breast, and zone,
Scorn lighting up her else most vacant eye,
Careless of all conditions but her own,
She sweeps that stuff along, to curtsy to the throne.

"That stuff" is the silk handiwork of the miserable overtasked weaver, whom it has tempted, in his under-paid wretchedness, to crime. The incident is affectingly employed. And let those who would draw from it any false apology for sin, impute no such intention to the writer. Her views are healthy and earnest, and have no sickly sensibility of that kind. But with an honest repugnance to crime and shame, she knows what connexion there is between the wants of the body and of the soul; and is not afraid, even in the persons of the felon and the outcast, to vindicate the humanity which cleaves to all.

What a striking stanza is this which follows a description of a Tyburn crowd, and the shout that arose at the punishment of the miserable felon :

Not always thus. At times a Mother knelt,
And blest the wretch who perished for his
crime ;

Or a young wife bowed down her head, and felt
Her little son an orphan from that time ;
Or some poor frantic girl, whose love sublime
In the coarse highway robber could but see
Her heart's ideal, heard Death's sullen chime
Shivering and weeping on her fainting knee,
And mourned for him who hung high on the gal-
lows-tree.

In this, on the return of the repentant outcast,
what a lovely and exquisite charity :

Renounce her not, grieved Father! Heaven
shall make

Room for her entrance with the undefiled.
Upbraid her not, sad Mother! for the sake
Of days when she was yet thy spotless child,
Be gentle with her, oh, thou sister mild!
And thou, good brother! though by shame
opprest ;

For many a day, amid temptations wild,
Madly indulged, and sinfully carest,
She yearned to weep and die upon thy honest
breast.

In like temper, the Child's Prison at Parkhurst
is visited :

The Saved are there, who would have been the
Lost ;

The Checked in crime, who might have been
the Doomed ;

The wildbriar buds, whose tangled path was
crost

By nightshade poison trailing where they
bloomed !

The Wrecked, round whom the threatening
surges boomed,

Borne in this Life-boat far from peril's stress ;
The Sheltered, o'er whose heads the thunder
loomed ;

Convicts (convicted of much helplessness ;)
Exiles, whom Mercy guides through guilt's dark
wilderness.

—And who can in conscience except to the reflec-
tion it brings !

Nor let it be forgot, for these young spirits,
(Although by gross and vulgar sin defiled,)
How differently judged were their demerits,
Were each a noble or a gentle's child,
Are there no sons at college, "sadly wild?"
No children, wayward, difficult to rear?

Are **THEY** cast off by Love! No, gleaming
mild

Through the salt drops of many a bitter tear,
The rainbow of your hopes shines out of all your
fear!

—Or deny the wisdom that would suggest to the
baby representative of the power and authority of
England, that these things involve the question of
Education also, and proclaim the timely truth that
a word in the ear is better than a halter under it?

Wilt thou not help to educate the poor ?

They will learn something, whether taught
or no ;

The Mind's low dwelling hath an open door,
Whence, wandering still uneasy, to and fro,
It gathers that it should, or should not, know.
Oh, train the fluttering of that restless wing!

Guide the intelligence that worketh woe!
So shall the Summer answer to the Spring,
And a well-guided youth an age of duty bring.

We think what we have quoted excellent writ-
ing; and a mark of advance in the writer. Mrs.
Norton had always great fluency and warmth of
verse; but in such passages as these there are the
higher requisites which satisfy the judgment and
imagination. The poem has its superfluous pas-
sages, and we think the Spenser stanza ill adapted
to the subject, on the whole. It is a temptation to
that indulgence of splendid verbiage, for which
the first great writer who made it famous was
quite as distinguished as its celebrated modern
follower. But, all difficulties and drawbacks al-
lowed, there is a genuine outpouring of mind and
heart in this poem, which leaves us no desire to
dwell on its defects. With large and tolerant
views of human life, it combines a series of scenes
of homely truth and deep tenderness. There is no
false delicacy in its refinement of manner; never
insipid, it is correct and graceful always; and
there is here and there a description of nature, or
a thought involving a natural picture, in just the
right number of words, and most sharply and bril-
liantly defined.

Task-work goes through the world! the fluent
River

Turneth the mill-wheels with a beating sound,
And rolleth onward toward the sea forever!

The Sea heaves restless to its shoreward
bound ;

The Winds with varying voices, wander
round ;

The Branches, in their murmur, bend and thrill ;
Flower after flower springs freshly from the
ground ;

The floating Clouds move ceaseless o'er the hill ;
Nothing is set in calm ; nothing (save Death) is
still.

As we have again opened the poem, we give its
true and pathetic little picture of the boy in the
mine.

So lives the little Trapper underground ;
No glittering sunshine streaks the oozy wall ;
Not even a lamp's cold glimmer shineth round
Where he must sit (through summer days
and all,

While in warm upper air the cuckoos call,)
Forever listening at the weary gate
Where echoes of the unseemly footsteps fall.

(The close of the stanza is poor and prosaic; that
"blows his misery aggravate" could be no aggra-

vation to such a misery as of those seven simple lines.)

Add to all this, that the poem is *interesting*. It is so, both in spirit and execution. There is action in it, feeling and reflection; and its aim, we must repeat, is excellent. One of Johnson's toadies praised him for his fortitude in being unmoved when a strong appeal had been made to his sensibility. "Fortitude, sir!" exclaimed honest old Samuel. "No sir! It was not fortitude, sir! It was stark insensibility." This is the compliment the reader will have merited, who has read Mrs. Norton's book without emotion.

For example, let him turn to the death of the agricultural laborer. We can but quote a few imperfect passages. And first, what an exquisite stanza is this (at once relieving and deepening the misery) which describes him dragging his weary feet to the scene of his death—

Past the Park gate—along the market-road—
And where green water-meadows freshly
shine,

By many a Squire and Peer's unseen abode—
And where the village Alehouse swings its
sign,

Betokening rest, and food, and strengthening
wine—

By the rich dairy, where, at even-tide,
Glad Maidens, singing, milk the lowing
kine—

Under blank shadowing garden-walls, that hide
The espaliered fruit wall trained upon their sunnier
side.

He is found dead, and an inquest is held, with
the old result—

To hear, and acquiesce in, shallow words,
Which make it seem the sickly laborer's fault,
That he hath no accumulated hoards

Of untouched wages; wine, and corn, and
malt;
To use when eyesight fails, or limbs grow
halt;

To hear his character at random slurred—

"An idle fellow, sir, not worth his salt;"

And every one receive a bitter word

For whom his clay-cold heart with living love was
stirred:

His Wife, a shrew and slattern, knowing not
(What all her betters understand so well)

How to bring comfort to a poor man's lot,

How to keep house—and how to buy and sell;

His Daughter, a degraded minx, who fell

At sixteen years—and bore a child of shame,

Permitted with th' immortal set to dwell!

His eldest son, an idiot boy, and lame—

In short the man was starved—but no one was to
blame,

No one:—Oh! "Merry England," hearest
thou?

Houseless and hungry died he on thy breast?

No one:—Oh! "Fertile England," did thy
plough

Furrow no fields; or was their growth repeat
By famine-blights that swept from east to
west?

No one:—"Religious England," preach the
word

In thy thronged temples on the Day of Rest,
And bid the war of Faith and Works accord:—

"Who giveth to the Poor, he lendeth to the Lord!"

Mrs. Norton has no respect for scientific objections to almsgiving; (it was she who wrote a series of letters on that subject in the *Times* which excited some attention four years ago;) and putting aside discussions of benevolence or justice, perfect or imperfect obligation, she asks with fervent eloquence of every class if such things should continue.

While funeral chimes

Toll for the rich, whose graven paragraph

Of vanished virtues, (too complete by half),

The heirs of their importance soothe and please.

The poor man dies—and hath no *ЭПИТАФ!*

What if your churchyards held such lines as

these,

The listless eye to strike—the careless heart to
freeze!

"Here lies a man who died of Hunger-pain,

In a by-street of England's Capital.

Honest, (in vain!) industrious, (in vain!)

Willing to spend in useful labor all

His years from youth to age. A dangerous

fall

Shattered his limbs, and brought him to distress.

His health returned: his strength was past

recall:

He asked assistance, (earnings growing less.)

Received none, struggled on, and died of Want's
excess."

"Here rests in Death, (who rested not in Life!)

The worn-out Mother of a starving brood:

By night and day, with most courageous strife,

She fought hard Fortune to procure them food:

(A desert-pelican, whose heart's best blood

Oozed in slow drops of failing strength away!)

Much she endured: much misery withstood;

At length weak nature yielded to decay,

And baffled Famine seized his long-resisting prey."

Oh! the green mounds, that have no head-stones
o'er them,

To tell who lies beneath, in slumber cold;

Oh! the green mounds, that saw no Mutes de-
plore them,

The Pauper-Graves, for whom no church-bells

tolled;

What if our startled senses could behold,

(As we to Sabbath-prayer walk calmly by,)

Their visionary epitaphs enrolled;

Upstanding grimly 'neath God's equal sky,

Near the white sculptured tombs where wealthier
Christians lie!

We reluctantly close without further extract a poem which has greatly increased our respect and esteem for the writer. Should it reach a second edition, which we will not doubt, it might be well to remove, as irrelevant and in questionable taste, the stanzas that have reference to the Free Church party in Scotland. The illustration by Mr. Mac-lise is extremely beautiful.

SOFTENING STONE.—While Sir William Burnet has been converting wood into stone, another ingenious philosopher has been turning stone into a state of almost fluidity. Mr. Ransome, an engineer at Ipswich, has brought stone almost to the consistence of paste, so that it can be moulded into any shape; it afterwards becomes hard and resumes its original character; it will receive a polish, and can so varnish wood as to render it fire-proof.

From the Polytechnic Review.

A CHAPTER ON EYES.

Of all the various organs of sense, none have so frequently been the theme of a poet's laudations as the eye. Thus consecrated, by time and precedent, as the soft expressions have become, it would be difficult to select a page of rhyme, or rhythm, epic, didactic, lyrical, or dramatic, without finding some allusion to "burning glances," "gentle beamings," or some other poetical attribute of those highly prized and certainly very beautiful little ministers to our noblest sense.

Well! surely they are worthy enough of all this praise; but if repetition be detractive of the beauty of a poetical sentiment, (and but few will doubt it,) then we cannot but admit that the eyes, as regards their poetic attributes, are a somewhat hackneyed theme. It has recently occurred to us, however, when musing in a kind of poetico-philosophical vein, that the subject of eyes is not yet threadbare; it has occurred to us that, without yielding ourselves up to that species of mental aberration which is usually termed poetical, without wandering in the world of dreams and spectres, and giving our imagination carte blanche over veracity, we might yet write a little about the eyes that is at once philosophical and poetical, and, strange enough to say, true withal.

To be serious! How beautiful is it to speculate on the nature of light! How delightful to trace the various forms of the visual organs as they appear in different animals, variously modified as they are to suit their various exigencies! How instructive to regard the clumsy means by which, in our optical instruments, we copy the effective, though simple handicraft of nature!

Understand our purpose well, then, reader. We do not intend to offer you anything like a treatise on the eye, either anatomical, optical, physiological, or philosophical; no, nothing of the sort. We are now in that kind of mood to which most of us are not strangers; too indolent to study, too fatigued to keep wide awake, yet too excited with philosophical musings to sleep, although ever and anon we sink into a kind of reverie. We could not for the life of us expound the rigid principles of a system—we are disinclined, in short, at the present moment, to direct our deepest, our most serious attention, to a philosophical subject; but we would fain amuse ourselves with it a little, and if possible we would also amuse you.

Very crude, indeed, were the opinions of the ancients with regard to the principle of light. Plato imagined it to consist of emanations from the eye itself, which by impinging on objects rendered them luminous; an idea poetical enough in itself, to be sure, but yet not very rational. It would serve, however, to render intelligible the expression of "burning glances," which, according to this Platonic theory, might be darted out from young ladies' eyes. Far more rational was the Pythagorean theory, that light, instead of being an emanation from the eyes themselves, was given off from luminous bodies, and impinged upon the eyes: this explanation is indeed the one now usually received, including as it does two rival theories, one that light consists of actual particles, the other that it consists of waves.

Whatever may be the intimate nature of light, whether it be really matter, or a motion amongst the particles of matter, or whether it be, according to Professor Oersted, merely a succession of elec-

tric sparks—its optical agencies (which is all that now concerns us) are evident enough;—it acts in straight lines, penetrates some bodies, is retarded by others; is of three primitive colors, which were formerly erroneously supposed to be seven, and occupies in travelling a perceptible space of time.

In tracing the gradual development of organs throughout the animal kingdom, we shall be frequently struck with this fact, that as we proceed low in the scale of creation, functions which in ourselves require localized and complex organs, are discharged in a much more simple way. Thus, for instance, in all *mammalia* there is a localized respiratory system consisting of organs called lungs, for the purpose of purifying blood by means of atmospheric air—indeed, all vertebrated animals possess localized organs for this purpose, of one construction or another; but on descending the scale, we find that the respiratory organs, although still specific, become disseminated throughout the body; in the insect tribe of invertebrate animals, for example, breathing is carried on by various tubes on either side of the body: the air is no longer inspired through the mouth, but penetrates the sides; neither does it proceed to localized organs or lungs, but is diffused through the various breathing tubes. Hence the agony and ultimate death of a wasp, when its sides are smeared with oil or syrup, an operation which occludes its breathing pores, and it becomes suffocated. Here we observe one step towards the dissemination of organs for the performance of a specific function: let us descend lower still in the scale of creation until we arrive at the polyp, where there are absolutely no specific organs, either diffused or localized, for the performance of this specific function, and hence respiration can only take place by mere general absorption from the surface or the cavities of these animal bodies.

Now one of the senses, namely, that of touch, is remarkable for its known diffusion. Every part of our bodies is subject to this sensation—we have no specific member for touch, although some parts of our body are more delicate in this respect than others. In some animals, however, this sensation is localized in a remarkable degree—a fact which naturally leads us to inquire whether in certain beings it may not be limited to some specific organ.

Next comes the question whether or not other senses may not be subject to the same variation also—whether, in short, referring to the sense now most specially under our notice, namely, the sense of sight, it may not be in some animals diffused, and require no specific apparatus for its appreciation? It is not doubted that many animals not possessing specific visual organs, without eyes in point of fact, are nevertheless sensible of the influence of the principle of light: the *veretillum cynomorium*, for instance, one of the polypifera, avoids the light, and prefers shaded situations, and yet has no eyes. Other instances might be adduced. It is imagined, therefore, that such animals see with their skin, a condition which, if true, in one particular animal or class of animals, may be supposed by some lusus or freak of nature to be occasionally present in higher creatures, for instance *man*; this granted, we may, if charitably inclined, offer this as a rational hint to the advocate of clairvoyance and mesmerism.

Leaving these beings, which, at the remotest

confines of animated nature, derive their scanty sense of luminosity from impressions so vague that they defy our attempts at explanation, let us rise upwards in the scale of creation, and remark how variously the organs of vision are formed, how modified, how elaborated! until in vertebrata they attain their very acme of perfection.

Those persons who have not been accustomed to view the wonderful disclosures of microscopic life, are but little competent to form even an idea of the myriads of living beings existing in a mere drop of water!—Nay, even vegetable infusions, and most animal and vegetable liquids, teem with life! with minute beings, often highly organized, which have not been merely observed, but actually classified, and their characters and habits—nay, even their anatomy—minutely studied! We do not purpose classifying these minute creatures, but will content ourselves with the casual remark, that most of them, if we are to believe the united testimony of numerous microscopical observers, are possessed of actual organs of specific vision; simple, it is true, and limited as regards power, but nevertheless as localized and as distinct as our own. The eyes of these living beings are little red or darkish spots, adapted to absorb luminous rays, and therefore capable of enabling the animal to distinguish light from darkness, but nothing more; the perception of various tinted hues, and of form and outline, must be to these little beings totally unknown. Eyes scarcely more elaborate than these are found in the leech and snail, animals which, although so much superior to those just described in point of dimensions, are nevertheless but little better provided for in regard to their power of vision.

The eyes of insects are far more elaborate, and present two perfectly distinct varieties or type—they are either simple or compound. Nature, ever bountiful, though never lavish to prodigality of her endowments, gives organs only in proportion as they may minister to the exigencies of an animal: the red eyes of polygastric animalculæ, merely capable of distinguishing light from darkness, are abundantly sufficient for all the necessities of those little creatures; but for the denizens of the insect world—beings whose strength and agility are, in proportion to their size, superior to all other beings who wing their rapid flight, encompassed on all sides by ever-vigilant enemies of larger growth—another and more elaborate ocular apparatus is absolutely necessary. Their simplest eyes (for they have two kinds) are nearly as perfect as our own, consisting of cornea, lens, vitreous humor, and black pigment, which surround the other parts of the visual apparatus, except a minute portion in front, thus forming a pupil and iris—such is the simple insect eye with which some insects—for instance, the cockroach—are alone supplied. Now this eye, perfect though its optical arrangements be, is not imbedded in a movable socket like our own; therefore nature compensates for this defect by giving several of them, placed on various parts of the head. But the most wonderful arrangement consists in aggregating many of these simple eyes into one mass, thus forming a compound eye of many distinct facets, each of which takes in a separate field of vision. Some insects are entirely supplied with these compound eyes—of which the beetle is an example—whilst others possess eyes both simple and compound, for instance, the *sirex gigas*.

A microscope is not absolutely essential to

enable us to see the facets of these compound insect eyes; most persons have looked upon the eye of a common dragon-fly, and seen that their own face was multiplied into a number of little images: the house-fly's eye presents the same appearance, but not so distinctly. This optical appearance depends upon the existence of several facets, each presenting itself under a different angle. By the aid of a microscope these facets have been counted, and then their number may well excite our admiration. In the ant there are fifty of these facets, or eyes; in the house-fly four thousand; in the dragon-fly upwards of twelve thousand; in butterflies upwards of seventeen thousand three hundred and fifty-five have been counted; nay, in some coleopterous or scaly-winged insects there have been numbered no less than twenty-eight thousand and eighty-eight!

How wonderfully constructed is this beautiful organ of insect vision! how admirably adapted to the necessities of insect life! The gaudy dragon-fly, presenting, as he does, such a conspicuous and tempting show of colors to the active swallow, eludes the feathered enemy by superior agility of flight. Mere agility, however, would avail nothing without the aid of powerful eyes; accordingly nature has given him somewhat more than twelve thousand bright and piercing ones—some looking upwards, some downwards, more backwards, and some on either side. Beautiful though they be, and admirable in their contrivance, we must leave the compound eyes of insects, and ascend the animated scale. One step upwards brings us to the *arachnidans*, including spiders, and cheese mites, and scorpions, none of which little beings are insects, although frequently considered as such—they belong, as we have intimated, to the *arachnidans*, and differ from insects in several important particulars: firstly, their head and thorax are joined together; secondly, they possess eight legs, whereas insects have only six; thirdly, instead of antennæ, like insects, they possess terrific weapons of attack and defence—fangs like the spider, or pincers like the scorpion; fourthly, the greater number of them respire by lungs; and last, though not least, their eyes are formed on a different plan, being invariably simple, and made up of parts almost similar to our own.

Amongst the molluscous divisions of animals we have already alluded to the eyes of snails: in some other beings of this tribe, however, the visual organs present remarkable peculiarities. The cuttle-fish is an extraordinary instance of this—its eyes being entirely covered by the external integument or skin, which is transparent, it is true, and thus serves the purpose of cornea in the higher animals.

We next come to the eyes of vertebrate animals, which present all the excellent qualities that the most acute optician could desire, and which are as infinitely superior to the clumsy devices of his art as the pure light of heaven is superior to all other. One thing is particularly interesting in studying the optical devices of the eye—our most perfect optical instruments are formed after the exact principles on which have been constructed those organs: every step towards the improvement of such instruments has been the result of our copying Nature—or rather on our having followed Nature's steps—for although often plagiarists, we were not always conscious of plagiarism.

In the days of Sir Isaac Newton, it was thought

by this great man that refracting telescopes would never be rendered achromatic, or capable of representing white objects without color—their improvement he pronounced hopeless. Opticians, as was natural enough, regarding the opinion of this great man as infallible, gave up the attempt, and made reflecting telescopes exclusively. Refractors, however, have since been rendered achromatic—and how!—why, by copying the mechanism of the eye. Nature suggested the means, but Newton did not take the hint.

We think the beauty of the eye will be more fully appreciated if we previously take a review of the construction and optical properties of telescopes. True, this will be a digression, but what then? we claimed a sort of poetical license in the treatment of our subject, and we will proceed to take it.

The merest tyro in optics knows that light when it passes through transparent bodies is refracted; if the refracting body be plane and of equal thickness, then will various rays of light be equally refracted; if, however, the body be not of equal thickness, whether plane or curvilinear, then other phenomena result, all explicable, however, by a consideration of two facts: firstly, that of the three primitive colors of which white light is composed, each possesses a different refractive power; secondly, that a ray of light impinging on a refracting body of greater density from one of lesser density, is refracted towards the perpendicular, and *vice versâ*.

Now, we take it for granted, that everybody knows the property of a triangular prism in decomposing white light, and the reason of this property. This understood, what we are about to remark will be intelligible enough.

As soon as it was discovered that an arrangement of different lenses in a proper manner would make an instrument capable of rendering remote objects more distinct—in other words, as soon as the discovery of the telescope was accomplished—the observers viewed with regret that the outline of such objects was fringed with an unpleasant misty burr, more or less indistinct, and tinted with numerous colors. The removal of this imperfection was a great desideratum; and amongst others the celebrated Des Cartes imposed on himself the task of accomplishing this great end. He investigated the subject mathematically, and arrived at the conclusion that all lenses which were mere segments of spheres must necessarily possess this defect, inasmuch as their curve is such that they cannot possibly concentrate every ray of light, even of one color, on the same point or focus. He therefore succeeded in determining the form of a particular set of ovals, (termed, after him, the Cartesian ovals,) out of which lenses might be cut which should be free from this injurious quality; and he succeeded to this extent—that with one particular kind of primitive light his lenses overcame the previous indistinctness of vision: with compound light, however—white light for example—the imperfection still remained. Hence opticians no longer troubled themselves to make these Cartesian lenses; and even Newton subsequently pronounced the improvement of refracting telescopes *hopeless*.

Now the indistinct vision of which we have spoken is chiefly produced by the edges of a lens, which, in point of fact, may be regarded as prisms; consequently, the imperfection alluded to, and

called spherical aberration, may in a great measure be obviated by cutting off those edges, or, what amounts to the same thing, by covering them with an opaque diaphragm, as is done in the microscope and telescope. This proceeding, however, does not totally overcome the evil. Newton, who discovered that the different colors of light were possessed of different amounts of refrangibility for the same medium, was not aware that different media possessed different refractive power for the same color. Had he been aware of this fact he would not have pronounced the improvement of refractive telescopes *hopeless*. We will set out with the assumption that one kind of glass disperses one kind of primitive light—viz., for example, blue light—beyond the true focus; theory indicates that another lens of different glass, having a property (if such can be found) of dispersing the other two primitive colors, namely yellow and red, beyond the focus, would counteract the imperfection. Well, this, in modern telescopes, is actually accomplished by using compound lenses made of various kinds of glass. We will, in our next paper, show how beautifully all this knowledge had been anticipated in the construction of the human eye.

A Nomenclature of Colors, Hues, Tints, and Shades, applicable to the Arts and Natural Sciences, to Manufactures, and other purposes of general utility. B. R. HAY, Edinburgh.

[IN this catalogue raisonné of colors, Mr. Hay has reduced to a system of mathematical exactness the constituent parts and value of every modification of separate and combined colors. He shows the proportions, calculated in numerical ratios, that each of the primary colors bears to light and darkness, and the quantity of white and black used to dilute or degrade them in order to produce various tints and shades; also, the arithmetical proportions and degrees of intensity in which the primary colors enter into the composition of the secondary colors, and tertiary and other compounds.

The volume is illustrated by forty plates, each one containing six different hues; forming together a scale of colors sufficiently extensive for all general purposes of the artist or manufacturer: uniformity of the tints in each copy of the work being secured by the adoption of colored papers, in preference to hand-coloring. The simplicity and scientific exactness of this nomenclature recommend it to adoption as a handbook for use in all business where colors are employed, and a standard of positive distinctness is required for reference.

The examples arranged in a tabular form, with the requisite explanations printed on a sheet, would be a serviceable chart to hang up in work-rooms: the chromatic scale might be carried out to its full extent for this purpose.

In an appendix, Mr. Hay hazards a conjecture as to the constitution of the atmosphere in relation to light and sound, that is deserving of scientific consideration.]

RAILWAY ECONOMY.—The saving between driving a sheep to the London market from Lincolnshire and conveying it by railway is proved to be no less than 10 per cent.

From the New Quarterly Review.

Men of Letters of the Time of George III. By LORD BROUGHAM. 1845.

THE proof sheets are before us of a series of highly valuable biographies, ten in number, beginning with Voltaire, and followed by Rousseau, Hume, Robertson, Black, Priestley, Watt, Cavendish, Simpson.

The preface to them contains a just estimate of the peculiar characteristics of the epoch, in the following words:—

“The reign of George III. may in some important respects be justly regarded as the Augustan age of modern history. The greatest statesmen, the most consummate captains, the most finished orators, the first historians, all flourished during this period. For excellence in these departments it was unsurpassed in former times, nor had it even any rivals, if we except the warriors of Louis XIV.'s day, one or two statesmen, and Bolingbroke as an orator. But its glories were not confined to those great departments of human genius. Though it could show no poet like Dante, Milton, Tasso, or Dryden; no dramatist like Shakspeare or Corneille; no philosopher to equal Bacon, Newton, or Locke—it nevertheless in some branches, and these not the least important of natural science, very far surpassed the achievements of former days, whilst of political science, the most important of all, it first laid the foundations, and then reared the superstructure. The science of chemistry almost entirely, of political economy entirely, were the growth of this remarkable era; while even in the pure mathematics a progress was made which almost changed its aspect since the days of Leibnitz and Newton. The names of Black, Watt, Cavendish, Priestley, Lavoisier, Davy, may justly be placed far above the Boyles, the Stahls, the Hales of former times; while Euler, Clairault, Lagrange, La Place, must be ranked as analysts close after Newton himself, and above Descartes, Leibnitz, or the Bernouillis; and in economical science, Hume, Smith, and Quesnai really had no parallel, hardly any fore-runner. It would also be vain to deny great poetical and dramatic genius to Goldsmith, Voltaire, Alfieri, and the German school, how inferior soever to the older masters of song.”

There are those that might object to the canon on poetry with the names of Byron, Scott, and Moore in the period, or think Leibnitz scarcely has his due, and possibly that the German school is treated somewhat unceremoniously—but it is a difficult matter to adjust the relative merits in so vast a field of view, and probably Lord Brougham has formed a better estimate of the exact branches than of the imaginative. His lordship next tells us, and quotes a splendid passage from Sallust for that end, that he has amused himself, in his retirement from office, with these biographies of the distinguished men of a portion of his lordship's own era. We presume the moderns will succeed in their turn, and if we have no historiographers we shall have at least biographies of the great and illustrious, written with powerful vigor, and from one who knows much of many of them. The statesmen of George III. have already passed under his lordship's hand, and now the literati of the same period succeed each other in the present work. With some Lord Brougham has had a personal acquaintance; Robertson was his relation; and there are more favorable circumstances

in Lord Brougham's behalf with many of them, than possibly any other biographer could hope to possess. It is an invidious task to depict talent, when that talent is employed to defame and debase purity and religion. His lordship's remarks relative to three of the biographies before us, Voltaire, Rousseau, and Hume, should, we think, exempt him from severe treatment in including them in the series.

“Although,” he adds, “I have no political animosities to encounter, I fear my historical statements and my commentaries on some lives, as those of Voltaire, Rousseau, and Hume, may find enemies among the two great parties whose principles come in question. The free-thinkers will object to the blame which I have imputed to their favorite authors; the friends of the church may take exception to the praises which I have occasionally bestowed. It may, however, be expected from the justice of both these conflicting bodies, that they will read with attention and with calmness before they condemn. From the former class I can expect no favor beyond what every one has a right to claim from avowed adversaries; a fair hearing is all I desire. To the latter I would address a few words in the spirit of respectful kindness, as to those with whom I generally agree.

“Whoever feels disposed to treat as impious any writer that has the misfortune not to be among the great body of believers, like the celebrated men above named, should bear in mind that the author of these pages, while he does justice to their great literary merits, has himself published, whether anonymously or under his own name, nearly as much in defence of religion as they did against it; and if, with powers so infinitely below theirs, he may hope to have obtained some little success, and done some small service to the good cause, he can only ascribe this fortune to the intrinsic merits of that cause which he has ever supported. He ventures thus to hope that no one will suspect him of being the less a friend to religion, merely because he has not permitted his own belief to make him blind upon the literary merit of men whose opinions are diametrically opposed to his own. His censures of all indecorous, all unfair, all ribald or declamatory attacks, however graced by wit or eloquence, he has never, on any occasion, been slow to pronounce.”—*Pref.*

We shall now open the list, in the order preserved by his lordship, with Voltaire. Lord Brougham conceives that there are three forms under which Voltaire is to be viewed: first, as an atheist and blasphemer; secondly, as one who vents his ribaldry upon the mere ground of his skepticism; and thirdly that of a careless person yielding to a prevailing unbelief. The circumstances of the church of his day are viewed by Lord Brougham as fully constituting the extraordinary problem of Voltaire's mind, and his determined oppo- nence to Christianity. His atheism he considers not proved. We think this matter of much doubt; we allow that he often seemed to speak nobly of God. The celebrated extempore composition on the firmament, composed on a summer's eve, is but a plagiarism on the Pentateuch, and renders unwilling homage to its truth.

“Tous ces vastus pays d'azur et de lumière,
Tirés du sein du vide, formés sans matière,
Guidés sans compas, tournans sans pivot,
N'ont à peine coûté la dépense d'un mot.”

The intent of the "Candide" is also estimated far too gently by Lord Brougham; the obvious inference from that work is, that all things are either accidental when they must be for the worst, or the work of an evil agent. The following passage, however, amply redeems the piety of his lordship from any injury:—

"Let no man severely condemn the untiring zeal of Voltaire, and the various forms of attack which he employed without measure, against the religious institutions of his country, who is not prepared to say that he could have kept entire possession of his own temper, and never cast an eye of suspicion upon the substance of a religion thus abused, nor ever have employed against its perversions the weapons of declamation and of mockery; had he lived under the system which regarded Alexander Borgia as one of its spiritual guides, which bred up and maintained in all the riot of criminal excess an aristocracy having for one branch of its resources the spoils of the altar, which practised persecution as a favorite means of conviction, and cast into the flames a lad of eighteen, charged with laughing as its priests passed by. Such dreadful abuses were present to Voltaire's mind when he attacked the Romish superstitions, and exposed the profligacy, as well as the intolerance, of clerical usurpation. He unhappily suffered them to poison his mind upon the whole to that religion of which these were the abuse; and, when his zeal waxed hot against the whole system, it blinded him to the unfairness of the weapons with which he attacked both its evidences and its teachers."

The powerful authorities of Wilberforce, Lardner, Jeremy Taylor, and Warburton, are all adduced against that prosecution for irreligious opinions, of which we clearly see the evil effects in the Romish hierarchy; and which led, according to Lord Brougham, to the reaction against it on the part of Voltaire; and to this tendency we may, although possibly almost unconsciously, precipitate matters. We proceed to the details of the biography. Voltaire was the son of the Sieur Aronnet, treasurer to the chamber of accounts, a valuable office. His mother was noble, and of the family d'Aumart: he was born on the 20th February, 1694. Voltaire took his name from a small family estate, pursuant to the custom of those days, for the younger children of wealthy commoners to take the name of their estate, leaving to the eldest the family honors. Fontenelle lived to nearly his hundredth year; Voltaire reached his eighty-fifth year—splendid quotations for the longevity of the learned. At twelve years old, some verses to the Dauphin, for an invalid, procured him a legacy of 2,000 francs from Ninon de L'Enclos, to buy books with. Ninon was then ninety, and Voltaire was presented to her by his godfather, the Abbé de Châteauneuf. The court of Me. de Maintenon, which was then in the ascendant, united the saintly and the sinful in a remarkable degree, and this Châteauneuf, with whom Voltaire was much thrown, was unfortunately a person of dissolute morals and of skeptical opinions. Voltaire was destined for the law, and his anxious parent sent him as page or attaché to the French ambassador at the Hague, probably with the intention of getting him clear of infidels and skeptics. A love affair caused him to be sent home. His father, incensed with his conduct, refused to receive him, unless he entered a notary's office; and M. de Caumartin, a family

friend, obtained permission for him to reside in his house at Saint Ange. The Bishop Caumartin, a prelate well acquainted with literary persons, probably excited him to the "Henriade" and his History. On the death of Louis, which occurred on his return to Paris, a libel being ascribed to Voltaire, he was placed in the Bastille; thence he was liberated, and recompensed for his captivity, by the Regent, with a sum of money. After this event he produced his "Œdipe," which was written at eighteen years of age. His first published work was however a devotional poem. The "Œdipe" gave him an introduction to Me. la Maréchale de Villars—Voltaire's first, possibly his only true, passion. He was unsuccessful. His skepticism developed itself both in the composition and performance of the "Œdipe." The lines below were not likely to be soon forgotten in the early part of the 18th century:—

"Nos prêtres ne sont point ce qu'un vain peuple pense—
Notre crédulité fait toute leur science."

Act IV., Scene 4.

We perfectly subscribe to the following criticism on his tragedies generally, and think it felicitously expressed:—

"It is certain that the tragedies of Voltaire are the works of an extraordinary genius, and that only a great poet could have produced them; but it is equally certain that they are deficient for the most part in that which makes the drama powerful over the feelings—real pathos, real passion, whether of tenderness, of terror, or of horror. The plots of some are admirably contrived; the diction of all is pure and animated; in most passages it is pointed, and in many it is striking, grand, impressive; the characters are frequently well imagined and portrayed, though without sufficient discrimination; and thus often running one into another, from the uniformity of the language, terse, epigrammatic, powerful, which all alike speak. Nor are there wanting situations of great effect, and single passages of thrilling force; but, after all, the heart is not there; the deep feeling, which is the parent of all true eloquence as well as all true poetry, didactic and satirical excepted, is rarely perceived; it is rather rhetoric than eloquence, or, at least, rather eloquence than poetry. It is declamation of a high order in rhyme; no blank verse, indeed, can be borne on the French stage, or even in the French tongue; it is not fine dramatic composition: the periods roll from the mouth, they do not spring from the breast; there is more light than heat; the head rather than the heart is at work."

The Zaire alone is excepted from the above.

The "Œdipe" was performed in 1718, and in a few years was followed by the "Henriade." This poem, not without fine passages, is at such an immeasurable distance from the great epic writers that it was intended to rival, that we entertain little doubt that the disappointment produced the "Pucelle." The following remarks are both just, and do Lord Brougham's heart great honor:—

"The 'Pucelle' is one continued sneer at all that men do hold, and all that they ought to hold, sacred, from the highest to the least important subjects, in a moral view—from the greatest to the most indifferent, even in a critical view. Religion and its ministers and its professors—virtue, especially the virtues of a prudential cast—the feel-

ings of humanity—the sense of beauty—the rules of poetical composition—the very walks of literature in which Voltaire had most striven to excel—are all made the constant subject of sneering contempt, or of ribald laughter; sometimes by wit, sometimes by humor, not rarely by the broad grins of mere gross buffoonery. It is a sad thing to reflect that the three masterpieces of three such men as Voltaire, Rousseau, Byron, should all be the most immoral of their compositions. It seems as if their prurient nature had been affected by a bad but criminal excitement to make them exceed themselves. Assuredly if such was not Voltaire's case, he well merits the blame; for he scrupled not to read his 'Pucelle' to his niece, then a young woman."

Would any one credit that this production could issue from the same person who wrote the "Discours sur l'Homme!" Who can avoid being struck with lines like the following, from such a man, and not in them see much reason for a belief, however we must qualify it, that the corruption mingled with truth led him to mistake the truth for the corruption:—

"Malgré la sainteté de son auguste emploi,
C'est n'être bon à rien de n'être bon qu'à toi."

Lord Brougham has simply alluded to the recognition of the Christ in this poem; but the passage is so fine and so uncommon for Voltaire, that we give it at length:—

"Quand l'ennemi divin des scribes et des prêtres
Chez Pilate autrefois fut traîné par des traîtres;
De cet air insolent qu'on nomme dignité,
Le Romain demanda, qu'est ce que vérité?
L'Homme Dieu qui pouvait l'instruire ou le confondre,

A ce juge orgueilleux dédaigna de répondre.
Son silence éloquent disait assez à tous
Que ce vrai tant cherché ne fut point fait pour nous.

Mais lorsque pénétré d'une ardeur ingénue,
Un simple citoyen l'aborda dans la rue,
Et que, disciple sage, il prétendit savoir,
Quel est l'état de l'homme, et quel est son devoir;
Sur ce grand intérêt, sur ce point qui nous touche,
Celui qui savait tout, ouvrit alors la bouche;
Et dictant d'un seul mot ses décrets solennels;
'Aimez Dieu,' lui dit-il, 'mais aimez les mortels.'
Voilà l'homme et sa loi, c'est assez; le ciel même

A daigné tout nous dire en ordonnant qu'on aime."

But we must resume the somewhat broken narrative:—After the appearance of the "Cedipe," Voltaire became the friend of the Duc de Richelieu, shared in his disgrace, and was forced to quit Paris. His well-known quarrel with the Chevalier de Rohan, we shall not enter on farther than to remark, that it was the occasion of his visiting England, of his acquaintance with Pope, and of a large sum realized for the "Henriade," a subscription in favor of which, was promoted by Queen Caroline, then Princess of Wales. A successful lottery speculation combined with this, enabled him to live at ease the remainder of his life. If he also did not succeed in comprehending our illustrious Newton—for no one can understand Newton, who is unequal to his powerful analysis, with which Voltaire had never even a rudimentary acquaintance—his sincerity in advocating what he believed to be the true system, is undoubted. He certainly

contributed largely to overthrow the Cartesian philosophy. Can one wonder much, when D'Aguesseau refused the license to publish his statement of Newton's discoveries, at his indignation! This enthusiasm for Newton led to the liaison of his life with the Marquise de Chatelet. This lady analyst was often surrounded with philosophers of kindred pursuits; the imprudence of the Marquis, her husband, rendered even the pecuniary assistance of Voltaire by no means superfluous; and at Cirey, her seat, many of his most celebrated works first saw the light. From her and Chairault, he was doubtless greatly assisted in the compilation of his Newtonian Philosophy. We differ from Lord Brougham in the opinion, that had Voltaire followed out the analytic sciences, he would have succeeded. The minds of men like Voltaire and Lord Brougham are ill calculated for success in such pursuits. There is too much discursiveness—too deep a desire to know much of many things, to permit of this abstraction upon one. The orator and the wit are conscious that they possess far more generally-fascinating points, and cannot forego either the rostrum or the club. Their very excellence in words prevents their acquisition of abstract ideas. They dwell on the outward, and rarely go deeply inward, except in their own favorite pursuits; they are certainly not constant to abstract sciences long. Any one who attempts to learn Newton by the medium of Voltaire, will be plunged into the most inextricable difficulties that a person could well desire to be involved in; of this, Lord Brougham has furnished a rather amusing condensation. In the "Courte Réponse aux longs Discours d'un Docteur Allemand," he says, "La racine carré du cube des révolutions des planètes et les carrés de leurs distances faisaient encore des ennemis." In this passage there are three blunders. The square root of the cube is taken for the cube; the revolutions, for the distances; and the squares for the cubes. Voltaire was, however, not deficient in philosophic perception; and experimented largely. Our author says of him, as an experimental philosopher:—

"The experiments which he made on the heat of fluids mixed together, of different temperatures before their mixture, led him to remark the difference of the temperature when mixed from what might have been expected by combining the separate temperatures before mixture. Need I add that this is precisely the course of experiment and observation which led Black to his celebrated discovery of latent heat a quarter of a century later!"
—p. 581.

While at Cirey, he made the acquaintance of Frederick, then Prince Royal of Prussia; and, in 1749, experienced the loss of the Marchioness, who was suddenly taken ill at Luneville, while engaged on the "Principia," and died in labor of a girl, born before she could be put to bed. His eccentric railleury scarce forsook him, even at the period of her dissolution. He requests, in a letter addressed to Me. du Defand, permission to weep for one "qui avec ses foiblesses avait une âme respectable." Her death probably led him to embrace Frederick's offer of an establishment at Berlin. Voltaire was certainly nobly treated at the commencement by the king: but nothing could attach Voltaire long to anything; and the king, as a moral character, was beneath contempt. The monarch that could write to M. Darget a letter of apparently Christian condolence with him on the loss of his wife, and that very day sit down de-

liberately to libelling the dead like him, could not long have loved anything. We have this story, however, on the authority of Voltaire, at a time when it was probably getting pretty clear to him, that Frederick only valued him for such points as must prove anything but satisfactory to the wit; and that the king claimed full privilege to avail himself of sarcasm for sarcasm, coup for coup. How fearfully does the letter, addressed by him to his niece, (Correspon. Gén., Nov., 1750,) indicate that guilty unions contain in them their doom and dissolution!—"J'ai bien peur de dire au Roi de Prusse comme Jasmine, 'Vous n'êtes pas trop corrigé, mon maître.' J'avais vu une lettre touchante, pathétique, et même fort Chrétienne, que le roi avait daigné écrire à Darget, sur la mort de sa femme. J'ai appris que le même jour sa majesté avait fait une épigramme contre la defunte; cela ne laisse pas de donner à penser."—This was indeed the disciple beating his master at his own weapons; Pheidippides turning on Strepsiadés, and beating him with his own teaching. Nothing can appear more mean, than the miserable reluctance of Voltaire, to quit the court of Prussia, when every degree of obloquy had been heaped upon him. They were apparently afterwards on something like a friendly footing; but Voltaire never forgot nor forgave the treatment he had experienced from the philosopher king. On the 6th August, 1757, he wrote "*L'ennemi public* sera pris de tous côtés. Vive Marie Thérèse!"

At Berlin he had finished his "*Siècle de Louis XIV.*" There also he began his correspondence with Diderot and D'Alembert, who were engaged in editing their famous Encyclopædia. We extract the passage from Lord Brougham descriptive of his conduct in this publication:—

"On this remarkable occasion he put forth all those qualities which form a party-chief, and gain over the warm support of his followers—ardor, good humor, patience, courage, tolerance activity, knowledge, skill. The '*Encyclopédie*,' as is well known, was, after a few years, no longer suffered to appear openly in France. In 1751 and the following years, the first seven volumes appeared at Paris under Diderot and D'Alembert; in 1758 it was stopped, at a time when its sale had reached no less than 3,000, ('*Cor. Gén.*' v. 137,) and the remaining ten volumes were published in 1775 at Neuchâtel under Diderot alone. The four volumes of supplement were published in 1776 and 1777 at Amsterdam. All the eleven volumes of plates were published at Paris between 1762 and 1772, and the supplemental volume of plates in 1777. The whole of this great work thus consisted of thirty-three folio volumes. Some of Voltaire's articles are clever, and abound with good reflections. The greater number of them are too light, having the fault which he certainly imputes to many of the other contributors in his '*Letters*,' when he observes that they are fitter for a magazine than an encyclopædia."

The "*Voyage de Scarmentado*," and "*Zadig*," had been written at Cirey. On the return from Potsdam we have the "*Micromégas*." Voltaire had as strongly approximated to Swift in a large portion of his career, as Rousseau had to Sterne. Soon after his establishment at Geneva we have his most finished work, the "*Essai des Mœurs*." "*Candide*" is of the same epoch. The "*Essai*" was rapidly followed by a series of works from various pens on the same principle; and certainly by the extent of its plan, and the judiciousness of

its method, deserved imitation. The "*Charles the XII.*" and the "*Peter the Great*," are interesting, but the latter was written too close to Russia to be true or faithful. The credulity of Voltaire in both these works appears unbounded. The "*Siècle de Louis Quatorze*" is well known, and needs little mention. Of the romances, "*Zadig*" is an old favorite with us, and we think by far the best of them. Forced to quit the "*délices*" at Geneva, Voltaire proceeded to Ferney, within the French frontier, and during this portion of his life some incidents redound greatly to his honor. The cases of Calas and La Barre prove him to have possessed genuine sentiments of philanthropy, and how deeply must both these instances have confirmed his ancient antipathy against the Roman Catholic religion! Would it were possible to applaud all in Voltaire at this period; but while attentive to the vindication of individuals from tyranny, the flattery of Frederick and Catharine led him to sanction the foul usurpation by which the partition of Poland was effected in 1772. Lord Brougham has deeply felt the wrong then enacted, and the biographer of Voltaire nobly exposes the wrongs perpetrated by the autocrat and her coadjutor. His servility here is as odious as in the former instance. No insults could compel him to quit the court of Berlin, even when it execrated and derided him. In the three quarrels of his life, with Frederick, Maupertius, and Rousseau, whatever he thought of the two first, in the latter he was mean, selfish and ungenerous. And yet Rousseau behaved generously, even nobly to him; and when the remark that the "*Irène*," his last finished tragedy, exhibited the decline of genius, he said frankly, "were it true, that the remark were brutal." The "*Irène*" is a wonderful effort for a man of 84. We extract the reception of Voltaire, after an absence from Paris of 27 years, in Lord Brougham's own words:—

"After an absence of above seven-and-twenty years he revisited Paris with his niece, who, at the beginning of 1778, wished to accompany thither a young lady, recently married to M. Vilette. Voltaire had just finished '*Irène*,' and had a desire to see its representation. The reception he met with in every quarter was enthusiastic. He had outlived all his enemies, all his detractors, all his quarrels. The academy, which had, under the influence of court intrigues, now long forgotten, delayed his admission till his fifty-second year, seemed now anxious to repair its fault, and received him with honors due rather to the great chief than to a fellow-citizen in the commonwealth of letters. All that was most eminent in station or most distinguished in talents—all that most shone in society or most ruled at court, seemed to bend before him—the homage of every class and of every rank was tendered to him—and it seemed as if one universal feeling prevailed, the desire of having it hereafter to say—'I saw Voltaire.' But, in a peculiar manner, his triumphant return was celebrated at the theatre. Present at the third night of '*Irène*,' all eyes were turned from the stage to the poet, whose looks, not those of the actors, were watched from the rising to the falling of the curtain. Then his bust was seen on the stage, and crowned with chaplets, among the shouts and the tears of the audience. He left the house, and hundreds pressed forward to aid his feeble steps as he retired to his carriage. No one was suffered to sustain him above an instant—

ings of humanity—the sense of beauty—the rules of poetical composition—the very walks of literature in which Voltaire had most striven to excel—are all made the constant subject of sneering contempt, or of ribald laughter; sometimes by wit, sometimes by humor, not rarely by the broad grins of mere gross buffoonery. It is a sad thing to reflect that the three masterpieces of three such men as Voltaire, Rousseau, Byron, should all be the most immoral of their compositions. It seems as if their prurient nature had been affected by a bad but criminal excitement to make them exceed themselves. Assuredly if such was not Voltaire's case, he well merits the blame; for he scrupled not to read his 'Pucelle' to his niece, then a young woman."

Would any one credit that this production could issue from the same person who wrote the "Discours sur l'Homme?" Who can avoid being struck with lines like the following, from such a man, and not in them see much reason for a belief, however we must qualify it, that the corruption mingled with truth led him to mistake the truth for the corruption:—

"Malgré la sainteté de son anguste emploi,
C'est n'être bon à rien de n'être bon qu'à toi."

Lord Brougham has simply alluded to the recognition of the Christ in this poem; but the passage is so fine and so uncommon for Voltaire, that we give it at length:—

"Quand l'ennemi divin des scribes et des prêtres
Chez Pilate autrefois fut traîné par des traîtres;
De cet air insolent qu'on nomme dignité,
Le Romain demanda, qu'est ce que vérité!
L'Homme Dieu qui pouvait l'instruire ou le confondre,

A ce juge orgueilleux dédaigna de répondre.
Son silence éloquent disait assez à tous
Que ce vrai tant cherché ne fut point fait pour nous.

Mais lorsque pénétré d'une ardeur ingénue,
Un simple citoyen l'aborda dans la rue,
Et que, disciple sage, il prétendit savoir,
Quel est l'état de l'homme, et quel est son devoir;
Sur ce grand intérêt, sur ce point qui nous touche,
Celui qui savait tout, ouvrit alors la bouche;
Et dictant d'un seul mot ses décrets solennels;
'Aimez Dieu,' lui dit-il, 'mais aimez les mortels.'
Voilà l'homme et sa loi, c'est assez; le ciel même

A daigné tout nous dire en ordonnant qu'on aime."

But we must resume the somewhat broken narrative:—After the appearance of the "Œdipe," Voltaire became the friend of the Duc de Richelieu, shared in his disgrace, and was forced to quit Paris. His well-known quarrel with the Chevalier de Rohan, we shall not enter on farther than to remark, that it was the occasion of his visiting England, of his acquaintance with Pope, and of a large sum realized for the "Henriade;" a subscription in favor of which, was promoted by Queen Caroline, then Princess of Wales. A successful lottery speculation combined with this, enabled him to live at ease the remainder of his life. If he also did not succeed in comprehending our illustrious Newton—for no one can understand Newton, who is unequal to his powerful analysis, with which Voltaire had never even a rudimental acquaintance—his sincerity in advocating what he believed to be the true system, is undoubted. He certainly

contributed largely to overthrow the Cartesian philosophy. Can one wonder much, when D'Aguesseau refused the license to publish his statement of Newton's discoveries, at his indignation! This enthusiasm for Newton led to the liaison of his life with the Marquise de Chatelet. This lady analyst was often surrounded with philosophers of kindred pursuits; the imprudence of the Marquis, her husband, rendered even the pecuniary assistance of Voltaire by no means superfluous; and at Cirey, her seat, many of his most celebrated works first saw the light. From her and Chairault, he was doubtless greatly assisted in the compilation of his Newtonian Philosophy. We differ from Lord Brougham in the opinion, that had Voltaire followed out the analytic sciences, he would have succeeded. The minds of men like Voltaire and Lord Brougham are ill calculated for success in such pursuits. There is too much discursiveness—too deep a desire to know much of many things, to permit of this abstraction upon one. The orator and the wit are conscious that they possess far more generally-fascinating points, and cannot forego either the rostrum or the club. Their very excellence in words prevents their acquisition of abstract ideas. They dwell on the outward, and rarely go deeply inward, except in their own favorite pursuits; they are certainly not constant to abstract science long. Any one who attempts to learn Newton by the medium of Voltaire, will be plunged into the most inextricable difficulties that a person could well desire to be involved in; of this, Lord Brougham has furnished a rather amusing condensation. In the "Courte Réponse aux longs Discours d'un Docteur Allemand," he says, "La racine carré du cube des révolutions des planètes et les carrés de leurs distances faisaient encore des ennemis." In this passage there are three blunders. The square root of the cube is taken for the cube; the revolutions, for the distances; and the squares for the cubes. Voltaire was, however, not deficient in philosophic perception; and experimented largely. Our author says of him, as an experimental philosopher:—

"The experiments which he made on the heat of fluids mixed together, of different temperatures before their mixture, led him to remark the difference of the temperature when mixed from what might have been expected by combining the separate temperatures before mixture. Need I add that this is precisely the course of experiment and observation which led Black to his celebrated discovery of latent heat a quarter of a century later!"

—p. 581.

While at Cirey, he made the acquaintance of Frederick, then Prince Royal of Prussia; and, in 1749, experienced the loss of the Marchioness, who was suddenly taken ill at Luneville, while engaged on the "Principia," and died in labor of a girl, born before she could be put to bed. His eccentric raillery scarce forsook him, even at the period of her dissolution. He requests, in a letter addressed to Me. du Deffand, permission to weep for one "qui avec ses foiblesses avait une âme respectable." Her death probably led him to embrace Frederick's offer of an establishment at Berlin. Voltaire was certainly nobly treated at the commencement by the king: but nothing could attach Voltaire long to anything; and the king, as a moral character, was beneath contempt. The monarch that could write to M. Darget a letter of apparently Christian condolence with him on the loss of his wife, and that very day sit down de-

liberately to libelling the dead like him, could not long have loved anything. We have this story, however, on the authority of Voltaire, at a time when it was probably getting pretty clear to him, that Frederick only valued him for such points as must prove anything but satisfactory to the wit; and that the king claimed full privilege to avail himself of sarcasm for sarcasm, coup for coup. How fearfully does the letter, addressed by him to his niece, (Correspon. Gén., Nov., 1750,) indicate that guilty unions contain in them their doom and dissolution!—"J'ai bien peur de dire au Roi de Prusse comme Jasmine, 'Vous n'êtes pas trop corrigé, mon maître.' J'avais vue une lettre touchante, pathétique, et même fort Chrétienne, que le roi avait daigné écrire à Darget, sur la mort de sa femme. J'ai appris que le même jour sa majesté avait fait une épigramme contre la défunte; cela ne laisse pas de donner à penser."—This was indeed the disciple beating his master at his own weapons; Pheidippides turning on Strepsiades, and beating him with his own teaching. Nothing can appear more mean, than the miserable reluctance of Voltaire, to quit the court of Prussia, when every degree of obloquy had been heaped upon him. They were apparently afterwards on something like a friendly footing; but Voltaire never forgot nor forgave the treatment he had experienced from the philosopher king. On the 6th August, 1757, he wrote "*L'ennemi public sera pris de tous côtés. Vive Marie Thérèse!*"

At Berlin he had finished his "*Siècle de Louis XIV.*" There also he began his correspondence with Diderot and D'Alembert, who were engaged in editing their famous Encyclopedia. We extract the passage from Lord Brougham descriptive of his conduct in this publication:—

"On this remarkable occasion he put forth all those qualities which form a party-chief, and gain over the warm support of his followers—ardor, good humor, patience, courage, tolerance activity, knowledge, skill. The '*Encyclopédie*,' as is well known, was, after a few years, no longer suffered to appear openly in France. In 1751 and the following years, the first seven volumes appeared at Paris under Diderot and D'Alembert; in 1758 it was stopped, at a time when its sale had reached no less than 3,000, ('*Cor. Gén.*' v. 127.) and the remaining ten volumes were published in 1775 at Neufchâtel under Diderot alone. The four volumes of supplement were published in 1776 and 1777 at Amsterdam. All the eleven volumes of plates were published at Paris between 1763 and 1772, and the supplemental volume of plates in 1777. The whole of this great work thus consisted of thirty-three folio volumes. Some of Voltaire's articles are clever, and abound with good reflections. The greater number of them are too light, having the fault which he certainly imputes to many of the other contributors in his '*Letters*,' when he observes that they are fitter for a magazine than an encyclopædia."

The "*Voyage de Scarmentado*," and "*Zadig*," had been written at Cirey. On the return from Potsdam we have the "*Micromegas*." Voltaire had as strongly approximated to Swift in a large portion of his career, as Rousseau had to Sterne. Soon after his establishment at Geneva we have his most finished work, the "*Essai des Mœurs*." "*Candide*" is of the same epoch. The "*Essai*" was rapidly followed by a series of works from various pens on the same principle; and certainly by the extent of its plan, and the judiciousness of

its method, deserved imitation. The "*Charles the XII.*" and the "*Peter the Great*," are interesting, but the latter was written too close to Russia to be true or faithful. The credulity of Voltaire in both these works appears unbounded. The "*Siècle de Louis Quatorze*" is well known, and needs little mention. Of the romances, "*Zadig*" is an old favorite with us, and we think by far the best of them. Forced to quit the "*délices*" at Geneva, Voltaire proceeded to Ferney, within the French frontier, and during this portion of his life some incidents redound greatly to his honor. The cases of Calas and La Barre prove him to have possessed genuine sentiments of philanthropy, and how deeply must both these instances have confirmed his ancient antipathy against the Roman Catholic religion! Would it were possible to applaud all in Voltaire at this period; but while attentive to the vindication of individuals from tyranny, the flattery of Frederick and Catharine led him to sanction the foul usurpation by which the partition of Poland was effected in 1772. Lord Brougham has deeply felt the wrong then enacted, and the biographer of Voltaire nobly exposes the wrongs perpetrated by the autocrat and her coadjutor. His servility here is as odious as in the former instance. No insults could compel him to quit the court of Berlin, even when it execrated and derided him. In the three quarrels of his life, with Frederick, Maupertius, and Rousseau, whatever he thought of the two first, in the latter he was mean, selfish and ungenerous. And yet Rousseau behaved generously, even nobly to him; and when the remark that the "*Irène*," his last finished tragedy, exhibited the decline of genius, he said frankly, "were it true, that the remark were brutal." The "*Irène*" is a wonderful effort for a man of 84. We extract the reception of Voltaire, after an absence from Paris of 27 years, in Lord Brougham's own words:—

"After an absence of above seven-and-twenty years he revisited Paris with his niece, who, at the beginning of 1778, wished to accompany thither a young lady, recently married to M. Vilette. Voltaire had just finished '*Irène*,' and had a desire to see its representation. The reception he met with in every quarter was enthusiastic. He had outlived all his enemies, all his detractors, all his quarrels. The academy, which had, under the influence of court intrigues, now long forgotten, delayed his admission till his fifty-second year, seemed now anxious to repair its fault, and received him with honors due rather to the great chief than to a fellow-citizen in the commonwealth of letters. All that was most eminent in station or most distinguished in talents—all that most shone in society or most ruled at court, seemed to bend before him—the homage of every class and of every rank was tendered to him—and it seemed as if one universal feeling prevailed, the desire of having it hereafter to say—'I saw Voltaire.' But, in a peculiar manner, his triumphant return was celebrated at the theatre. Present at the third night of '*Irène*,' all eyes were turned from the stage to the poet, whose looks, not those of the actors, were watched from the rising to the falling of the curtain. Then his bust was seen on the stage, and crowned with chaplets, among the shouts and the tears of the audience. He left the house, and hundreds pressed forward to aid his feeble steps as he retired to his carriage. No one was suffered to sustain him above an instant—

ings of humanity—the sense of beauty—the rules of poetical composition—the very walks of literature in which Voltaire had most striven to excel—are all made the constant subject of sneering contempt, or of ribald laughter; sometimes by wit, sometimes by humor, not rarely by the broad grins of mere gross buffoonery. It is a sad thing to reflect that the three masterpieces of three such men as Voltaire, Rousseau, Byron, should all be the most immoral of their compositions. its method, deserved imitation. The "*Charles the XII.*" and the "*Peter the Great*," are interesting, but the latter was written too close to Russia to be true or faithful. The credulity of Voltaire in both these works appears unbounded. The "*Siècle de Louis Quatorze*" is well known, and needs little mention. Of the romances, "*Zadig*" is an old favorite with us, and we think by far the best of them. Forced to quit the "*délices*" at Geneva, Voltaire proceeded to Ferney, within the French frontier, and during this portion of his life some incidents redound greatly to his honor. The cases of Calas and La Barre prove him to have possessed genuine sentiments of philanthropy, and how deeply must both these instances have confirmed his ancient antipathy against the Roman Catholic religion! Would it were possible to applaud all in Voltaire at this period; but while attentive to the vindication of individuals from tyranny, the flattery of Frederick and Catharine led him to sanction the foul usurpation by which the partition of Poland was effected in 1772. Lord Brougham has deeply felt the wrong then enacted, and the biographer of Voltaire nobly exposes the wrongs perpetrated by the autocrat and her coadjutor. His servility here is as odious as in the former instance. No insults could compel him to quit the court of Berlin, even when it execrated and derided him. In the three quarrels of his life, with Frederick, Maupertuis, and Rousseau, whatever he thought of the two first, in the latter he was mean, selfish and ungenerous. And yet Rousseau behaved generously, even nobly to him; and when the remark that the "*Irène*," his last finished tragedy, exhibited the decline of genius, he said frankly, "were it true, that the remark were brutal." The "*Irène*" is a wonderful effort for a man of 84. We extract the reception of Voltaire, after an absence from Paris of 27 years, in Lord Brougham's own words:—

"After an absence of above seven-and-twenty years he revisited Paris with his niece, who, at the beginning of 1778, wished to accompany thither a young lady, recently married to M. Vilette. Voltaire had just finished '*Irène*,' and had a desire to see its representation. The reception he met with in every quarter was enthusiastic. He had outlived all his enemies, all his detractors, all his quarrels. The academy, which had, under the influence of court intrigues, now long forgotten, delayed his admission till his fifty-second year, seemed now anxious to repair its fault, and received him with honors due rather to the great chief than to a fellow-citizen in the commonwealth of letters. All that was most eminent in station or most distinguished in talents—all that most shone in society or most ruled at court, seemed to bend before him—the homage of every class and of every rank was tendered to him—and it seemed as if one universal feeling prevailed, the desire of having it hereafter to say—'*I saw Voltaire.*' But, in a peculiar manner, his triumphant return was celebrated at the theatre. Present at the third night of '*Irène*,' all eyes were turned from the stage to the poet, whose looks, not those of the actors, were watched from the rising to the falling of the curtain. Then his bust was seen on the stage, and crowned with chaplets, among the shouts and the tears of the audience. He left the house, and hundreds pressed forward to aid his feeble steps as he retired to his carriage. No one was suffered to sustain him above an instant—

all must enjoy the honor of having once supported Voltaire's arm. Countless multitudes attended him to his apartments, and as he entered they knelt to kiss his garments. The cries of 'Vive Voltaire!' 'Vive la Henriade!' 'Vive Zaire!' pierced the air. The aged poet's heart was moved with tenderness. 'On yeut' (he feebly cried)—'on veut me faire mourir de plaisir! On m'étouffe de roses.'—(P. 121.)

Franklin and Voltaire met on that occasion. The philosopher presented his grandson to Voltaire, and asked a blessing. "God and liberty is the only one fitting for Franklin's children," was the reply,—a somewhat vague benediction, but Voltaire ill understood the sacerdotal character. During his short stay at Paris, Voltaire busied himself in many literary works, on "Agathocles," another tragedy, prevailed on the French Academy to prepare its Dictionary, and at 85 commenced with the letter A. But his labors were too much for him, and he was seized with a spitting of blood. Fresh exertions produced sleeplessness; this was attempted to be remedied by opium, and Condorcet says he died by the mistake of a servant in one of the doses. This was on the 30th of May, 1778. Four days before his death he wrote to Lally Tolendal to say that he died happy on hearing the reversal of the decree against his father. Some verses, written to the Abbé de l'Attaignant ten days before his decease, display extraordinary vigor. In his last illness the clergy gathered around him, and he conformed to the Roman ritual; in confession and absolution. The formula, however, that certified this not being sufficiently ample, the Abbé Genthur was requested to get further details, with a threat that the burial certificate would otherwise be withheld. Voltaire recovered from his illness, but on his real death-bed the curé insisted on a full confession. When he came to the article of the divinity of our Lord, which he was required to sign, he burst forth into an exclamation that abundantly removed all doubts of his infidelity. His remains were consequently forbidden interment in consecrated ground, but the ceremony had already taken place in a monastery of which his nephew was abbot.

Such was Voltaire; and with every feeling to think well of many parts of his character, we consider Lord Brougham too merciful with respect to his general character. Allowing for the disgust produced by an ignorant priesthood—for the bigotry, the cruelty, and almost daily murders that marked its way, we cannot think Voltaire absolved, or even much extenuated in guilt. We admit the full force of a corrupt era, of an early run of evil misbelieving associates;—we can allow for temperament, wit, and sarcasm, but still there remains so powerful a mass yet to be removed from his memory, that we cannot admit him to our sympathy as misled, or our judgment as in the right. The parallel drawn by Lord Brougham between him and Luther, as two lords over a vast era of thought, does not hold. Luther said much, wrote much, did much, that we could wish forgotten, but he proselyted to an eternity, he cleared up the passage of the light to millions; and to Voltaire we stand indebted neither for accurate philosophy, true history, or genuine philanthropy. The fearful horrors that followed his era are decidedly traceable to him, and the blood on the hands of the murderous poissardes was originated in the high priest of that revolution, who had taught the people to despise religion and to sanc-

tify error. Powerful indeed was the sweep of his mind, fearful the blasphemous bon-mots incessantly retailed by him against God, and the Faith, and the Christ. If we concede that he was not an atheist, what was he? Did he know himself? Is it not the fatal character of such natures that they lie unto themselves, until the internal monitor ceases to indicate truth? Who can look on the correspondence between him and D'Alembert, and pronounce it that of men of honor, truth, probity, common honesty, or virtue? With Frederick of Prussia, nothing can exceed his baseness and meanness; to please Catherine of Russia, the father of the revolution appears amazingly anxious to stifle freedom in other countries, whatever be claimed for himself in France. There will not remain for the admirers of Voltaire much to set off against these heavy accusations: indifferent scholarship, extreme inaccuracy of facts, wilful lies, baseless authorities for baseless assertions. His attacks on Christianity are all ill conducted, developing the grossest ignorance of Greek, of Hebrew, of the cognate tongues, passages unfairly warped, even words surreptitiously introduced in quotation; and though ridicule can never be refuted, yet it does not follow that it is either based on reason or right. To him Christianity owes a negative obligation doubtless,—that he occasioned numerous replies of high value by works which scarce merited refutation. We pass the last and foulest page, the obscenity of his works, the offence against good taste, his idol, as well as against morality; and we think him fortunate in having so gentle a chronicler as Lord Brougham, to whom he has affinities that, doubtless, have to a certain extent endeared him; but the type fails on that one subject, the most important of the earth, *the Belief in the Revelation*, a subject to which Lord Brougham has devoted his best energies, and thereby interposed, like the good Lord Kenyon, with a voice judicial, against both obscenity and blasphemy. Ere we pass to Rousseau, the next life, we must refer our readers to the appendix, for one anecdote told by Lord Brougham, with regard to Voltaire, stimulated by the passage in Rousseau, rising to look at the sun. We commend it to the attention of our readers, but there is something so repellingly horrid in the final expression that we cannot venture to shock their feelings by relating it. It is characteristic of the man, and of his unceasing hostility to the faith—how generated within him, and how justified, we have already shown. The great space we have occupied on Voltaire will prevent our dwelling with equal length on the remaining biographies. Rousseau is the next. Jean Jacques Rousseau was born at Geneva, on the 28th June, 1712. Lord Brougham has followed the "Confessions" pretty closely, in the early events, which as they are well known we shall not particularize. It certainly does appear that the Romish Church of that period contributed in no small degree to the production of infidels. The first religious society into which Rousseau entered, the Seminary of Catechists for the Conversion of Heretics, was the most depraved spot conceivable; and the bigotry which demanded of the son the belief in the utter damnation of his mother, as an indispensable condition to his own reception into Romanism, is equally unlikely to have promoted any growth of good in Rousseau. We pass the details of his amour with Madame de Warrens, which are well known, as well as his

intercourse with Theresa, by whom he had five children, and whom he ultimately married, disposing of all his children, one after the other, in the Foundling Hospital. How strangely were the genuine affections of the earth extinct in the breasts of the men of that period! In 1749, Rousseau gained the prize on certainly an extraordinary subject for a literary institution, like the academy of Dijon, to propose, "The Mischiefs of Science." Rousseau rose into repute at first, however, more probably from his "Devin du Village," than any other cause. On his return to his native city, Geneva, Rousseau abjured Romanism, and became once more a citizen of Geneva. The spring of 1756, however, saw him again a resident near Paris, at Montmorenci. At this time the "Nouvelle Héloïse" appeared. On this work the remarks of Lord Brougham are judicious and sound:—

"It charmed many; it enchanted both the Bishops Warburton and Hurd, as we see in their published correspondence; it still holds a high place among the works which prudent mothers withhold from their daughters, and which many daughters contrive to enjoy in secret; it makes a deep impression on hearts as yet little acquainted with real passion, and heads inexperienced in the social relations; it assuredly has no great charms either for the experienced or the wise, and is alike condemned by a severe taste in composition and a strict judgment in morals."—p. 163.

As for the heroine of this unnatural work, we can only say that, thank Heaven, such women are rare, and that they are still rarer in modern days than heretofore. Julie was exactly what Rousseau wished the entire sex to be; and for this he would have repaid them with the tenderness he evinced to poor Theresa's offspring. The "Emile" was published in the spring of 1762, and the "Contrat Social" followed. In the "Emile" Rousseau attacked revelation, but he does not abuse it nor ridicule it. This singular man was doubtless in a degree insane; he had that remarkable peculiarity of insanity—the belief that all the world was in league against him. Our country was favored by his presence as well as Voltaire's, but with reverse conclusions. Voltaire liked the English, Rousseau hated them, in common with the rest of his foes and his brother infidel Hume, who lured him over especially. After a ten months' residence he returned to France. There is a curious opposition between the reverses of Rousseau, and the successes of Voltaire, in England. Rousseau himself says:—

"J'ai mis trop d'humeur dans mes querelles avec M. Hume; mais le climat d'Angleterre, la situation de ma fortune, et les persécutions que je venais d'essayer, tout me jetait dans la mélancolie."

After various migrations this strange being finally settled at Ermenonville. Six months before he died he sent out a circular, representing himself in an utter state of destitution, and entreating to be sent to an hospital. It is needless to say that the poverty he pleaded was a lie; and had any one taken him at his word, then, as our author justly remarks, he would have proclaimed him as the consummator of the plot that had been carried on against him over his entire existence. He died of apoplexy at Ermenonville. Me. de Staël hints at suicide, but this, however probable, is not substantiated. Those were glorious days for infidels, anarchists, and blasphemers. A pen-

sion of 1,500 francs was conferred on his widow, a creature of low habits, who lived to take her stand at the door of the theatre, and beg at eighty years of age. She died in 1801. Though outrageous common sense and just propriety, we allow that he was not an infidel of the pure encyclopædist school, and felt a shrinking horror of their open blasphemy. The truth was that Christianity addressed herself so deeply to his feelings, that he could not but mistrust his infidel conclusions; and this led to the sarcasm of Voltaire, that he was half a Christian. An epitaph on him, never yet published, written by Voltaire, is given by Lord Brougham; not that Voltaire outlived his rival, for he died in the May of 1788, and Rousseau in the July of that year:—

"Plus bel esprit que grand génie,
Sans loi, sans mœurs, et sans vertu,
Il est mort comme il a vécu,
Couvert de gloire et d'infamie."

These were kind people to each other: the benevolence of the "Esprits Forts" is remarkable.

It falls unhappily to our lot to say, that the third life in this biography is also an infidel writer—David Hume. This writer was born at Edinburgh, in April, 1711. Like Voltaire, he also was destined for the legal profession. On his refusal to embrace this, he was placed in a commercial house at Bristol, whence he retired to France, to prosecute his favorite studies of classic literature. At La Flèche, in Anjou, appeared the "Treatise on Human Nature," in 1737. After this, on his return to England, he accepted the post of companion to the imbecile Marquis of Annandale. This ill suited him, and he took the part of secretary to General St. Clair, in which occupation he was enabled to realize a thousand pounds, which was then a comparative independence. While in Turin, his "Inquiry concerning the Human Understanding" was published in London, a rifacimento of the "Treatise on Human Nature." The same year, "The Inquiry concerning the Principles of Morals" saw the light. All these attempts were eminently unsuccessful. Lord Brougham has drawn a great distinction with respect to Hume's writings. "They are," he says, "not purely skeptical but dogmatical." Thus on the important argument on Providence and a Future State, his lordship has the following just remarks:—

"The question, and none other equal in importance can exercise the human faculties, is, whether we have or not, by the light of nature, sufficient evidence to make us believe in a Deity and the Soul's Immortality. His argument is, not that there is any doubt on the subject, but that we have no such evidence; consequently his position must be that there is no ground for believing in a God or a future state. It is easy to say Mr. Hume was not an atheist; and that neither he nor any man can in one sense of the word be an atheist is certain. If by denying a God we mean believing that his non-existence is proved, there neither is nor can be an atheist, because there cannot possibly be conceived any demonstration of that negative proposition. To prove that a man asserted to be in existence, exists not, we must either show that he once existed, and has ceased to exist, or that he never existed, but more certainly the former than the latter, because the former alone can be considered to leave the proposition quite certain.

Now, clearly this kind of proof is inconceivable as to a Deity; consequently no man in this sense can be an atheist, if his understanding be sound. But we really mean by atheist as contradistinguished from skeptic, one who holds that there exists no evidence of a Deity, as contradistinguished from him who only entertains doubts on the subject—doubts whether there be evidence or no. Mr. Hume's argument, if solid, shows that there is no evidence, and not that there are doubts: consequently the inference from his argument is, not that we have reason for doubting whether or not there is proof, but that we have no proof, and, therefore, if consistent with ourselves, admitting his argument, we must not believe; that is, we must disbelieve. In the ordinary sense of the word, and as far as it is possible for the thing to exist, this is atheism, not skepticism. On miracles, no one has ever contended that the author's doctrine amounted only to skepticism. He does not doubt at all—he denies, and not only denies negatively that any miracle was ever proved by evidence, but affirms positively that none ever can be so proved. His whole argument goes to this; and between the impossibility of a miracle ever having been performed, and the total want of evidence of a Deity by the light of nature, we are left not to doubt, but to deny both Providence and a future state. The one argument shows supernatural evidence to be impossible; it shuts out light from above; the other shows natural evidence to be non-existent: it shuts out light from the world around us. The two together amount to plain and practical atheism, as far as such a belief is compatible with sanity of mind."

The Political Discourses of this writer have been always popular, and are not without great merit. In the year in which he published them, 1752, Hume was appointed librarian by the Faculty of Advocates at Edinburgh. This office furnishing the means of access to an admirable library, induced him to undertake a "History of England." He began by way of feeler for his grand design, with the "History of the Stuarts," in two vols. The second appeared in 1756. The opposition to the reception of the work is described by him in the following words:—

"I was assaulted," says he, "by one cry of reproach, disapprobation, and even detestation. English, Scotch, and Irish, whig and tory, churchman and sectary, freethinker and religionist, patriot and courtier, united against the man who had presumed to shed a generous tear for the fate of Charles I. and the Earl of Strafford."

The second volume, however, gave less offence than the first; and between the publication of the first and second, appeared his "Natural History of Religion." Bishop Hurd thought this production worthy of a reply. Three years after the publication of his second volume of the Stuarts, appeared the "History of the House of Tudor," in three volumes. This also from the view given of Elizabeth, raised no small clamor against him. But Hume found this did the sale good, and it brought him to competency fast, as a man of moderate desires. The profits of publishers in those days were not small. Lord Brougham informs us, that for his "History of Scotland,"—

"Dr. Robertson had only received 600*l.*, the publishers having cleared 6,000*l.* For 'Charles V.' he received 3,600*l.*, and for 'America,' 2,400*l.* (being in the same proportion,) while, no doubt, 50,000*l.* at the least must have been realized by those works."

Hume was certainly a rapid writer, and though we do not join in the recent invectives against him, he was undoubtedly often most inaccurate, and insufficient, and partial, independent of his Stuart bias—three charges of a strong kind against an historian; and to these may be added, though partially included in the above, a want of patient investigation, and an innate disregard of truth. The following remarks on his style are, however, strictly merited:—

"It is not surpassed by Livy himself. There is no pedantry or affectation, nothing forced or far-fetched. It flows smoothly and rapidly, according to the maxim of the critic, 'Currere debet et ferri.' It seems to have the 'lactea ubertas' of Livy, with the 'immortalis velocitas' of Sallust. Nothing can be more narrative; the story is unbroken, it is clear, all its parts distinct, and all succeeding in natural order; nor is any reflection omitted where it should occur, or introduced where it would encumber or interrupt. In both his narrative and his descriptions there is nothing petty, or detailed more than is fit or needful; there is nothing of what painters call spotty—all is breadth and bold relief. His persons are finely grouped, and his subjects boldly massed. His story is no more like a chronicle, or his views like a catalogue of particulars, than a fine picture is like a map of the country or a copy of the subject. His language is more beautiful and powerful than correct. He has no little tendency to Gallicisms. He has many very inaccurate, some ungrammatical phrases. In this respect he is far behind Robertson. The general effect, however, of his diction is unequalled. He cannot be said to write idiomatic English, being indeed a foreigner in that sense; but his language is often, nay, generally, racy, and he avails himself of the expressions, both the terms and the phrases, which he finds in older writers, transferring them to his own page. In this he enjoys a great advantage over Robertson, who, resorting necessarily to Latin, or to foreign or provincial authors, could not manage such transfers, and was obliged to make all undergo the digestive and assimilating process, converting the whole into his own beautiful, correct, and uniform style. Another reach of art Hume has attained, and better than any writer in our language; he has given either a new sense to expressions, or revived an old, so as never to offend us by the neology of the one process or by the archaism of the other. With this style, sustained by his profound philosophy, there can be nothing more beautiful than some of his descriptions of personal character, or of public feeling, or of manners, or of individual suffering; and, like all great masters of composition, he produces his effect suddenly, and, as it were, with a single blow."—p. 217.

When the publication of his history closed in 1761, he was 50 years old. At this period he accepted the office of secretary of the embassy to the British ambassador at Paris, Lord Hertford, and when the same ambassador went to Ireland as lord lieutenant, he was chargé-d'affaires part of the year. French society was much to his taste. He there met with no stern-minded Johnson, pointedly refusing, by his emphatic "No, sir," all introduction to England's first historian, and the *convenances* of society were there strictly attended to, and these are convenient for infidels. In 1766 he was under-secretary of state in General Conway's ministry, and returned to Edinburgh possessed of 1,000*l.* a year. While in Paris he had

there made the acquaintance of Rousseau, and induced him to come to England. In the quarrel between them, since Rousseau admitted, as we have seen, that he had been in fault, we may well believe him to have been so. Hume quarrelled with no man, from utter indifference to all. He resigned the office of under-secretary of state from ill health in 1769, when he returned to Edinburgh. In 1775 he was seized with a disease in the bowels, under which malady, however, he writes as follows:—

“ ‘I now,’ adds the philosopher, ‘reckon on a speedy dissolution. I have suffered very little pain from my disorder, and what is more strange, have, notwithstanding the great decline of my person, never suffered a moment’s abatement of my spirits; insomuch that, were I to name the period of my life which I should most choose to pass over again, I might be tempted to point to this latter period. I possess the same ardor as ever in study, and the same gaiety in company. I consider, besides, that a man of sixty-five, by dying, cuts off only a few years of infirmities; and though I see many symptoms of my literary reputation breaking out at last with additional lustre, I could have but a few years to enjoy it. It is difficult to be more detached from life than I am at present.’ ”

He further declared that he had no enemy, in his own *nonchalant* manner, except all the Whigs, all the Tories, and all the Christians.

Few persons have met death so unprepared and yet so easily as Hume. He died in the 65th year of his age; and Scotland has not been ungrateful to his memory. A conspicuous monument on the Calton Hill commemorates her historian. Of shades of infidelity Hume, however at times he may plead a lighter and less repulsive hue than either Voltaire or Rousseau, is still a dogmatizer on infidelity. Infidelity that shocks us in a Frenchman, both shocks and disgusts more strongly still in an Englishman; and though Lord Brougham thinks Johnson by no means an irreprouchable person, nor was he, yet look at the perpetual effort of his life, and that amid the tendencies of his age, and he becomes immeasurably superior to Hume. We allow his honest zeal for religion might do harm at times, but it also did essential, permanent, solid good to that cause. We have said that Hume varied from Voltaire and Rousseau in the character of his unbelief. We give Lord Brougham’s extenuation of his infidelity:—

“ ‘It is to be observed that the charges made against Mr. Hume for his skeptical writings, and for the irreligious doctrines which he published to the world, are in almost every respect ill-founded. He never had recourse to ribaldry, hardly ever invoked the aid even of wit to his argument. He had well examined the subject of his inquiries. He had, with some bias in favor of the singularity or the originality of the conclusions to which they led, been conducted thither by reasoning, and firmly believed all he wrote. It may be a question, whether his duty required him to make public the results of his speculations, when these tended to unsettle established faith, and might destroy one system of belief without putting another in its place. Yet if we suppose him to have been sincerely convinced that men were living in error and in darkness, it is not very easy to deny even the duty of endeavoring to enlighten them, and to reclaim. But it is impossible to

doubt that, with his opinions, even if justified in suppressing them, he never would have stood excused had he done anything to countenance and uphold what he firmly believed to be errors on the most important of all questions. Nor is it less manifest that he was justified in giving his own opinions to the world on those questions if he chose, provided he handled them with decorum, and with the respect due from all good citizens to the religious opinions of the state. There are but one or two passages in them all, chiefly in the ‘*Essay on Miracles*,’ which do not preserve the most unbroken gravity, and all the seriousness befitting the subject.”

Like Voltaire, the fearful bon-mots of his order, against religion—the ceaseless carcasms he unflinchingly poured forth against its adherents, cannot be too deeply reprobated.

Leland has refuted his “*Philosophical Essays* ;” his “*Providence, and a Future State* ;” the “*Essay on Miracles* ;” and the “*Principles on Morals* ;” and therefore the poison of these works is now to a great extent superseded by a powerful antidote.

Before we proceed to the next writer we beg leave to refer our readers to the specimens given in the appendix, of Hume’s corrections of style, by fac-simile extracts. They show the great care he took in composition; and that on his rhetorical passages he bestowed deep pains and high finish. We are enabled by Lord Brougham to contradict absolutely a statement in the “*Quarterly Review*” (vol. lxxiii., p. 556.) A very serious charge is there made against the ministers of Edinburgh—that they encouraged his scoffs at religion, and echoed his blasphemies. A mass of invective is also exhibited; the heavy terms, “*betrayers of their Lord*,” and many others, are launched against their devoted heads, and the case considered proven. To all this, Lord Brougham says:—

“ ‘I have caused minute search to be made; and on fully examining all that collection, the result is to give the most unqualified and peremptory contradiction to this scandalous report.’ ”

We now come to Robertson, a writer, whose fame is by no means on the increase; and to a certain extent this is justifiable. The writer who could give a “*History of America*,” without being enabled to read the untranslated “*Conquistadores*,” and any Spanish document, rather merited this partial neglect. Robertson was born at Borthwick, in Edinburgh, on September 19, 1721. His father was minister of the Scotch Kirk, in London Wall. He was a rigid Presbyterian, and exacted from his son a promise that he would never enter a play-house; a promise to which, from filial affection, Robertson strictly adhered. Whether the injunction was right or wrong, may be matter of question; but the general educational process with Robertson, produced the happiest results. He enjoyed the high advantage of two most excellent parents. Lord Brougham, from his relationship to Robertson, reaches, in this life, almost to grounds of argument from personal experience. We pass the boyhood of Robertson, and proceed to his university career, which began at twelve years old, and occupied him eight years. Lord Brougham says:—

“ ‘His diligence in study was unremitting, and he pursued his education at the different classes: for eight years with indefatigable zeal. He had’

laid down for himself a strict plan of reading; and of the notes which he took there remain a number of books, beginning when he was only fourteen, all bearing the sentence as a motto which so characterized his love of learning, indicating that he delighted in it abstractedly, and for its own sake, without regarding the uses to which it might be turned—*Vita sine litteris mors.* I give this gloss upon the motto or text advisedly. His whole life was spent in study. I well remember his constant habit of quitting the drawing-room both after dinner and again after tea, and remaining shut up in his library."

In 1741 he was licensed, by the Presbytery of Edinburgh, to preach; and afterwards appointed minister of Gladsmuir. In 1751, he married his cousin, Miss Nesbit. He soon became looked upon as the head of the moderate party, in the Assembly. We extract the following remarks on his preaching:—

"As a preacher he was most successful. His language, of course, was pure, his composition graceful, his reasoning cogent, his manner impressive. He spoke according to the custom of the Scottish Church, having only notes to assist his memory. His notions of usefulness, and his wish to avoid the fanaticism of the high church party, (what with us would be called the lower church, or Evangelical,) led him generally to prefer moral to theological or Gospel subjects. Yet he mingled also three themes essential to the duties of a Christian pastor. He loved to dwell on the goodness of the Deity, as shown forth not only in the monuments of creation, but the work of love in the redemption of mankind. He delighted to expatiate on the fate of man in a future state of being, and to contrast the darkness of the views which the wisest of the heathen had, with the perfect light of the new dispensation. He oftentimes would expound the Scriptures, taking, as is the usage of the kirk, a portion of some chapter for the subject of what is called *lecture* as contradistinguished from *sermon*; and in these discourses, the richness of his learning, the remarkable clearness of his explanation, the felicity of his illustration, shone forth, as well as the cogency and elegance of his practical application to our duties in life, the end and aim of all his teaching."

From 1753 to 1758, he had been occupied on his "History of Scotland;" it appeared in 1759, and met with a most cordial and well-merited reception. The portion connected with Mary, displeased the Jacobite party: but Robertson, who could not screen the queen from the marriage with her husband's murderer, a fact she herself avouched, certainly contrived to clear her of the accusations of taking part in Babington's conspiracy, and to render *her* share in Darnley's murder doubtful; he further entered into a general vindication of many other points in her favor; Lord Brougham, however, justly remarks, both Hume and Robertson omit to notice the most extenuating point connected with her death—the utter want of right, on the part of Elizabeth, to condemn her, in which we fully participate. But surely it cannot be concealed, that it was a question which sovereign should perish; surely it cannot be doubtful, after the massacre of St. Bartholomew, that Elizabeth's own position was most critical. Lord Brougham has few tendencies that lead him to favor deeply this great queen: and the following passage exhibits the full force of his own feelings:—

"A graver charge than dissimulation and severity as regards Mary is entirely suppressed, and yet the foul crime is described in the same work. It is undeniable that Elizabeth did not cause her to be executed until she had repeatedly endeavored to make Sir Amyas Paulet and Sir Drue Drury, who had the custody of her person, to take her off by assassination. When those two gallant cavaliers rejected the infamous proposition with indignation and with scorn, she attacked them as 'dainty' and 'precise fellows,' 'men promising much and performing nothing;' nay, she was with difficulty dissuaded from displacing them, and employing one Wingfield in their stead, 'who had both courage and inclination to strike the blow.' Then finding she could not commit murder, she signed the warrant for Mary's execution; and immediately perpetrated a crime only less foul than murder, treacherously denying her handwriting, and destroying by heavy fine and long imprisonment the secretary of state whom she had herself employed to issue the fatal warrant. History, fertile in its records of royal crimes, offers to our execration few such characters as that of this great, successful, and popular princess. An assassin in her heart, nay, in her councils and her orders; an oppressor of the most unrelenting cruelty in her whole conduct; a hypocritical dissembler to whom falsehood was habitual, honest frankness strange—such is the light in which she ought to be ever held up, as long as humanity and truth shall bear any value in the eyes of men. That she rendered great services to her subjects; that she possessed extraordinary firmness of character as a sovereign, with despicable weakness as an individual; that she governed her dominions with admirable prudence, and guided her course through as great difficulties in the affairs of the state, and still more in those of the church, as beset the path of any whoever ruled, is equally incontrovertible; but there is no such thing as 'right of set-off' in the judgments which impartial history has to pronounce—no doctrine of compensation in the code of public morals; and he who undertakes to record the actions of princes, and to paint their characters, is not at liberty to cast a veil over undeniable imperfection, or suffer himself like the giddy vulgar to be so dazzled by vulgar glory that his eyes are blind to crime."

Is it not remarkable, then, if this powerful passage be as true as it is forcible, that writers like Hume and Robertson should give so different a verdict on the character of Elizabeth, when all their tendencies ran in opposite directions?

A few months previous to the publication of the "History of Scotland," Dr. Robertson, as he was then styled, having received his degree of D. D., from the University of Edinburgh, removed to that city, being presented to the Kirk of the Old Gray Friars. In 1762, he was appointed Principal of the University, and Lord Bute requested him to write the "History of England." The termination of Lord Bute's short ministry probably led to the abandonment of this undertaking. He was, however, appointed historiographer for Scotland in 1764. We regret that this work was not achieved by him. He had stipulated to finish his "Charles V." anterior to it. The "History of America" came out ten years after his "Scotland;" a work for which, in spite of his allowed graphic descriptions, extensive research, and beautiful style, he was much less qualified than for a "History of England,"

where he was enabled to inspect most of the sources, and might have filled up with some small study even many of Hume's short-comings over the Anglo-Saxon period. Lord Brougham embraces the opportunity afforded by a dissertation on these histories, to possess the public with his own notions of the really valuable plan on which history should be written. He considers most historians, and with great truth, as holding up false principles. The following remarks, not the least important of which is the revelation of Lord Brougham's own unpublished attempts, are highly valuable :—

“To the historians of all ages joining with the vulgar, and, indeed, writing as if they belonged themselves either to the class of ambitious warriors and intriguing statesmen, or to the herd of ordinary men whom successful crimes defrauded at once of their rights and their praises, may be ascribed by far the greater part of the encouragement held out to profligate conduct in those who have the destinies of nations in their hands. At all events, this is certain: if they could not eradicate the natural propensity in the human mind towards these errors when unrefined, they might have enlightened it, and have gradually diffused a sounder and better feeling.

“So deeply have I always felt the duty of attempting some such reformation in the historical character and practice, that I had begun to undertake the reigns of Henry V., of Elizabeth, and of Alfred, upon these great principles. A deep sense of the inadequate powers which I brought to this hard task, would probably have so far grown upon me as its execution advanced, that I should have abandoned it to abler hands; but professional, and afterwards judicial, duties, put an end to the attempt before it had made any considerable progress. Nevertheless, I found no small reason to be satisfied of success being attainable, when I came narrowly to examine the interesting facts connected with national improvement and virtuous conduct; and I am sure, that whoever may repeat the attempt will gather encouragement from the proof, which I have drawn from the masterpieces we have been contemplating, that the events and characters of past times lend themselves to an affecting narrative, conducted on right principles.”

The last work brought under consideration is the “Disquisition on India.” Undoubtedly an able and learned inquiry. In 1791, his health began to fail him; in 1793, his recovery was hopeless; on the 11th of June in that year he died. The summary of this amiable man's life and character we will not injure Lord Brougham's work by extracting, but refer our readers to the book. It is most complete and satisfactory. The reminiscences of a relation—of whom, were Robertson living, he might well be proud, from his multiform acquirements and mental grasp—were always affecting, and we subjoin them :—

“The only particulars of his manners and person which I recollect are his cocked hat, which he always wore, even in the country; his stately gait particularly in a walk which he loved to frequent in the woods at Brougham, where I was never but once while he visited there, and in which he slowly recited sometimes Latin verses, sometimes Greek; a very slight guttural accent in his speech, which gave it a peculiar fulness; and his retain-

ing some old-fashioned modes of address, as using the word ‘madam’ at full length; and, when he drank wine with any woman, adding, ‘My humble service to you.’ When in the country he liked to be left entirely to himself in the morning, either to read, or to walk, or to drive about; and he said that one of his great enjoyments at Lennel was Mr. Brydons and himself doing precisely each as he chose, and being each as if the other were not in the same house.”

We regret that both time and want of space prohibit our reverting to the exquisite description, from personal recollection, of Black, the great pillar of modern chemistry. The discoveries of Black on heat, contributed undoubtedly to clear the way for Watt in the invention of the steam-engine. The account given of the progress of this philosopher, is fraught with the highest interest, and as clear as it is beautiful. The reminiscences of him, and the large quantity of new materials that enter into this life, will excite great interest. He also, as well as Black, was the personal friend of Lord Brougham. A very valuable historical note, “On the Discovery of the Theory of the Composition of Water,” follows this biography. We pass Priestley, who is well known to the public from other sources; and we must say little more of Cavendish, the undisputed discoverer of nitrous acid, and of the composition of water, independent of Watt—a philosopher who applied his splendid fortune and ducal descent to as splendid and noble discoveries. Like Wollaston, this singular man even watched with curious observation the progress of disease and the gradual extinction of his own vital powers. On Davy, the inventor of the safety-lamp a name omitted in the previous summary at the head of this article—we regret to say, we can do no more than refer our readers to the succinct details in this work. Simson, the mathematician, is the last. Some beautiful remarks are made in this life, on the gradual extinction of the ancient geometry of which Simson was so great a master. No one more regretted this than the great mathematician, whose system has superseded, by analysis, the geometric method. In mathematics Lord Brougham is not only a student, but very early in life, unless our memory fails us, himself published a work on Porisms, of which Simson was so great a master. The labors of Simson on Pappus will be read with interest by all mathematicians, and a few specimens of analysis necessary to such a biography are adduced. It is satisfactory also to trace the deep and affecting piety of this distinguished geometer. D’Alembert, and many others of his class, have exhibited opposite sentiments, and the common mathematical turn of mind is in general cold and unimaginative. It is quite delicious to light on such opposites to this school as Simson and Newton. Here we close our pleasing task; and we have to thank Lord Brougham for a work composed in the best spirit and feeling, full of matters of high scientific excellence, written with vigor and elegance, well balanced so as neither to shock religion nor morality, but on the contrary so cautiously framed as to base a clear necessity for Christianity even on the lives of infidels, and to educe from almost antagonistic principles the eternal truths of Exalted Reason and of Holiest Revelation.

DWELLINGS FOR WORKPEOPLE.

At the new port of Birkenhead, which is rising up to be a great town before our eyes, a practical experiment is in progress, highly interesting to the working-classes. The town is planned on a liberal and foreseeing view, so as to avoid the sources of discomfort and ill-health which affect those cities that grow up by haphazard—with well-arranged streets, public grounds, and a complete system of drainage. To the place have been brought large flocks of workpeople, for whom it has been necessary to provide dwellings; and in doing this for their workmen, the Birkenhead Dock Company have seized the opportunity of dealing with the matter in so complete a way as to make a model for others to follow. They have taken into account the cost, the profit to the owner, the comfort of the inmates, and the general comfort of their neighbors. They have found it a better economy to build large houses rather than cottages; they have adopted a plan prepared by Mr. Charles Evans Lang, of London; and the buildings are now in progress. The ground which they are to occupy lies between two of eight streets that meet in a circus, and may be described as a triangle; across which, from street to street, houses are erected in rows, with alleys between; there is a school-house at the apex of the triangle, and in the centre of the circus a handsome church. Each row resembles what in Scotland is called a "land,"—a pile four stories high, comprising several distinct houses, each house having a public staircase communicating with the several "flats" or stories; each flat divided into two separate dwelling places. Each dwelling contains a "living-room," two bedrooms, and a "yard." The living-room is capacious, and well arranged for ventilation and comfort: on one side are the entrance-door and the door into the yard; on the next side, near to the entrance, are the doors into the two bed-rooms; on the third side, opposite to the bed-room doors, is the window; and on the fourth side is the fireplace: nearly the half of the room, towards this fourth side, is left without any door or other opening, so that the hearth is removed from direct draughts. In this room there is a gas-pipe, for light. The "yard" is a sort of scullery, but comprising the sink, coal-hole, dust-hole, &c.; in short, all the "domestic offices," packed into a very close space, but fitted with conveniences not always found even in the houses of the middle-classes. Up the whole height of the building is a shaft, with which pipes from each yard communicate; at the top is a cistern with a preparation for keeping it full, to the extent of one thousand gallons of water; from which, independently of individual use, a stream can be at pleasure made to rush down the shaft, carrying away the *ejaculanda* into the sewer, into which the shaft runs below. There is in that respect the most complete means for securing tidiness, decency and health. The independent run of water will be a guard against many of the evils even of individual negligence; but it is inconceivable that with such conveniences the humble tenants should not acquire the better habits that await an opportunity. At the top of the building is an "airing flat," in which all the families whose dwellings open into the common staircase will have the right to dry their clothes. There is, we believe, some means of regulating the temperature of the whole pile

of buildings: at all events, there are appliances to secure thorough ventilation; and the whole structure is fire-proof. The external aspect of these dwellings for the poor is handsome, and even imposing; in a style so ornate as quite to relieve them from the aspect of almshouses; to which, indeed, they bear no sort of resemblance. Now it is calculated that this kind of house-property will "pay," even as a commercial speculation: with all this convenience, salubrity, and comfort for the tenant, and let to him at the rent which he usually pays—the landlord, too, settling all rates and other charges, so that the tenant will pay for the whole house, its gas-light, water, taxes, rates, and all, one fixed weekly charge—with all these unwonted comforts and facilities, the tenant paying no more rent than he is used to pay for bad lodging elsewhere, the landlord will yet reap a profit of 8 or 10 per cent on the capital invested. In the present instance, that is not the whole advantage derived by the landlords, the company; for they will find great immediate convenience in the concentration of their workpeople, and great benefit may be expected by all who have a stake in the town from the improved salubrity and the high character which these far-seeing plans must secure for it. The experiment may prove to the speculative builder, that he could provide for the humbler classes a very superior kind of accommodation at a profit to himself; it may teach those classes what they should obtain for their money.—*Spectator*.

FEARFULLY AND WONDERFULLY MADE.

WOMBWELL's exhibitor used to remark of the elephant's trunk that it was adapted to unroot oaks or pick up a pin. Civil engineering appears to embrace an equal multiplicity of objects. At the last meeting of the Institution of Civil Engineers, a new patent machine for the manufacture of teeth, gums, and palates, was exhibited alongside of railroad and locomotive models, and (deservingly) much admired. It is pretty generally known that the loss of the organs just enumerated is not unfrequently supplied by artificial imitations; but the description of the process by which the imitations are formed and inserted goes further to place the human body on a footing of equality with machines than the mere abstract knowledge. A cast of the mouth is first taken in the usual way, to obtain an exact counterpart of the inequalities of the inside: the space intervening between two vermeil lips may be clogged up with plaster of Paris as a preparative to restored beauty. Art does not stop here in its power to replace mutilated or decayed members. Legs and arms of exquisite proportion and finish—to say nothing of swelling, caudal appendages sacred to the use of the fair sex—meet the eye in every street. In the vicinity of Temple Bar, a placard in a shop-window informs the passer-by that "artificial eyes of peculiar *clearness and vivacity of expression*," are to be had there. The thriving appearance of all these decorative artists tempts people at times to question whether any person they converse with is entirely human. The whole population seem akin to the enchanted prince in the *Arabian Nights*—upwards flesh and downwards marble. When the police pick up a lady or gentleman knocked down by an over-driven cab, they must feel puzzled whether to carry the body for repair to the surgeon, the mechanist or the civil engineer.—*Spectator*.

From the Law Magazine.

THE LATE MURDERS.

MURDERS in England, until recently, were usually the offspring of the fierce and deadly passions, goaded and wrought upon by wrongs, real or fancied, and overbearing reason and mercy in obedience to the impulses of hatred, malice or revenge, or to the promptings, scarcely less powerful, of avarice or want. It has ceased to be so. Crime now clothes itself with a calmness and tranquillity of character, deliberate in inception and reckless in execution to an extent foreign to the worst phases of English vice. Murders are now motiveless: not only are they rank with treachery and diabolically brutal, but they seem to spring up from pure love of blood. Three fourths of the cases tried are unprovoked—cool, placid, passionless murders! The nearest relative, or the dearest friend of the victim, is usually the murderer. The circumstances of the act and the atrocity of its perpetration, are generally rank in proportion to the absence of object and provocation. We desire, very briefly, to direct investigation and thought to the subject. We revolt from the task of filling our pages with a record of the villainies of life, and shrink from a further detail of recent murders than is forced upon us by the due fulfilment of the duty of probing the matter with a view to advance the removal at least of the removable causes of this great and very growing evil.

I. The first cause to which we attribute the growth and atrocity of murder is the deficiency of sound and religious education for the great mass of the people most exposed to vicious influences—a subject alien to the province of a review of jurisprudence.

II. The next great proximate cause is the publication, in all their prurient and debasing details, of the foulest and bloodiest outrages. It is matter of notoriety that the publication of these horrors is invariably followed by a fresh crop of crime. It has been the case with nearly every one of the "great murders" of the last ten or fifteen years, from Sheen to Hocker. It is needless to enter upon the somewhat metaphysical inquiry of *how* this is; it suffices to our present purpose that it is so; and that so it is universally admitted to be.

We are scarcely prepared to say that trials of all debasing crimes should be conducted in private, but we believe that we could adduce more arguments in favor even of so extreme a resource, than it would be easy to find reasons to counterbalance. Clear it is that so long as the low taste infused in the public mind, especially of that most brutalized portion of the people who inhabit the metropolis, seeks for its gratification in the public prints, it is not to the scruples of their proprietors that we can look for a remedy to the evil! We are greatly inclined to question whether the publication of a certain class of trials ought not to be repressed by means similar to the laws which prevent the exhibition of obscene prints. What is the difference in principle? The one is on the ground of protecting the public mind from impurities which pollute it—the other from atrocities which render it criminal, and expose society to fresh outrage. So cormorant of horrors is the public become, that they who pander to its morbid palate, literally regard the supply of it as a branch of public service, to which it is their duty and privilege to administer. It was represented as a vast griev-

ance that some of the emissaries of these prints were debarred from witnessing and gloating on the last moments of Tawell in his agony of prayer and terror, in order, they said, that "public anxiety might be satisfied." Public anxiety, forsooth! Anxiety for what? That justice should be done? No; for that was sufficiently made known by the fact that the murderer was hanged. Anxiety that his fate should be appreciated by others? This was accomplished by his execution and confession. If anxiety were for any good purpose, it might well be gratified; but the anxiety in question is that of a vampire taste to batten upon the acts, looks and words of dying men, in whom a prurient interest is excited by the very rankness of their villainies. In fact, people now feed on murders precisely like a tragedy, only with keener zest, because they are more filthy and horrible. These accounts now constitute the romance reading of a large portion of the middle and lower classes in London and large towns; they supply garbage of the same kind, only infinitely more coarse and depraving, than that formerly sought for, but more scantily supplied by the Radcliffe romancists and the penny press, whence the author of Jack Sheppard afforded the public appetite an easy transition from fiction to fact—from fancy felonies and imaginative murders to the racier realities of outrage and bloodshed, decked by the newspapers with those interesting minutiae in which the Newgate calendar is unhappily deficient.

We believe these newspaper details to be rife with the seeds of mental debasement, and that a taste for crime is thus generated and diffused through the land. "L'appetit vient en mangeant." The public mind is now thrice fed with every murder; the full detail, and all the horrible incidents, are paraded three times over in all the newspapers of London: the revolting drama is performed three distinct times at three different theatres—the coroner's court, the police court, and the Old Bailey. The coroner and the magistrates are now engaged in a desperate conflict which shall have the murderer before them: they struggle for the exhibition of him with a zeal which would do credit to the competition of rival managers for a prima donna! The murderer is of course caught in nine cases out of ten by the police, and they and the magistrates claim him as their own; the coroner avers that he cannot receive evidence implicating the prisoner without he is present. Now whether it be a necessary function of a coroner to inquire into the guilt of the prisoner, and virtually to try him, and whether it be also equally necessary that he should be personally present—or whether (seeing that at a very recent adjournment of the court for three weeks, the prisoner might have been tried, condemned and hung before the coroner had arrived at a verdict at all) it be anything more than an idle ceremony for coroners to sit in judgment on murderers—are matters into which inquiry may hereafter be advantageously made. It is enough for our purpose to point to the fact, that the publication of matter admitted to be injurious in the highest degree to the morals of the people is thus doubled: at the same time we apprehend that few persons out of a coroner's court will for a moment pretend that these investigations tend in the smallest degree to the furtherance of justice. The coroner's chief, if not his only office, is to find out how and where the deceased came to his death: it is the province

as well as to secure re-admission as a Quaker, (an honor he had previously forfeited when transported for forgery,) prevails upon the woman to go into seclusion for his sake, and become dead even to her own family and the world: to this she generously consents: he allows her an income of 50*l.* per annum, which he pays irregularly; on the last visit to her, he asks her to be alone when he next calls to bring her the money, naming the day of the murder: the day previous to which he purchases prussic acid from a chemist. On the afternoon of the day of the murder, he informs a waiter at a tavern that he is going to dine out in town; in the course of the evening Sarah Hart, who resides at Slough, is seen bringing a bottle of porter to her lodging, because "her friend she says is come to see her;" a few minutes after, moans are heard in her house; a neighbor alarmed goes to see what is the matter, and at the wicket gate meets a man whom she afterwards identifies as Tawell; he is agitated; he can scarcely undo the gate; when asked what is the matter with Mrs. Hart, he makes no answer, but hurries away; he is seen by clear memoried witnesses going first to the station, then back to Herschel House, then again to the station, and thence to London by the railway. Meantime Sarah Hart is found on the floor dying; a bottle half filled with porter and two glasses are standing on the table; water is attempted to be given to her, in vain; she dies; she is opened, and prussic acid, by certain tests, found in her stomach, together with porter and apple, but no apple pips. A telegraphic despatch precedes John Tawell to London; he is followed by the police. The next day he goes again to the chemist for more prussic acid, saying he had broken the bottle and lost the last he bought; he is then apprehended, and first denies that he was at all at Slough on the day of the murder; he then consults with counsel, and confesses he was there—that Sarah Hart had pestered him for money—that she was a bad woman, and that he had refused to give her more; on which she suddenly poured something into the porter and drank it off—that he believed she was only pretending to have poisoned herself, and he came away; every search is made, and no phial is found which could have contained the prussic acid he alleged she took. This was the evidence against John Tawell, shaken in no one single point. What was the defence of Mr. Kelly?

This: The report in the Times informs us that Mr. Kelly "commenced his speech in defence of the prisoner, appearing to be much affected, *for tears stood in his eyes* as in a low tone he declared that he rose," &c., and then apologized for betraying a "momentary weakness." Tears were the first attack on the sensibilities of the jury. But Mr. Kelly has not done crying. He reads a letter from the *wife* of Tawell, a letter written before the occurrence, on new year's day—one full of ordinary chat about the produce of the twopenny post, the names of the visitors who called at the house, and that Sarah invited Eliza to dine off turkey, beginning and concluding with expressions of endearment quite as ordinary from a wife to a husband whom she had no reason to suspect to be a murderer; whereupon Mr. Kelly cries again! "The learned counsel (says the reporter) shed tears once or twice while reading this letter, and then proceeded to say, that no man could receive such a letter as that, and do an act, which would make his affectionate wife a widow, and his chil-

dren fatherless!!!" That is to say, that a man capable of being a murderer could by no possibility be a hypocrite also, and have beguiled his wife into a belief that he was worthy of her affection! The crying has been condemned as the weakest part of the defence. We think it incomparably the strongest. The Aylesbury jury melted like their own butter. Never were tears more impressive on the minds and logic of yeomen. How could that man be guilty of murder whose counsel's

"grief

Bears such an emphasis? Whose phrase of sorrow

Conjures the wandering stars and makes them stand

Like wonder-wounded hearers!"

Mr. Kelly had doubtlessly read, in the memoir of Lord Abinger, in this magazine, how a sympathetic jurymen held out because he could not bring himself to believe that the counsel for the defendants could shed *real tears* if he thought them guilty. A barrister who was present assures us that though he did not see Mr. Kelly cry, he can vouch for it that his junior, and a witness for the prisoner, sobbed in chorus. The tears washed down the defence, which it certainly would have been somewhat difficult to swallow dry. It consisted, first, in the suggestion that Sarah Hart was suffocated by the water given to her; and secondly, that she was not; but that she was *poisoned* by apple pips, which, Mr. Kelly assured the jury, might of themselves produce prussic acid; and so they certainly might, two conditions *only being* essential to it—first, that Sarah Hart should have swallowed apple pips, and secondly, that the human stomach should perform the process of distillation. Unfortunately neither of these conditions existed. Mr. Kelly also contended that the surgeon who had not previously seen death produced by prussic acid was incompetent to speak to its effect: no attempt being made to show that he was incompetent to speak to its existence in a quantity sufficient to cause death. Mr. Kelly is an orator of no mean order, and never were twelve men of Bucks more vigorously stormed with the artillery of appeal. We repeat it, the defence, such as we have briefly sketched it, was, we are well assured, well nigh successful. We can perfectly believe it. Fortunately it was sufficiently irrational to vanish before the reflection of a night's rest and the vigorous restorative of judicial comment. But supposing that the defence taken, instead of contradicting Tawell's own statement, had followed and fortified it! Suppose a vivid picture had been drawn of the probability of sudden suicide by a woman outraged by the prospect of abandonment, in presence of the accused, with none to witness his innocence, and every attendant circumstance to ensure and feed suspicion that the act was his: he as a chemist must have known her recovery hopeless, and humanity would have afforded no motive to stay his flight. True it is that a wise discretion would forbid flight and suggest the prudence of the course which Mr. Barrow Parke thought it some proof of guilt the prisoner did not adopt.* But does every man exercise the

* His lordship said that if Tawell's story were true, "one would suppose that instead of walking away from the house and denying he had been there at all, he would have waited to see if the deceased really had taken poison, and be the first to call for assistance." This is true.

wisest discretion in all emergencies and at times of violent emotion? And what more likely to dispel discretion and to induce the rashest act in the most innocent man, than a sudden and violent death before his eyes, with the horror of a charge of murder, against which no means of disproof exists? It is not very long since, we learn, that this case occurred. A man visited his mistress, who had fallen into habits of intoxication, after many warnings, to take a final leave of her. She retired for a moment, and returning, told him she had poisoned herself with laudanum. He disbelieved her, but fancying shortly after that he perceived her becoming drowsy, he rushed to a chemist, who brought a stomach-pump and discharged enough laudanum to have killed three women. She being restored, avowed her act: but supposing the woman had chosen the more fashionable resource of prussic acid, and, like Tawell, the man had happened to have an interest in her death, and that this, together with the apparent facility of his escape by flight, had flashed on his mind, and overcome discretion, might not his imprudence have hanged him in spite of his innocence? This defence, added to the proofs of Tawell's character and the inadequacy of the motive to murder, would in all human probability have balked justice in his case. We present this line of defence, not for its strength, but to show how easily a plausible fallacy might triumph over the common sense of juries, especially where the accused has added the accomplishments of a hypocrite to the villany of a murderer, and given opportunity to counsel to weep over his virtues with all the most approved "forms, modes, shows of grief, the trappings and the suits of woe." Let juries beware!

There are few things more difficult of attainment in England than justice for murderers with due mercy to society. Sometimes the judge, and often juries, acquit, and where both chances for the murderer fail, government occasionally steps in to aid escape. Dalmás and Stolzer are instances of the latter mistake, where the only pretext for mercy had been negated by the test imposed. In the case of Reg. v. Crouch, tried last year in London, of a husband savagely murdering his wife, the madly merciful of the jury were compelled to a verdict of guilty by sheer starvation, after being locked up for eighteen hours, the sole evidence for the defence being an occasional singularity of manner in the man. In the recent case of Tapping, who shot his sweetheart because she walked home with another man from a ball, there was no possibility for mercy, and the verdict was right. In that of Hocker, the jury displayed a very laudable discretion and firmness: for though the defence set up by the prisoner, who took the case out of the hands of his counsel, was not such as ought to have imposed even on a barrister of two years' experience in the tests of evidence, it was sufficiently plausible to have satisfied the consciences of most juries, and drew from the learned judge who tried the case expressions in favor of the prisoner, which, if they had been so disposed, would have given at least a pretext for an acquittal. We attribute their firmness in some measure to the matchless audacity of the prisoner's demeanor. His self-possession was carried to effrontery. We understand that no parallel to it is remembered at the Old Bailey.

ous; there could be no doubt of death, and no use in assistance.

We have adverted only to some of the main causes of a growth of crime, to an extent to which in the worst times this country has heretofore been happily a stranger. Whilst we write an execution is taking place, which adds another instance to the frequency of murders without motives!

Sarah Freeman was convicted at Taunton for poisoning her brother, by putting arsenic into a her-ring, there being every reason to believe that she had previously dispatched her husband, mother, and child. After the first poisoning the prisoner heard that her brother was likely to recover, after suffering great agony, and she then gave him a second and fatal dose in some gruel. The alleged cause of this murder is supposed to have been a grudge, because the brother objected to his sister's being in his father's house, although she had gained her object. Her former murders were for equally trivial reasons, and not the slightest doubt exists of her guilt in any of the former cases. At the preaching of the condemned sermon, she alone of the whole congregation appeared unmoved. She asserted her innocence, and was angry at being urged to confess!

Two other horrid charges of murder, one of a child by its mother, and another of a mother by her son, both attendant with almost incredible brutality, are for trial at the next assizes.

The return of the criminal offenders for 1844 is not yet published. It will afford us an opportunity of recurring to this subject in our next number. In the mean while we may be allowed to express our satisfaction, that our former notice of the subject was in some measure the means of bringing it under the notice or parliament.* It is in truth a matter which no Christian government or country can regard with indifference.

From Chambers' Journal.

EL COLL DE BALAGUER.

A MODERN CATALANIAN STORY.

THE road from Barcelona to Valencia passes over the skirt of a cordillera, or mountain ridge, known by the name of El Coll de Balaguer. This road is edged by the sea on one side and the Coll on the other; and at one point especially, where there is an elbow or short turn, there are several enormous blocks of stone, which appear to have become detached from the main rock, and to have lodged in situations exactly suitable for the concealment of banditti, and affording facilities for pouncing upon the unsuspecting traveller from the narrow passages by which they are separated.

Between the years 1828 and 1831, several robberies and assassinations had been perpetrated close to this spot; and six rude crosses, erected within a very short distance of each other, were sad mementos of the fact. All these murders had been accompanied by circumstances marked by a singular similarity. The first victim who perished in this dreaded neighborhood was a rich merchant, who was travelling from Lérida to Tortosa. It was supposed that, having had occasion to transact business in places out of the direct road, he had branched off, and had joined the Barcelona route near the Coll de Balaguer. He was seen one afternoon riding along on his mule in that direction, and early on the following morning a mendicant friar found his dead body, bathed in blood. A

Dalmás and Stolzer are instances of the latter mistake, where the only pretext for mercy had been negated by the test imposed. In the case of Reg. v. Crouch, tried last year in London, of a husband savagely murdering his wife, the madly merciful of the jury were compelled to a verdict of guilty by sheer starvation, after being locked up for eighteen hours, the sole evidence for the defence being an occasional singularity of manner in the man. In the recent case of Tapping, who shot his sweetheart because she walked home with another man from a ball, there was no possibility for mercy, and the verdict was right. In that of Hocker, the jury displayed a very laudable discretion and firmness: for though the defence set up by the prisoner, who took the case out of the hands of his counsel, was not such as ought to have imposed even on a barrister of two years' experience in the tests of evidence, it was sufficiently plausible to have satisfied the consciences of most juries, and drew from the learned judge who tried the case expressions in favor of the prisoner, which, if they had been so disposed, would have given at least a pretext for an acquittal. We attribute their firmness in some measure to the matchless audacity of the prisoner's demeanor. His self-possession was carried to effrontery. We understand that no parallel to it is remembered at the Old Bailey.

ous; there could be no doubt of death, and no use in assistance.

We have adverted only to some of the main causes of a growth of crime, to an extent to which in the worst times this country has heretofore been happily a stranger. Whilst we write an execution is taking place, which adds another instance to the frequency of murders without motives!

Sarah Freeman was convicted at Taunton for poisoning her brother, by putting arsenic into a her-ring, there being every reason to believe that she had previously dispatched her husband, mother, and child. After the first poisoning the prisoner heard that her brother was likely to recover, after suffering great agony, and she then gave him a second and fatal dose in some gruel. The alleged cause of this murder is supposed to have been a grudge, because the brother objected to his sister's being in his father's house, although she had gained her object. Her former murders were for equally trivial reasons, and not the slightest doubt exists of her guilt in any of the former cases. At the preaching of the condemned sermon, she alone of the whole congregation appeared unmoved. She asserted her innocence, and was angry at being urged to confess!

Two other horrid charges of murder, one of a child by its mother, and another of a mother by her son, both attendant with almost incredible brutality, are for trial at the next assizes.

The return of the criminal offenders for 1844 is not yet published. It will afford us an opportunity of recurring to this subject in our next number. In the mean while we may be allowed to express our satisfaction, that our former notice of the subject was in some measure the means of bringing it under the notice or parliament.* It is in truth a matter which no Christian government or country can regard with indifference.

From Chambers' Journal.

EL COLL DE BALAGUER.

A MODERN CATALONIAN STORY.

THE road from Barcelona to Valencia passes over the skirt of a cordillera, or mountain ridge, known by the name of El Coll de Balaguer. This road is edged by the sea on one side and the Coll on the other; and at one point especially, where there is an elbow or short turn, there are several enormous blocks of stone, which appear to have become detached from the main rock, and to have lodged in situations exactly suitable for the concealment of banditti, and affording facilities for pouncing upon the unsuspecting traveller from the narrow passages by which they are separated.

Between the years 1828 and 1831, several robberies and assassinations had been perpetrated close to this spot; and six rude crosses, erected within a very short distance of each other, were sad mementos of the fact. All these murders had been accompanied by circumstances marked by a singular similarity. The first victim who perished in this dreaded neighborhood was a rich merchant, who was travelling from Lérida to Tortosa. It was supposed that, having had occasion to transact business in places out of the direct road, he had branched off, and had joined the Barcelona route near the Coll de Balaguer. He was seen one afternoon riding along on his mule in that direction, and early on the following morning a mendicant friar found his dead body, bathed in blood. A

* See the powerful speech of Lord Ashley, M. P., in the House of Commons, on the 18th Feb., 1845.

bullet had struck him in the forehead, just between the eyes. His money and other light valuables were gone; but the assassin appeared to have desisted to take any other part of his property, for his mule was quietly cropping the scanty grass a short distance off, and the little portmanteau was still strapped on the crupper pad. A remarkable as well as unaccountable circumstance attending this catastrophe was, that a roughly-fashioned wooden cross had been placed in the clasped hands of the murdered merchant. The most prompt and diligent steps were taken, under the direction of the authorities, for the discovery of the assassin, but without effect.

Seven months afterwards, on the eve of the festival of San Hilarion, in the month of October, a dealer—who had been to Barcelona to dispose of a large quantity of Segovia wool, and who was on his way to Murcia with a considerable sum of money in his possession—was robbed and murdered near the Coll de Balaguer; and about the middle of the following year, Don Andres Escorriass, a manufacturer of fire-arms, was found dead at the same place.

In February, 1830, a pedlar named Zoannofer, who had been selling his wares in different parts of the country, commencing his traffic in Navarre and ending in Catalonia, when on his road from Barcelona to Tortosa, in order to return to the north by one of the passage-boats which ascend the Ebro, was also killed by a bullet near the fatal spot; and eight days before the festival of Todos los Santos, or all-Saints, in the same year, Antonio P. Dirba, a contrabandista, and also a great sportsman, who had that very morning succeeded in smuggling a cargo of French tobacco on that part of the coast, was assassinated, evidently without having had an opportunity of defending himself; for the *trabuco* or blunderbuss, with which he was armed, was still loaded, and lying beside his corpse.

In January, 1831, the dead body of a person named Nervas y Alaves, who had been selling a lot of liquorice juice at Tortosa, was discovered at El Coll de Balaguer.

These six victims had all been rifled of their money alone, and all had been mortally struck with equal good aim by a single bullet. Moreover, each was found with a rough wooden cross fixed in his lifeless hands.

The Coll de Balaguer became, as may naturally be supposed, the terror of travellers, as well as of the surrounding country, in consequence of these murderous waylayings; and few persons had the hardihood to travel by that route, unless they were numerous and stoutly accompanied. Many whose affairs called them from Barcelona to Tortosa and Valencia, diverged from the high road, and willingly encountered the toil and inconvenience of making a circuit of several leagues over rugged paths, regaining that high road at a safe distance from the dreaded Coll de Balaguer.

Some goat-herds, who had occasionally conducted their flocks to browse upon the mountain herbage near the spot, declared that they had found some faded flowers which had been deposited by an unknown hand at the foot of each of the six wooden crosses which marked the burial places of the murdered travellers, and they went so far as to add, that at sunset they had more than once descried a tall figure enveloped in a cloak gliding along until it arrived close to the crosses, when it sank on its knees, and appeared

absorbed in prayer; but that upon their approach, it suddenly vanished. They also imagined that they had occasionally heard doleful groans and sobs, apparently proceeding from some person in grief or suffering, at the foot of the Coll. Under these mysterious circumstances, he would have been a bold man who would venture to pass that spot alone after nightfall.

A few years antecedent to these startling events, a person named Venceslas Uriarte took up his residence in the environs of Tortosa. He was not a Catalonian, and his previous history was unknown in those parts. It was rumored, however, that before the revolution of 1822, when the Inquisition was abolished, he had been *alcayde*, or jailer, in some prison belonging to that dread tribunal. According to his own account, he had served in what was called the Army of the Faith, a body of implacable fanatics, who hesitated at no means, however astute or cruel, to endeavor to perpetuate a system which had been for ages the bane of domestic felicity, the curb to rising intelligence, and the fosterer of the most evil passions.

That baleful system having at length been resisted in the most determined manner by the mass of the Spanish people, the majority of its agents and abettors had either fallen in the various encounters between the constitutional forces and those of the Army of the Faith, or had emigrated to France, Italy, and other countries, whilst considerable numbers dispersed themselves in various parts of Spain, where they were generally regarded with suspicion and hatred, not unmingled with fear, in spite of their prostrate position; for they bore the indelible stamp of beings who had been in the habit of perpetrating crimes of the very deepest dye, either in the dungeons of the Inquisition, where none but the monsters in human form who tortured their victims in secret could hear their shrieks for mercy; or in districts which the Army of the Faith had under its domination, persecuting and castigating those whose words, actions, or even looks, could be so distorted or misinterpreted as to be made the groundwork of a suspicion.

This Venceslas Uriarte's habits were expensive; but the source whence he drew his pecuniary supplies was unknown; and although he practised all the outward forms of religion with scrupulous exactitude, and had, on that account, gained a certain reputation for piety in some quarters, he was generally looked upon as a dangerous person. Strange and ominous expressions, fearfully indicating that he was familiar with crime, escaped his lips in unguarded moments; and he gave way occasionally to the most furious bursts of passion in altercations with his associates, his vengeful glances causing the bystanders to tremble lest he should put an end to the dispute in some violent and tragical manner. Nor were their fears groundless, although the fatal blow might not be struck in their presence. The following instances are characteristic of the man:—

Some one having asked him how it was that, being so excellent a shot, he so seldom went out for a day's sport, his reply was—"To find a hare, it is necessary to undergo fatigue. Then, if you shoot it, you must run some little distance to pick it up; and you must afterwards walk a long way if you wish to sell it. 'Tis much better to wait for a man; he comes of his own accord; and when you have killed him, all you have to do is to ransack his *alforjas*." [saddle-bags.]

One day, however, he went to shoot wild-fowl in company with Antonio P. Dirba, the contrabandista, to Los Alfaques, which are a cluster of small islands or banks near the mouth of the Ebro, thickly overgrown with tall reeds, and which afford shelter to great numbers of wild ducks and flamingoes. At the close of their day's sport, they entered a fisherman's hut in search of refreshment; but all they could obtain was a salad, cut into very small pieces, and, as is the custom in Catalonia, swimming in a profusion of liquid called *caldo*, composed of water, oil, and vinegar.

Antonio, in helping his companion to some *caldo*, used rather clumsily the roughly-fashioned wooden spoon which the fisherman had produced; for though he seemed to be ladling out the *caldo*, he in reality transferred scarcely any to his companion's plate; and Venceslas insisted that he had turned the spoon the wrong way upwards, and that he was stupidly trying to take up the *caldo* with the convex side of the spoon. Antonio maintained that he was using the hollow part, and out of this trifling matter a most violent quarrel arose. And yet, as is the case with regard to many other serious quarrels, the origin thereof was not only insignificant, but groundless; for a person who accidentally came into the fisherman's hut, and to whom the matter was referred, declared, on the first glance at the object in dispute, that both sides of the spoon were alike; that is, nearly flat.

Three days after this absurd contention between Venceslas Uriarte and poor Antonio P. Dirba, the latter was found lying dead, with a rude wooden cross in his stiffened hands, near the Coll de Balaguer.

During Lent, in the year 1832, a troop of strolling players had been performing with great success at Tarragona one of those *Autos Sacramentales*, or sacred plays, which excite great interest among the Spanish people; inasmuch as they are living representations, displayed with great exactness, aided by scenic illusions, of some of the most remarkable and exciting events recorded in the sacred writings; the martyrdom of saints being frequently represented on the stage apparently in all their horrible reality. The auto sacramental which the company had enacted with so much éclat at Tarragona was, The Beheading of St. John the Baptist; and in the hope of meeting with equal good fortune at Tortosa, they departed early one morning from Tarragona by the high road which passes by the Coll de Balaguer.

The baggage, wardrobe, and other theatrical equipments of the company, were laden upon several mules; but the actor, one Fernando Garcia, who performed the part of St. John, preferred to carry one part of his costume himself.

Fernando Garcia was a short man, which was a main point for the effective representation of the principal character in the auto sacramental; for, in order to give an appearance of reality to the scene of the beheading of St. John the Baptist, a *bonetillo*, or leathern skull-cap, was placed on the head of the actor of low stature, and upon the said skull-cap there was fixed, by means of a spring, a false head imitating nature; and the actor's dress or raiment was so arranged as to reach above, and cover his own head, leaving visible only the false one, which being struck off by the executioner on the stage, and placed appa-

rently bleeding on a dish, or charger, produced a startling and exciting effect upon the spectators.

Now Fernando Garcia could not make up his mind to confide this precious *cabeza*, or head, which was so essential an instrument of his theatrical success, to the care of a muleteer; for it was not merely well modelled, light in point of materials—the features being painted so as to imitate nature to perfection, with real hair parted over the forehead, and hanging gracefully over the back part of the neck—but it had glass eyes, which were constantly in motion by means of an internal spring, which was acted upon by the pressure of the said imitation-head on the skull-cap surmounting the actor's real one.

So little Fernando thought that the safer way of conveying this all-important piece of mechanism was to make himself a head taller on his journey, by ingrafting it on his own pate, as he was wont to do on the stage; and accordingly, in this guise, and mounted on a hired horse, he wended his way towards Tortosa, with the rest of the company.

Towards evening, however, he found himself alone. He had loitered on the road, and, like all loiterers, he was exposed to inconvenience. The weather was chilly, and in order to ward off its uncomfortable effects, he covered his face, and even his eyes, with his *capa*; or cloak; and trusting to the intelligence and sure-footedness of his horse, he beguiled the time by thinking of the plaudits which would be showered down upon him at Tortosa, when he should personate to the life the saint whose counterfeit head overtopped his own, without feeling any ill effects from the cold against which he had so snugly sheltered himself from top to toe. Suddenly—just at the turn of the road at the Coll de Balaguer, that fatal spot where so many mysterious murders and robberies had been committed—a shot was fired from behind one of the enormous blocks of stone already described. The actor's horse reared, and threw his double-headed and muffled-up rider, who, whilst struggling to disencumber himself from the folds of his cloak, was terrified beyond measure at seeing a man with a carbine in his hand in the act of pouncing upon him.

Fernando, however, was not wanting in courage, and, having luckily just on that moment got free from the *capa*, he leaped upon his legs, and drawing forth a poniard, prepared for resistance.

Venceslas Uriarte—for he it was who was rushing upon his supposed victim—astounded at having for the first time missed his aim, was about to take to flight; but he lost all command over himself, and became riveted to the spot upon beholding a being with two heads; the upper one—that of St. John the Baptist—rolling its eyes in the most horrible manner, whilst the menacing orbs of little Fernando Garcia were flashing on him from their sockets in his own living head underneath, and the glistening poniard was elevated, ready to be plunged into his breast.

The robber's guilty conscience raised up the most fearful imaginings; his countenance became livid, his mouth gaped widely, his parched tongue clove to the palate, and he gazed wildly on the horrible apparition. In a minute or two, however, he made another desperate effort to escape; but, although accustomed to all the rugged paths, and agile in surmounting every obstacle when pursuing his prey, or in rapid flight with his booty, such was his trepidation, that his *alpargatas*, or

hempen sandals, got entangled among the briers, and threw him down several times. He tried to climb at once up to the higher part of the Coll, and for that purpose caught at a shrub which was growing out of a crevice; but the force of his desperate grasp, and the weight of his convulsed body, drew it out by the root, and he fell again at the feet of the double-headed comedian, who had hotly pursued him.

"Avaunt, Satan! Touch me not, demonio!" cried the assassin, making the sign of the cross. But his exorcisms had no effect upon the bold Fernando Garcia, or upon St. John the Baptist's head; for the former stood over him with the drawn dagger, crying out stoutly at the same time for his comrades by the odd names which actors are apt to adopt, and which no doubt sounded to the prostrate robber like calls for a host of demons to carry him to the realms of eternal torment; and the latter kept rolling its eyes frightfully.

The rest of the company hastened to the relief of Fernando on hearing his cries, and found the murderer helpless from the effect of fright and a smiting conscience. He was bound and taken to the nearest town, where he was searched in presence of the proper authorities. He wore a coarse haircloth shirt; and there were found upon him a rosary, a little book of prayers, and a sort of lock-et, containing—according to a memorandum on the piece of parchment in which it was wrapped—some of the hair of St. Dominic. But he carried also concealed a poniard of highly-tempered steel; and in a pouch were four bullets, each wrapped in a small piece of greased linen, and fitting his carbine. There were also a few charges of fine gunpowder in a flat powder-horn.

This hypocritical and cruel malefactor was reduced to a state of abject cowardice by what he considered to have been a supernatural interposition, and confessed that he was the assassin of El Coll de Balaguer.

"But," said the magistrate, "how could you dare to place the cross in the hands of your victims?"

"It is no great matter," replied the reckless murderer, "to kill the body; but to destroy the soul is an abominable crime! I adorned their tombs with flowers, and I prayed fervently that they might be spared some days of purgatory. I placed in their hands, immediately after their death, crosses upon which I had previously procured a blessing, in order that, if they were not in a state of grace, they might at all events repulse the devil! But *there* he is! I see him! I see him now!" he cried, on perceiving little Fernando Garcia advancing with his two heads, in order to show the magistrate how it was that his life had been saved.

"There he is! Avaunt, Satanos! avaunt!" muttered the wretched assassin, and he fell into a swoon, after some violent contortions.

He was tried by the proper tribunal, sentenced to death, and executed; and the brave little comedian had reason to rejoice for the remainder of his days at the practical proof which had been exhibited in his own person of the truth of the old saying, that two heads are better than one.

It is almost needless to add, that the auto sacramental was witnessed at Tortosa, and other places, with increased interest by the thousands who flocked to the theatre when it was represented, in consequence of the important part the head had

performed in the drama at the Coll de Balaguer, and in bringing to justice the notorious Venceslao Uriarte.

SECONDARY PUNISHMENTS.

THE witnesses examined by Sir William Molesworth's Committee established beyond dispute that our system of transportation made devils instead of reforming bad men. The range of transportation was therefore restricted. But our lawgivers do not appear to have seen the necessity of substituting some other secondary punishment for that of which they limited the application. Government is obviously at a loss what to do with its convicts. They have tried to wheedle more than one colony into receiving the lads who have finished their education in the penitentiaries of this country; but in vain. They have overstocked the only remaining penal colony, (Van Diemen's Land and its dependencies,) and shrunk alike from the expense of bringing home those convicts whose term of punishment has expired, and from again letting them loose upon English society. They have no faith in the *curative* tendency of their secondary punishments. They are convinced that liberated convicts only go to recruit the ranks of out-door professional criminals. Too indolent or too incapable to devise reclaiming processes, they have no resource except to remove the dangerous classes as far away as possible. All our colonies but one refuse to receive them; all refuse to become or continue the moral jakes and dunghill of England.

In this dilemma, Lord Stanley has proffered assistance: he will be the *Oedipus* to solve this practical riddle—failing to guess which, not only himself but all his countrymen may be devoured by thieves. Penal colonies in which convicts are subject to coercion having proved a failure. Lord Stanley proposes to try the experiment of a colony in which the convicts shall go at large and be indeed the only denizens. Its site is to be the Northwest coast of Australia: thither are to be removed all the surplus felony of Van Diemen's Land, who having conducted themselves with tolerable propriety will accept of a pardon on the condition of removing to the new settlement; thither are to be removed English delinquents, who to escape a worse fate will voluntarily banish themselves to this Stanley Utopia; and lest the generation of thieves should become extinct, the parishes to which these modern antitypes of the founders of Rome have belonged, are to be invited and encouraged to send out their families to them.

This is not punishment. It is treating our "dangerous classes" as the Romans of the latter empire treated the invading barbarians—buying off their aggressions. It is a confession that government can neither reform nor deter the vicious from crime. It is a mere scavenging process, carrying away our moral filth and depositing it where it cannot offend our noses, regardless of the wide contagion and pestilence it may spread elsewhere. It is to lay the foundations of a piratical state—the "Buccaneers' Archipelago," on the coast where the settlement is to be formed, may have suggested the idea. It is to reestablish, under a worse form and in a wider extent, that transportation system which has been restrained by law as tending inevitably to cause more crime than it cured.—*Spectator*.

From the Polytechnic Review.

THE GAME OF CHESS BY THE ELECTRIC TELEGRAPH.

WHAT the changes are that are to take place in our social condition by the three great agents lately brought by science into action—steam, electricity, and the atmosphere—no human intellect can foresee. The more immediate effects are just visible. Of the speed with which we can travel we can form at present no exact estimate; but we can prove that we can communicate our ideas by electricity from one spot on the earth round the whole globe in one tenth of a second. The game of chess lately played at the two termini of the South-Western Railway is a popular illustration of what can be effected at present, though it by no means exhibits the marvellous powers which the electric telegraph may yet be brought to show. The only striking feature of this experiment was the regularity and precision with which information of the moves was uninterruptedly conveyed for a number of successive hours. The descriptions with which we have from time to time furnished our readers of the different electro-magnetic telegraphs, and more especially of that of Mr. Wheatstone, have enabled them to understand the mechanism which was brought into action. Owing to the anxiety to promote in the most liberal manner the objects of science which the directors of the South-Western Railway have always shown, we were enabled to be present at the distant station, Gosport, during the performance of the game, and enjoyed ample opportunity of witnessing the simplicity of the mechanical means which Mr. Wheatstone has adopted, the advantageous use he has made of the velocity of the electric current, and the distinct and lucid means he has employed of displaying the necessary signals. Of the game played by those distinguished professors of Chess, Mr. Staunton and Mr. Walker, we have little to say; the battle may be considered to have been rather one of rapid execution than slow calculation, as the object was more to test the powers of the telegraph than the skill of the players. It was, as might therefore be expected, a drawn game. The amateur of this beautiful science, however, might have derived a more than usual share of information, for, during the period when the player was in expectation of a reply from London, Mr. Staunton went over the probable moves which were about to be made by his adversary, and threw out various suggestions which were in themselves admirable lessons. This fortunately relieved the tedium which would otherwise have arisen from the circumstance of being obliged to wait sometimes more than ten minutes before the determination of the London player was made known. This, together with the well known conversational powers and lively observations of Mr. Staunton, distinguished as he is for gentlemanly manners and first-rate ability, enabled us to remain from eleven o'clock until nearly six in the play-room, during which various messages, questions, and answers were unremittingly passed backwards and forwards, without in the slightest degree affecting the telegraphic communication which kept up the game of chess.

We may anticipate some most singular effects will be produced by the electric current. There is no reason why any great event might not be communicated at the same instant throughout the whole kingdom. The salutes fired on the occasion of her majesty's visit to the house of lords might

be instantaneously repeated, at every station, on all the railways in England; for the electric flame fires gunpowder, and the explosion of the powder is at the same instant with the crack of the discharge. The expense of Captain Warner's long range is at once spared to the country; instead of blowing up a ship at the moderate distance of six miles by one of his projectiles, we shall be enabled to do so at the distance of a thousand miles. There is, indeed, no reason why one of the lords of the admiralty should not himself fire the guns of the batteries at Portsmouth, whilst calmly and quietly seated at the board in Whitehall. Nor is there any reason why the electric current may not be made to answer in the more peaceful or even the more elegant accomplishments of life. A galvanic arrangement might be made by which our accomplished pianiste, Madame Dulcken, might, with all that taste and skill which delights her London auditory, perform at the same moment for the gratification and enjoyment of Gosport and Southampton, and wherever a few wires could be conveniently transmitted. We might also observe that the Society for the Prevention of Cruelty to Animals ought to call upon every butcher to kill the animals used for food by electric galvanism. Each of these persons should have a small galvanic battery for this purpose. Not only is all pain spared to the poor lamb, "whom thy riot dooms to bleed to-day," but the meat is rendered more tender, and more delicate. It is more than half a century since Franklin commenced those experiments which the remorseless hand of war put a stop to, which have been the precursors of the wonders of the present day. He proposed to give a feast to electricians, when "a turkey is to be killed for our dinner by the electric shock, roasted by the electric jack, before a fire kindled by the electrified bottle; when the healths of all the famous electricians of England, Holland, France, and Germany, are to be drunk in electrified bumpers, under the discharge of guns from the electric battery." Were we to indulge in our prognostics of what will yet be done by the powers of electro-galvanism, we should be considered as visionary enthusiasts, and the laugh of the uninitiated would doubtless be loud and long; but already are some of the wonders made known, and nothing but the expense attendant upon them prevents them from being generally brought forward. By its means ships may yet be navigated on the ocean, our cities illuminated, the weather changed, life protracted, some diseases avoided; and we may use the language of him who first by electricity drew lightning from the clouds: "I shall never have done, if I tell you all my conjectures, thoughts, and imaginations, on the nature and operations of this electric fluid."

Letters from New York, second series, by L. MARIA CHILD. The Boston publisher is J. H. Francis. 128 Washington Street.

A most delightfully written book, on a great variety of interesting subjects. There are passages, richly scattered through it, of wonderfully graceful and highly-wrought skill, beauty, music and pathos of style. Mrs. Child has written much and well. She feels the deepest interest in all that is excellent, benevolent and hopeful in humanity and society, and her power and success, as a writer, are continually increasing.—*Christian Register*.

From the Spectator.

CAPTAIN GROVER'S "BOKHARA VICTIMS."

CAPTAIN GROVER is a friend of the late Colonel Stoddart, and of Dr. Wolff, whose return from his dangerous Bokhara expedition has just been matter of public gratulation. The gallant captain is also Chairman of the Committee of the Stoddart and Conolly Fund, which body he was a main instrument in organizing; he has been engaged in extensive correspondence upon the subject of the "Bokhara Victims," especially with the foreign office; he has travelled to St. Petersburg with a view to interest the Russian government in their liberation; and in addition to all the trouble and expense incident to his self-imposed duties, he has been victimized by the foreign office to the tune of four hundred pounds and a pair of gloves. This result was brought about in the following manner.

Our agent at Teheran, having an inkling that Dr. Wolff might draw upon him from Bokhara, wrote anxiously to know what he was to do about honoring the bills. The foreign office replied, that he might incur "any reasonable expenditure" to get the Doctor out of Bokhara; after which, it seems, the excellent enthusiast might have been left to shift for himself in the heart of Persia, but that Captain Grover came forward with a guarantee for a sum not exceeding 500*l.*, by which means Dr. Wolff was enabled to obtain a supply. In course of time, a bill for 400*l.*, endorsed by Mr. Banel of the Foreign Office, was presented to Captain Grover, accepted at sight, and honored the next day, though drawn at a month. The captain then wrote to Lord Aberdeen, requesting the return of his guarantee, and somewhat plumping himself upon his four hundred pounds. The office, in a rather paltry mode of evasion, denied that the bill came "officially;" and a correspondence ensued, *strong* on the part of the captain, or, in diplomatic style, "seeming, by the tone and language, to cast a slur upon the conduct of her Majesty's government; which," continues the under secretary, "has, in fact, been throughout humane and consistent." The captain, however, stuck to his text; and Lord Aberdeen, seeming to get ashamed of the transaction, sent for Captain Grover, tried to talk him over, and offered to pay him his four hundred pounds if he would withdraw his two last letters.

"His lordship again warmly urged me to withdraw the letters. I positively and firmly declined; telling his lordship, that if he were as happy at saving the 400*l.* as I was in paying them, and being the humble instrument of restoring Dr. Wolff to his country, then indeed we were two happy men. I felt too indignant at the insult that had been offered to me to hear his lordship's reply, and hastened as quickly as possible from his lordship's presence."

In his haste and anger forgetting his gloves, which remain as a sort of *spolia opima* for the foreign office.

This was not the only occasion on which the veteran was too hard for "this office." A Lieutenant Wyburd is among the missing in Central Asia: Captain Grover had learned that he had been appointed on a secret mission to Khiva by Sir John Campbell, in a despatch sent to the East India Company, but of which the foreign office had notice and a copy. Upon this private knowledge of the country, the old soldier laid an ambush, into which the unwary diplomatists fell.

Saying nothing of his proof, the chairman of the Stoddart and Conolly committee wrote to call Lord Aberdeen's attention to the case of Wyburd in connexion with that of Dr. Wolff. The office grandly, yet blandly, replied—"With respect to the statements in your letter that Lieutenant Wyburd was sent on a secret mission to Khiva in the year 1835, I am to inform you that **THIS OFFICE IS NOT AWARE** that Lieutenant Wyburd was sent on any mission at all to Khiva." Captain Grover, in reply, gave particulars and dates; when "this office" had to explain its "error,"—somewhat after the fashion of Wotton's celebrated definition of an ambassador, substituting at home for "abroad," and this office for "country."

These things go to the morality of the office. The following strange fact will, we dare say, be felt by officials to be more discreditable than any little official laxity.

DOWNING STREET GEOGRAPHY.

In the case of my unfortunate friend, [Stoddart,] no sooner did Saleh Mahommed's lying statement (the man is now a convicted scoundrel) reach Downing street, when these gentlemen, without even taking the trouble to send to the Royal Geographical Society to inquire in what part of the world Bokhara was situated, officially announced that Colonel Stoddart had died at "Bokhara in Persia!" I can assure the reader that I am not joking now; the above melancholy fact will be found in the "Monthly Army list" for March, 1843. Fearing that this display of ignorance might be perpetuated in the "Annual Army List," I wrote to the secretary-of-war, in which I expressed to him my desire to avert such a misfortune, and respectfully informed him that Bokhara was an independent nation, more than twice as big as England and Wales, and that it had no more to do with Persia than with Russia or China.

I received in reply a letter of thanks, and an intimation that the word "Persia" would be left out in the "Annual Army List." And so it was!

The blunder will appear more ridiculous if the reader reflect for a moment; it is like saying he died at England in France—not the mere misplacing of a city, but letting one country drop down upon another.

Before we leave the offices, we add an instance of official prophecy against fact; remarking that our author still doubts, notwithstanding Dr. Wolff's statement, whether Stoddart and Conolly have really been executed.

DEAD AS A STOCK-FISH.

I extract the following from a printed report of what took place at a meeting of the Royal Geographical Society, on the 11th October, 1844.

"Mr. Murchison, the President, in the Chair."

"At the close of the discussion on Dr. Beke's paper, the president, seeing Captain Grover among them, called the attention of the meeting to the great probability of the existence of Colonel Stoddart, a valued member of their society: he (the president) recollected when Captain Ross had been above three years blocked up in the ice, going to the admiralty with some scientific men, to urge the authorities to take measures to ascertain the fate of that officer and his gallant band: the reply he received was this—'It is well for you scientific gentlemen to form an opinion on a subject with which you are totally unacquainted; we can

tell you that Captain Ross is as dead as a stock-fish."

It may be inferred from our account of *The Bokhara Victims* that it in some measure partakes of the character of grievance-mongery. It is, however, an amusing book, from the active, straightforward, uncompromising character of the author, which displays itself in every sentence, rendering weariness impossible. It is curious, and something more, for the insight it gives into official doublings and trickery; yet we must say for the foreign office, that it has a better and more gentlemanly tone about it than the colonial. It stands forth externally plausible, though rather scurvy inwards. Its communications to Captain Grover are patient, considerate, and full; and we think that Lord Aberdeen was only moved by a sense of kindness towards Captain Grover at last, and at first by a mistaken feeling towards red-tape forms, touching the four hundred pounds and Dr. Wolff. The letters of the officials as well as their whole conduct are very clever; and any one save an old campaigner, not to be *done* by words, would have gone away, doubtful perhaps, yet certainly tickled by diplomatic suavity.

The subject of the book also is important, and there is a chance that its importance may be lost sight of in its oddities. Captain Grover affirms, more especially as regards Stoddart, that the victims were British envoys, sent by public authority on public business, and then abandoned to their fate, without even an attempt at rescue. On the contrary, the government seem to have totally cast them off, lest, if they admitted their character, they might be "embarrassed" in having to claim them. Upon this point the *proof* in the volume does not seem to be clear. The case of Stoddart rests upon the statement of Captain Grover; and Conolly, though an envoy as far as Khiva, appears to have gone on to Bokhara *sua sponte*. Government, in a despatch by Lord Ellenborough, called them "travellers;" and we suppose they are ready to maintain that view. Our own opinion is decided, that all these unfortunate gentlemen were in the employ of government; but we are not so clear that they were employed under circumstances that gave them a right to protection as envoys—that is, to a war on their account. The employment of secret agents who go on a mission understanding that they take their chance of disavowal, like the employment of spies or the encouragement of conspirators in war, may be a wrong thing abstractedly; but if it be had recourse to, the persons engaged must follow the laws of the business they engage in, and risk the consequences; for in Napier's words, men cannot be *ordered* on such services—they can only be *tempted*. We do not say that such was the case—we only think it was; but we do not see how the doubt is to be cleared up. Even were a parliamentary inquiry granted, we suspect the fact might not easily be established; for this kind of engagement implies secrecy, and the proofs of an adverse view, should such exist, would not be produced by the foreign office; though, if Captain Grover's information is correct, enough might be forthcoming to convict Lord Palmerston of neglect, and Colonel Stoddart of indiscretion and of obstinacy in not departing with the Russian embassy.

From the Spectator.

THE MORALE OF PEEL.

SIR ROBERT PEEL has propounded what is really a minor measure, a matter of detail in carrying out the Irish policy which he evidently contemplated from the first on reëntering office in 1841, though that policy was for a time disguised by the inaptitude of his Lord-Lieutenant until Lord Heytesbury was sent over. But from discussing this measure, politicians, in and out of Parliament, have flown to discussing the statesman, Peel himself, with all the eagerness, the nice curiosity and cruel anatomizing, of naturalists over a newly discovered creature. The question before Parliament is Maynooth, but the subject of investigation is Peel; and a sudden furor has bitten divers persons to hunt him down. The measure is one desiderated by many; but even of those, some are seized with a new scruple, and like the hungry squire that took the bread of Lazarillo de Tormes, they fastidiously ask if the hands are clean that give it. Peel, they say, has no right to offer this measure, because he never offered it before, and because it is inconsistent with various things that he has said in past years. In proof, Mr. Disraeli has raked up *Hansard*; and Mr. Macaulay has made a searching historical retrospect, and shown how the statesman has avowed opinions in opposition which preclude him from endowing Maynooth without forfeiting "consistency." His defenders scarcely mend his case, though they have severally a double or alternative line of defence. They say, which is true, that he has always shown himself liberally disposed to the Catholics, even before 1829. Sir Robert is much too decorous a gentleman to have been a harsh or illiberal minister, whatever may have been his theoretical opinions for the time. But then his defenders say that he has always upheld, at any sacrifice, the Established Church; as when he went out of office in 1835. These two lines of defence answer each other, mutually destructive, like two negatives: resistance of Catholic Emancipation in 1828 is answered by acceptance of Catholic Emancipation in 1829; flight from the appropriation-clause in 1835, by the embracing of Maynooth in 1845. As to this measure, it is asked whether, if he had now been in opposition, Sir Robert would not have opposed the very bill he proposes! The affirmative rises to every man's lips. What right, then, has he to propound it in office? That is the question which is thrown in his teeth, and on which his stay in office hinges threateningly.

Sir Robert Peel is not a man of principles. He is a man of honesty in motive and deed; a man of conduct. But when any great question lies before him for judgment, he does not "bottom" it—he does not trace it to its elements and deduce the first principles. In politics he is a manufacturing, not an experimental chemist. This condition of his mind may be learned from any of his great speeches. His views and measures never have taken their rise in principles: they have been suggested to him by circumstances; and if he has used principles at all, it has been at second hand, from the received authorities, by way of illustration or apology to weigh with other people. Had he been a man of principles, he would have foreseen in 1829 the Maynooth bill of 1845, and would have enunciated the latent fact. But he looked no further than 1829. He does not view any course

of action from the *a priori* station, and therefore does not see the ulterior consequences in perspective. He looks across the vista, "taking things as he finds them," and seeing only what must be done at the time. In discussion on the measure of the moment, he uses, with excellent practical effect, the current arguments, the reasons that are uppermost in his mind. But he does this in a journeyman style, not with scientific generalizations; so that if you analyze Peel's speeches at any one time, it is easy enough to find passages which are on the surface inconsistent with what he says at other times. And for lack of the "bottoming" and generalizing faculty, he cannot explain away the dissonance. If it is to be done at all, somebody else must do it for him. He knows the flaw well enough, and has said so more than once; but he simply acknowledges, and cannot remedy it. That is not in his department. Thus, in all probability, had he been in opposition, he *would* have resisted this Maynooth bill; because in opposition he is reduced to mere reasoning upon a matter: he would have come to it with an adverse bias; and as he does not generalize, the objections evident to his ingenious and workmanlike scrutiny would not have been counteracted by looking at it in "the long run." As his mind does not spontaneously take a perennial view of passing affairs, but merely jots down a tally of work done by the job, and is satisfied if it is well done, so he does not very strongly feel the reproach of some "inconsistency" between remote acts. The careless way in which he has alluded to such lapses proves his want of acute perception on that score. But it is less a fault in moral feeling than a defect in a particular faculty of intellect.

With all his faults and inconsistencies, Peel has achieved so much, that when deeds are in question he is the man to whom all parties look up. The conservatives chose him for their leader; and though they now talk of dismissing him, there is not one among them that would venture to answer the question, "Whom will you have instead?" The whigs, in the person of Lord John Russell, have addressed him as the man to do the work of free trade and Irish conciliation, if he only avow the will. Nay, he is doing what the whig writer, Sydney Smith, on his death-bed, exhorted him to do—he has "summoned up all his political courage;" he has "run some risk of shocking public opinion;" and if he has not proposed payment of the Roman Catholic priests, he has done something like it, and his friends say that that is coming. Radical Mr. Ward cheerfully moves his own dilettante theoretical legislation out of the way of Peel's solid practical handicraft. And see how Mr. O'Connell compares Peel's completeness of work with whig botching. Why is it that a man at whom all are ready to carp is "sent for" at every emergency? Because he is a cool, able workman—not a crotchety ratiocinator, but a man of action—not a man of principles, but a man of results. He never aims at some "far-seeing" impracticable end; he does not measure you for a suit of clothes with a quadrant. His attention is not distracted from the job that is set before him; he thinks of nothing else till that be done; and he talks for the time, like all journeymen, just as if there were nothing else to be done in the world. On account of this strict and limited range of working, he is seldom suspected of meaning more than is professed at the moment. What he does may involve more: something else may ensue, as to-

morrow will come after to-day; but there is no more intent in the case than there is a conscious purpose in the passing to-day. Therefore he is trusted to do work which would not be put into other hands. When Catholic emancipation became inevitable, Peel was allowed to do it, because they knew that he would not get intoxicated over his job and go on to some Maynooth measure. Now we have come to Maynooth, and if anybody do that work it will be Peel; because endowment of the Catholic priesthood will not be smuggled through along with endowment of the college. Peel is a steady man; somewhat reserved, and apt to go faster than his gravity implies; but still he takes one step at a time; and the conservatives, once called obstructives, know it.

It is to be noted that all Peel's evil deeds have been done in opposition, his good works in office. He went into opposition to resist emancipation and appropriation; in opposition he resisted the reform bill, tripped up the whig budget, talked big about "rebellious" Canada, abetted Lord Stanley's Irish registration bill: in office he has achieved emancipation, accomplished two new free-trade-ward tariffs, sanctioned "responsible government" in Canada, quashed the registration bill and made some changes in an opposite sense, appointed Lord Heytesbury *vice* Earl De Grey, passed the charitable bequests act and the dissenters' chapels acts, and now proposes to endow Maynooth College. He talked foolishly in opposition, and entered office practically to refute himself. His has been a process of gradual development. Under favorable circumstances, that is in action, he has exhibited a steady progress from one class of opinions, among which he emerged into public life, towards another; so that the tory subordinate has practically become the most efficient liberal leader. It has been less a series of tergiversations than a steady process of conversion; lacking, however, the faculty of generalizing exposition to give coherence and symmetry to the aspect of the entire process. Lord Worsley makes a merit of saying that "he will not reject the measure because ministers have not heretofore acted up to their present professions;" a strange kind of toleration for improving scholarship! It is as if a teacher were to say to the top boy in the class, "I will not, because last year your composition was not so good as it is now, send back your thesis."

Peel is, in fact, the embodied reflex of the public mind of England. He is feeble to originate great strokes of statesmanship, or to recognize on mere reason shown; he is strong to see what must be done, and to consummate. If he has made a mistake now, and has supposed that a thing must and can be done which must not and cannot, it is because he was deceived, naturally enough, by the opinion among active and demonstrative politicians in parliament, in "society," and the press. By whom is he opposed? By all extremes—ultra tory and ultra-radical, high church and dissenters; each section assailing him because he is *not* a bigot to either view. The conservatives, after four years of power, forget how they could never do without him. If he fail, it will be because the conflict of opinion is so complicated and balanced that it cannot decide itself. If it could do so, he would act effectually; for he is, not the leader of public opinion, but the minister of popular decisions.

Meanwhile, the contest itself, whatever its issue, is not one of the least signal events in which

Robert Peel has been instrumental. It has shaken the new conservative party to its foundations, and a yawning schism is seen to divide it. It has not left the whig party untouched by the convulsion. Parties are once more "resolved to their elements," to fall into new combinations: perhaps partly into the old affinities. But in the process, old prejudices have been shaken, the dross of old Toryism has been precipitated, the mixture for daily use has been cleared. Old dogmas have been jostled from their embedded places, and washed away to lie at least among unsettled doubts; mooted questions have fallen into firm resting-places; and henceforth opinion sets forward from new starting-points. It is not the first nor the second time that as much has been done for public opinion, perhaps unconsciously, by a man who deals little in mere opinion. It is, too, a gratifying feature in these changes, that they are not simply triumphs of one party over another, but wholesale moves forward of entire parties, with a general concurrence. The very converts vaunt the conversion. Mr. Charles Wynn is right in saying that "tory" and "whig" are names for things which have gone; and to no one man is that great push forward so much due as to Robert Peel.

From the Polytechnic Review.

GLASS-MAKING IN ANCIENT EGYPT.

A STRIKING fact is proved by the extant relics of the glass manufactures of ancient Thebes in the British Museum, as well as other museums, and by the illustrations of Rosellini (copied from the Tombs of Thebes) of the laboratories of the glass-blowers, and the workshops of the glass-manufacturers of Thebes, during the early eras of the eighteenth dynasty (1700 or 1600 B. C.)

It exposes the error of the ordinary ideas indulged by historians and antiquarians on the subject. It is common to assert that, with the exception of some glass vessels at a great price, glass was little known, and little used, till the time of Augustus, and was never employed in windows till after the fall of the Roman empire. The circumstances of pieces of glass of good manufacture having been found at Pompeii ought to have thrown light upon this allegation, derived from an ambiguous assertion of Pliny. The fact is, that glass and porcelain, of an equally good quality as that in common use in modern times, was made sixteen or seventeen hundred years A. C. in Upper Egypt. It appears, also, to have been made in profusion. This is a second allegation, supported by adequate proof. But a third, of a more startling character, has been added. It is affirmed that the glass-blowers of Thebes were greater proficient in their art than we are. They possessed the art of staining glass, which, although not wholly lost, is comparatively but little known, and practised only by a few. Among the illustrations of Rosellini is a copy of a piece of stained glass which was found at Thebes. It comprises various colors, which he describes as struck through the whole vitrified structure, and refers to other instances of ancient Egyptian stained glass which he has seen, in which the colored design is equally struck through squares of glass an inch thick, thoroughly incorporated with the vitreous structure, and appearing the same on the obverse as on the reverse side. It was in consequence of being aware of this fact, that Winckelman asserted that

the Egyptians of the eighteenth dynasty brought the manufacture of glass to a much higher point of perfection than ourselves. In fact, after the decline of the art, Egypt became to Rome what Venice became afterwards to Europe. The greater part of the supply of glass in his time, was considered by Pliny to derive its good quality from the ashes of a peculiar genus of kelp, growing in abundance by the Lake Mareotis and the Red Sea. That kelp, reduced to a kind of green ash, is represented by Rosellini as brought by the workmen in baskets to the glass manufactories, and also to the potteries, where a vitreous process was evidently employed for the purpose of glazing the earthen vessels. It would appear, both from proofs that remain and cotemporary records—provided full reliance can be placed on the latter—that Winckelman's somewhat startling allegation comes very near the truth. The Egyptian glass-blowers and glass-cutters of Thebes imitated amethysts, rubies, and other precious stones, with wonderful dexterity, and, besides a great proficiency in the art of staining glass, to which reference has been made, must have been aware of the use of the diamond in cutting it and engraving it. In Mr. Salt's collection in the British Museum, assignable to the era of Thothmes the Third, there is a piece of glass beautifully stained throughout, (like that described by Rosellini,) and skilfully engraved with his heraldic emblazonment, precisely on the principles of modern heraldry; or, as the double oval shields containing the names and titles of kings have (for some reason unexplainable by Champollion) been called "*cartouches*." The profusion of glass in ancient Egypt is attested by several trustworthy authorities. The historical relation that the embalmed bodies of Cyrus and Alexander were deposited in glass coffins in Egypt has been, indeed, considered as a fable; but it may be said to be analogically proved by recent discoveries of portions of granite sarcophagi which are covered with a coating of stained glass, through which the hieroglyphics on the stone appear. Diodorus Siculus says, that entire coffins were commonly made of glass in Upper Egypt. This would demonstrate an extraordinary profusion; but certainly an equal of the dearest glass manufactures may be practically proved. Vast numbers of imitative precious stones,* in glass, made by the jewellers of ancient Egypt, are to be found in all the museums of Europe. Among them are false emeralds of considerable size, in which the artisans of hundred-gated Thebes appear to have principally excelled. There is little doubt that many of the large emerald basins used in the early Christian churches were of their manufacture. The extensive character of the manufacture may further be inferred from a circumstance recorded by Pliny, that in the Temple of Jupiter Ammon there was an obelisk of emerald, that is to say, of glass in imitation of emerald, sixty feet high. The emerald hue which the glass-manufacturers of Egypt gave to glass, appears, from chemical analysis, to be imparted by oxide of copper, and the reds used on ordinary occasions in staining plate-glass appear to have been given by minium. All these facts prove the extensive knowledge of chemistry among the natives of old Thebes.

* Real precious stones, natives of India, and brought doubtless by the alleged railroad from Cosseir in the Red^d Sea, (amethysts, hematites, and lapis lazuli, and a species of topaz.) are found in the tombs of the era of Thothmes the Third.

Glass bottles, (quart bottles?) nearly similar to our wine-bottles in color and measure, though in shape resembling the wide-mouthed bottles used in preserving fruit, may be seen in the British Museum, and are found in abundance in other European cabinets.

A remarkable fact connected with the manufacture of ancient Thebes 4,000 years ago, shows the traditional tenacity of ancient custom. It is well known that the oil-jars of the Levant are precisely similar to those which appear in the illustrations of Rosellini. So the Egyptian earthen amphora, without feet, adopted afterwards for strong wines by the *bon vivants* of Rome, retain their original shape and purpose among the Tuscan farmers. With reference to glass bottles, there are two classes used at the present day of equally ancient origin: these are the Florentine oil-flasks, holding about three quarters of a pint, and the turpentine carboys, as they are called, holding four or five gallons, from Cyprus and the adjoining shores of the Levant. Both are protected by matting, the first of a fine, the second of a coarser nature. Both are seen, with slight alterations, in the illustrations of Rosellini. Sir G. Wilkinson thinks that glass lanterns were used by pickets of soldiers, and gives a specimen of a group of Egyptian sentinels carrying a lantern on a curved pole. It is not improbable that an hieroglyphic on the Rosetta stones, translated *manifestation*, resembling a magic lantern with a handle, from which rays of light are issuing, may be something of the kind. That the glass-manufacturers made magnifying lenses is clear from Plutarch, (*de facie luna*.) Diodorus, and Ptolemy, the astronomer, and is proved by the extant cameos, which could only be cut by the aid of a microscope. But reverting to the subject of lanterns, it is probable, though it cannot be gathered from Pliny, that the lamps employed for yearly illumination at the Saite festival—a custom transmitted from remote ages to modern China—may have been of glass. The Egyptians, in the time of the eighteenth dynasty, appear to have used colored lanterns, like the modern Chinese, on the latter as well as ordinary occasions. Indeed, the modern people of Cairo use colored lanterns of striped gauze strained over a wire frame, after the Chinese fashion. But they are cylindrical and less florid and various in their decoration. The singularity is, that in the illustrations of Rosellini precisely similar cylindrical lanterns of colored gauze are seen in the hands of the running footmen and attendants on the grandees of ancient Thebes, when in the act of lighting their masters home from their evening banquets or *fêtes champêtres*.

In conclusion, it may be remarked as a singular circumstance, and which applies as well to other manufactures, (such as the potteries, metal foundries, the tanners, the turners, the dyers, and the hand-loom weavers,) that the initial process of glass-making retains its primitive simplicity. Now, as 4,000 years ago, the blow-pipe, shod with iron and heated red-hot, is inserted into the melted glass. In the ancient manufactories, workmen are employed in bringing the "frit" in baskets, for the purpose of vitrification. There can scarcely be a doubt that this frit is a combination, as in Venetian glass-making derived from Egypt, of kali, from the ashes of *salsola communis*, or kelp, and a particular kind of sand. But this paper ought not to conclude without some more distinct reference to the chemical knowledge displayed in

the more elaborate processes of glass-making. There are many striking examples of this proficiency in the new Egyptian room at the British Museum. But we will take the single instance of the tablet of stained glass found at Thebes, and of which Rosellini gives the illustration to which reference has been made. The design, as has been stated, is tasteful. It consists of a quadruple star, with a rose in the centre, and with foliage on the angles. Blue, yellow, red, and green colors are introduced, and they are struck through the body of the glass. In order to produce this effect of glass-staining, oxides of cobalt, or of calcined copper and zinc, must have been used for blue, oxide of silver for yellow, and oxide of copper for green. The ruby color of the rose, that color of which till lately we had lost the art of imparting, must have been given (as well as the rich purple hue of some of the fictitious gems) by the oxide of gold.

This proficiency may appear extraordinary; but indeed, the richly-painted walls of the temples, palaces, and tombs, where the unmatched colors remain as fresh as when first laid on, show not only a perfect proficiency with the mineral pigments, but a perfect use of the metallic oxides in their composition.

It is as easy as invidious to ascribe these applications to unintelligent accident or experiment, rather than to high proficiency in chemistry. Evidences, drawn from all the other arts and trades, prove that the ancient Egyptians, in the earliest times, were skilful chemists; and why should we deprive the land of Cham, Chemosh, and Chemonis, from which the name and art of chemistry—as well as alchemy, its foster-parent—was derived, of the just tribute due to its original study, discoveries, and inventions?

Quid feret Illiæ
Mavortisque puer, si taciturnitas
Obstaret meritis, invida Romuli!

Note.—Winckelman, on the Arts of the Ancients, has some observations on the ancient manufacture of glass, which may be conveniently added. Phny attributes the discovery of glass to some Phœnician mariners, who, having kindled a fire on the beach for the purpose of cooking, placed their utensils on blocks of nitre. The fire melted the nitre and the sand, and produced a vitrified substance, which improvement converted into pure glass. The Tombs of Thebes demonstrate that 4,000 years ago the manufacture of glass was well known to the Egyptians. The frescoes exhibit glass-blowers forming bottles and vials of green glass. The specimens of Egyptian vials in the British Museum are by no means inelegant; they have long necks bulging towards the bottom, which, when filled with any liquid, would be much less easily subverted than the vials in common use amongst us. Pocket-bottles, cased in leather, such as are used in sporting, for containing spirits or liqueurs, are amongst the curious relics of the Theban glass manufacture. It is clear, from specimens that are left, that the ancient Egyptians knew how to make casts in vitrified materials, and to counterfeit in glass the amethyst and the emerald, with a degree of success unequalled in any country. Nor were they unpractised in the ingenious process by which the representation of a bird or flower may appear to be imprisoned within a piece of glass, so as to form part of its own substance. It appears that

they constructed the device from filaments of colored glass, in the first instance; it was then covered with transparent laminae of glass, and all were fused together with so much skill that no joinings in any part of the work can even now be detected by the most powerful magnifier. In these specimens the colored device appears as perfect on one side as the other. Figures of birds were thus composed; and if cut through at intervals, each portion so divided contained in itself a perfect copy of the bird. The celebrated Portland vase was long supposed to be a real sardonix; but it is now known to be formed of layers of purple-colored glass united by fusion. By similar superfusion, the glass pieces used in the mosaics on the vaults of the domes at Venice have been enabled to preserve unimpaired their original coloring and gilding. A small diamond of the glass mosaic was gilded in the usual way, and then thinly coated with the vitrified material while in a state of fusion. This was an Egyptian art. The gold color and device appear incorporated with and struck through the body of the glass, so as to appear the same on both sides. An Egyptian sarcophagus of granite may be occasionally seen cased over in the same manner, in order to preserve unimpaired the sculptures and legends engraved upon the stone. To the eye of an ordinary observer, several necklaces, scarabæi, brooches, and small ornamental figures in the cases of the new Egyptian Room would appear composed of precious stones. They are, in fact, at least the great majority of them, composed of glass throughout the whole substance, or of materials covered with a glass coating. The tasteful colored networks of glass bugles, with which the wrappers of mummies were decorated, were made of the same materials, and are remarkable as being identical with similar ornaments made into bracelets, headbands, and waistbands, by fair dilettantis at the present day. With reference to the larger examples of vitreous superfusion to which reference has been made, a sarcophagus of this description was found by Belzoni in the Tombs of the Kings. The historical assertion is well known, and has frequently provoked commentary, that the body of Alexander, cased in gold, was buried at Alexandria, in a coffin composed entirely of glass. If the record be true, it is probable that the body so inclosed in glass was, for protection sake, reinclosed within a granite or other more durable sarcophagus.

From the Polytechnic Review.

ON ATMOSPHERIC RAILWAYS.

We directed the attention of our readers, some short time since, to the probable establishment of atmospheric railways upon many of the great lines of this kingdom: we likewise announced our intention of devoting some space to the consideration of Mr. Pilbrow's invention: this task we have been spared, by the kind permission of Dr. Hewlett to transfer to our columns his admirable paper on the subject, which, when read before the Society of Arts, deservedly obtained the warmest approbation. It explains, in so simple, easy, and intelligible a form, all the leading points, that no language of ours could render it more available to those who feel anxious to know what are the views entertained by the original proprietors of the patent, and those who are about to embark their capital in carrying out a scheme which promises to be of

such public utility. The vast mass of persons who are now deeply interested in all that belongs to rapid locomotion may have an opportunity of judging for themselves how far the plan proposed is likely to be serviceable: for ourselves, we entertain but one opinion, which is, that it should be urged upon the consideration of all those whose business it is to carry out the gigantic schemes now in agitation.

"In no subject is an active, energetic, and commercial people more deeply interested than in the means for safe and expeditious intercommunication; and, as we have long maintained a high preëminence among the civilized nations of the earth for our zeal, enterprize, and commerce, we can only expect to secure these honorable distinctions by affording every possible encouragement to those inventions and discoveries which have a tendency to bring the arts and sciences to the highest degree of culture and practical utility. The truth of this statement has been admitted; and yet a strange but most decided opposition has been raised to almost every remarkable invention that has been introduced during the last fifty years. The proposed locomotive steam-carriage was most violently opposed by the devoted lovers of stage-coach travelling. The olden times and the olden ways were so much admired, that any innovations on the olden practices were dreaded with a terror—a little less than that felt at an approaching earthquake. That the whole host of interested parties should be opposed to a new and improved mode or travelling was no more than might be expected, because the doctrine of vested rights, as maintained and practically carried out in this country, had ever been a mighty barrier to all social and moral improvements. But that parties, who had no such rights to be jeopardized or damaged, should be opposed, must be a matter of surprise to every reflecting mind; for not a few, both in Bristol and Birmingham, were to be found, who, on hearing of the respective railways proposing to accomplish twenty miles an hour, said, with much complacency—'Let others venture their necks who please; but as for me I am quite contented to travel at the rate of ten miles an hour, including all stoppages, and think it is speed enough for any reasonable man.' And so it was, according to the means employed—means which involved no small amount of suffering and cruelty to animals; but now that locomotive power has become a general mode for the transmission of men and chattels, the very persons who were so timid, and so dreading consequences, are now among its warmest advocates and substantial patrons. Yet this must not be regarded as an ultimatum, but merely a step in the ever-advancing course of improvement. Seeing how former inventions have been treated, on their first introduction to public notice, by the populace at large, it is no more than experience has taught us to expect, that every bold invention, developing some new power, should meet with a similar treatment; and upon this principle, a host of prejudices are arrayed against atmospheric railways. The prejudices which have existed against former inventions, and subsequently given way to approbation and admiration of the highest order, induce the writer of this paper to think, that those prejudices arose from a want of information, and a consequent misapprehension of the whole invention. This is certainly the case in reference to many who are opposed to atmospheric railways; they

talk of accidents occurring by this mode of travelling which must, of necessity, be more fatal than accidents by the locomotive power. No mode of travelling can pledge an entire exemption from accidents. A small piece of orange peel on our ordinary pavements may occasion the death of the man who accidentally puts his foot upon it. But this is very different from a company of men looking pale with fear, dreading that a shower of pumpkins from the moon will dash them to pieces, when they have not as yet any credible testimony that there are pumpkin gardens in the moon. With the utmost respect for the fears of the timid, and the misconceptions of the uninformed, we venture to think, that a few plain matter-of-fact statements will have a tendency to dissipate their fears, and correct their misconceptions. Correct definition is the foundation of all sound information. The terms constantly employed on this topic are 'locomotive power' and 'atmospheric principle or power.' Locomotive power is the mechanical force identifying itself with the carriages moved. Atmospheric power is a mechanical force acting on the carriages through different media—a force renewable at intervals on the line—so that the atmospheric power is often classed with the stationary, as the impulse, or cause of motion, is only at intervals, as in some railways, such as Blackwall, the rope by which the carriages are moved is put in motion by a power that is entirely fixed and distinct from the carriages themselves. The history of atmospheric railways will satisfactorily show that the principle is not so new—and, consequently, the plans constructed on it by no means so *jejune* and immature—as some imagine. If seven cities have contended for the honor of being the birthplace of Homer, it is no wonder that many persons who have had thoughts and imaginings on the subject, should contend for the honor of being the inventor of the atmospheric mode of propulsion. There are some difficulties in tracing this Nile to its right source; the first authentic data, however, which we have immediately connected with the subject, is the publication of a pamphlet in 1810, by Mr. Medhurst, in London, in which he proposed the idea of employing the power of the atmosphere created in an extended tube laid between the rails and communicating the moving power thus obtained to propel carriages travelling along a road. Mr. Pinkus, however, asserts, that Mr. Medhurst only proposed the impracticable part of Papin's plan of forcing air under the compression of many atmospheres, as several others before him had done, adding, at a subsequent date, the idea of moving a piston through an under-ground tunnel, by forcing in air behind it, from distances of twenty miles apart, and, by means of such piston and tunnel, impelling passengers and goods. Medhurst's first plan was to convey letters and goods by means of rarefaction and compression of air in a channel six feet high and five feet wide, contained in a paved road or iron railway. Mr. Medhurst, it should be observed, took out no patent, performed no experiments, and distributed his pamphlets chiefly amongst his friends; so great controversy has always existed as to the legitimacy and extent of his claims. In 1824 he contested his claims to invention, in a paper war with Mr. Valance; and in 1840, Mr. Pinkus contested them. In 1817, Mr. Lewis proposed a plan, which was a modification of that of Medhurst's. In 1824, Mr. Valance took out a patent for this method of an un-

derground tunnel, also availing himself of rarefaction and atmospheric pressure. Mr. Valance made experiments with his system at Brighton, but does not appear to have been successful, so that his patent produced him no return, while Mr. Medhurst claimed priority of the invention. There is, however, strong reason for deciding that Mr. Valance first proposed employing the power of the atmosphere against a *vacuum* for railway purposes, as Mr. Medhurst did a *plenum*.

"In 1828 Mr. Medhurst republished his pamphlet of 1810, and he then proposed to use a tube comparatively much smaller, to enclose a piston in it, and to transmit its action to the outside through a longitudinal opening; he proposed also to have stationary engines twenty miles apart, for forcing in air. Of this plan he published a drawing, showing a long box, and a pipe suspended over a channel of water, in order to make a water joint or valve. According to the assertions of some of his friends, he made experiments with this and failed, from the impossibility, explicitly says one, of making the continuous communication from the inside of the pipe to the carriage tight enough to allow a useful degree of rarefaction to be produced; Mr. Pinkus, however, says that he was well informed that Mr. Medhurst never made a single experiment. The suggestion of that mode of railway transit appears to be fairly due to Mr. Medhurst; the important step of creating a vacuum before the piston belongs to Mr. Valance, while the further improvement of attaching the piston to an external carriage is disputed by Mr. Medhurst and Mr. Pinkus; Mr. Medhurst's pamphlet is certainly the *first* publication, while Mr. Pinkus quotes no evidence as to his own claims. On the 1st of March, 1834, Mr. Pinkus brought out his first patent; and in this he proposed as a valve, one in the form of a cord or rope, and which he calls a valvular cord. Mr. Pinkus states that in 1830 he had again prepared fresh plans and specifications, such as are now enrolled, and that he had exhibited them to his friends, and in 1833 commenced his patent. In 1834 he constructed a large working model, which was publicly exhibited in Wigmore street; according to the Samuda advocates, the experiments were a complete failure; but in 1836 an association was formed for working under Mr. Pinkus' principle, and contracts were made for works, to demonstrate the principle. In 1836 Mr. Pinkus took out another patent for this country, with improvements, and also for foreign countries; in this the valve was formed of iron plates, secured to felt, to lay against pieces of wood, which he proposes to fix to the inner sides of the trough, as presenting a smoother surface than cast-iron: he also described a spring copper valve, fastened at its foot to the pipe, and meeting at the top in the shape of an inverted V. The system was then called the pneumatic system, and excited a good deal of attention, and much controversy. At this period works were designed to be applied on the West London Railway, at Wormwood Scrubbe; the works nearly completed a line half a mile in length, formed on the margin of the Kensington Canal, which was united with that line of railway; Messrs. Samuda and Hague were the contractors for the engines, the former also for the mains and valves. Mr. Clegg is claimed by Mr. Pinkus as having been at that time confidentially employed and consulted by him, and as having witnessed the progress of the experiments; and

these assertions of Mr. Pinkus we have not seen a satisfactory answer; certain it is, that on the 3rd of January, 1839, a patent was taken out by Messrs. Clegg and Samuda, from which practical results have been obtained. The grand principle of the improved atmospheric plan, up to this period, was hermetically sealing the valve with a composition each time the train passed. In 1838, experiments had been made on this plan at Chailot, through the exertions of Mr. James Bonfit. Next, an extensive experiment was performed on Wormwood Scrubs, on the West London Railway, Mr. Pinkus' apparatus having been removed, his company falling to the ground for want of funds. The portion of the line selected was half a mile long, with a rise of 1 in 120 for rather more than half the distance, and 1 in 115 for the remainder. On the 11th of June, 1840, this line was opened for experiments, and these were attended with sufficient success, and so far sanctioned by the approval of eminent engineers, as to justify further proceedings. We should observe, that on the 3rd August, 1839, Mr. Pinkus obtained a third patent, in which he describes a valve and composition precisely similar to Clegg and Samuda's; on the 21st March, 1841, a fourth, where he proposes a gaso-pneumatic power. About 1841, Mr. Bonfit set up at Havre, in the factory of M. Nilbus, machinery for manufacturing Clegg and Samuda's valve. At the close of 1843, Clegg and Samuda's plan was laid down on the Dalkey line for the short distance of one mile and a quarter; this is a continuation of the Dublin and Kingstown line. And in the subsequent history of atmospheric railways, we have last—but, as we imagine, not least—the extraordinary but simple invention of Mr. James Pilbrow, which obtained a patent on the 18th November, 1844; this invention does away with the continuous valve altogether, having many other advantages which preceding inventions cannot claim.

“As the two plans which now chiefly engage the attention of the public are that of Messrs. Clegg and Samuda, and that of Mr. Pilbrow, we purpose, in a subsequent part of this paper, to give a minute description of each of these plans, and a comparative estimate of both. At present we invite your attention to the general advantages of the atmospheric system above steam locomotive power. A diminution of expenditure is one of the most obvious advantages. In the original outlay there is not a necessity for that extensive levelling as is now required; engines of very great power will not be needed; the wear and tear of materials will be diminished; and, by consequence, the rates of charges for travelling will be lessened, and cheap travelling will be secured with a certainty of increased safety and comfort. This advantage of safety is one of paramount importance. The atmospheric system precludes all the terrible calamities of bursting boilers and burning trains, with which the public has become painfully familiar. Running off the line is also avoided, since, in the atmospheric system, the impelling power is at the centre of gravity, and must, from its action, keep the train on the rails. A collision of trains, from which such disastrous results have arisen, cannot possibly take place on the atmospheric principle. Then, not to enter into any metaphysical discussion of the question, how much the very consciousness of safety promotes our comfort—it may suffice to say, that the atmospheric system offers a full enjoyment of the

pure atmosphere of heaven as you quietly glide on by an invisible power, and entire freedom from the clanking of cumbrous machinery, flying sparks, hot cinders, and strong sulphuretted hydrogen. Another advantage is, increased speed—the average rate of travelling by the atmospheric power being fifty miles an hour, while the highest velocity of travelling on the fastest line, by steam, is thirty miles an hour; and, in a country where time is appreciated as property of great value, this must be considered of paramount importance did it exist alone; but when speed can be secured at less expense, and with increased safety and comfort, no doubt can exist to which system the most decided preference is to be given.

“The plans of atmospheric railways, now fairly before the public, claim our particular attention. The first we notice is that of Clegg and Samuda; and we cannot do better than give the description drawn up by M. Arago. We shall now say a few words on the manner in which they have contrived to establish an immediate and unyielding connexion between the piston, on which the atmosphere acts as a moving power, and the leading carriage of a train running outside the tube on the ordinary rails. This inflexible connexion, of which we have just spoken, could not be established conveniently, except by means of a metal rod passing from the piston to the carriage. Now, as it is necessary that this connexion should be maintained during the entire course of the piston, there must be a longitudinal opening in the upper surface of the tube. It is along this upper slit that the metal arm travels, by means of which the movement of the piston is communicated to the leading carriage of the train, and thence to all the others. This rod, or arm, has been very justly called the connecting or moving arm, or plate. But, it may be asked, if there is an opening in the tube, how is the vacuum to be produced? We give the reply. The opening is continued the whole length of a valve, by which it is hermetically closed; the vacuum can be thus successively produced in that part of the tube to the left and right of the piston, as in the closed tube, of which we have spoken in the commencement. By a movement, to which we shall presently refer, the valve is partially opened near the piston, so as to let the connecting plate pass; after which it immediately falls by its own weight. This is the most delicate part of the apparatus. If the valve actually closes the opening, a perfect vacuum is produced and maintained, by which we obtain a permanent and powerful moving force. On the contrary, should the valve allow the air to enter by any fissure, we cannot produce a sufficient vacuum but by having recourse to a very powerful air-pump—and, moreover, this imperfect vacuum can only be supported by the continual action of the pump. The longitudinal valve, which closes the opening of the tube, is formed of a strip of leather of indefinite length, strengthened above and below by a series of iron plates of about a foot long, and not leaving a space between them of more than three eighths of an inch. Weight is thus given to the valve without destroying its elasticity. The leather is closely and hermetically fastened by one of its edges to one side of the opening. The other edge remains unattached and movable; and, when the valve is closed, it merely rests on the second lip of the opening, which has been previously covered in its entire length by a composition of

wax or tallow. When the valve opens, that edge of the leather fastened to the tube bends, and thus acts as a true hinge. The valve is never raised to a perpendicular position; its movement never exceeds an angle of forty-five degrees. The mere falling of the valve by its own weight does not give it sufficient adherence to the edge of the opening, so as to prevent the entrance of air into the tube; therefore it scarcely resumes its place before it is heavily pressed by a wheel fixed at the back of the leading carriage, to which also is attached a cylinder filled with burning charcoal, for the purpose of melting the composition of tallow and wax by which the valve is held down. This is a full description of the Clegg and Samuda atmospheric railway. Did time allow, we might also notice a similar plan by M. Hallette, of Arras.

"We come now to notice the invention by Mr. Pilbrow, C. E., for which a patent has been taken out. Now this invention does not appear to be, like many of its predecessors, a mere improvement in some mechanical detail, but seems rather to be a new creation—a new system altogether. It might be asked, where Clegg and Samuda's patent differs from Pinkus', &c., or what have Clegg and Samuda done? but no one will find it necessary to investigate far to discover the difference here—no one will ask that question as to Pilbrow's. By this plan, the necessity for the continuous valve running along the upper part of the tube is entirely avoided; the connexion between the propulsive principle within and the carriages without being obtained in a manner entirely distinct. The propulsion tube, instead of being broken, or stopped at intervals of a few miles, extends unbroken for the whole distance. At intervals, on the top of the propulsion tube—say every thirty feet—there are placed boxes and supports. Within these boxes are cogged wheels or smooth-surfaced wheels, (a combination of the two, as the model is now before you,) working horizontally on an axle or shaft, the upper portion of which passes through an aperture in the top of the box, and at the outside, or above these boxes, the same axles are made to bear rollers or wheels similar to those inside the box. The passages through which the shafts pass are rendered air-tight by the shoulders or flat fillet turned upon the shafts. [The lecturer referred to diagrams.] Attached to the propulsion piston is a long rod or bar, nearly fitting the small square channel or tube, cast upon the propulsion tube; and, running along with the piston, is conducted by this smaller tube between the lower wheels. Either side of this bar is covered with cogs, or is smooth, or a combination of the two, as the case may be, [the lecturer referred to diagrams and model.] corresponding with the surface of the wheels within the boxes above described. It should be mentioned, also, that these wheels, or rollers, are made to project in a slight degree within the smaller tube. [The lecturer pointed out the distinction between the adhesion and cog plan; the latter not being indispensable, but, on the contrary, arrangements which many prefer.] As to the model in particular, which meets all the objections raised against other forms or arrangements of this invention, the manner of working the apparatus is simply this:—the air being exhausted from the propulsion tube, the piston, with its rod attached, is moved along inside it by the pressure of the external atmosphere; and, as it

moves, the rod works on the wheels on the inside, turns them round, and, as they turn the wheels outside, the boxes turn also. These external wheels are then made to act upon the train, by means of a rod attached to it, similar to that attached to the piston within; and thus, as the piston moves along inside the tube, the first carriage of the train moves along also over it outside the tube, through the medium of this double set of wheels and rods. In attempting to give a comparative estimate of these two plans, it is right to state that Clegg and Samuda's plan has most of the general advantages which atmospheric railways have over the present locomotive principle. The great distinction, however, between the system of Messrs. Samuda and that of Mr. Pilbrow is this—that in the former the connexion between the carriage train and the propulsion piston is direct; in the latter it is indirect, a third medium being employed. Another important distinction is that the Samuda system has the propulsion tube above ground, and has insuperable difficulties in crossing roads, and in intersecting other lines; the Pilbrow invention, placing the tube below the surface, gets rid of all the objections in regard to crossing and diverging lines from the main trunk. The continuous valve of the Samuda plan, must necessarily occasion much leakage, while the Pilbrow plan, dispensing with the valve altogether, no leakage from that cause can possibly arise. The leakage of Samuda's plan is equal to 5-horse power per mile, but Pilbrow's only 2½ horse power during the whole time of working every ten miles; the Samuda plan requires an exhausting engine at short intervals of about two miles and a half; the Pilbrow plan can be worked with only one engine at the interval of ten miles. The Samuda plan is remarkably complex, and, therefore, may be subject to frequent interruptions for repairs. As M. Arago inquires—'Can we hope for future success from a system, into which enters, as principal agents, a strip of leather of immense length, a composition of wax and tallow, and a hot iron to dissolve the wax?' Now, the Pilbrow plan is remarkable for its simplicity, and the fewness of agents employed. It is much to be lamented that the Pilbrow plan has been attacked, and difficulties ascribed to it, for which no grounds whatever exist—difficulties which have no existence whatever but in the imagination of the objector. Even the imagined difficulties must be frankly met, such as 'the fine ground metallic surfaces of the wheels soon being injured;' 'the friction and wear of the spindles by dust;' but the most formidable objection was stated against the use of cogs—that great speed would certainly break or strip the cogs. Now, the inventor has stated in his pamphlet, and in this room, (January 8.) that you may dispense with the cogs, and make use of adhesion, or a combination of the two, at high velocities, though it is right here to state, that an experiment has been made with the cogs at the rate of fifty-five miles per hour, and they did not break or strip. It, however, would be perfectly useless to spend time in refuting objections which have been either anticipated or already proved groundless."

One very important point which we deem it right to notice, is, that it is immaterial whether cog-wheels, threaded-grooved-wheels, or plain surface-wheels, be employed. The principle of the invention is the entirely new method by which

the impelling power is *connected* with the carriages. And this is the chief feature in the invention, together with the great principle which distinguishes it from every former invention, viz., the entire absence of any continuous valve.

From the Polytechnic Review.

LORD ROSSE'S TELESCOPE.

In the "Times" of the 16th April there is a letter from Sir James South descriptive of this magnificent instrument, and of some of the observations made by it: there is one upon the occultation of a star by the dark part of the moon, which produced a phenomenon that, Sir James says, is involved in impenetrable mystery. The following is the account he gives, and the solution which is now offered will, perhaps, render the matter apparent.

"On the 15th of March, when the moon was seven days and a half old, I never saw her unilluminated disk so beautifully, nor her mountains so temptingly measurable. On my first looking into the telescope, a star of about the seventh magnitude was some minutes of a degree distant from the moon's dark limb. Seeing that its occultation by the moon was inevitable, as it was the first occultation which had been observed with that telescope, I was anxious it should be observed by its noble maker, and very much do I regret that, through kindness towards me, he would not accede to my wish; for the star, instead of disappearing the moment the moon's edge came in contact with it, apparently glided on the moon's dark face as if it had been seen through a transparent moon, or as if the star were between me and the moon. It remained on the moon's disk nearly two seconds of time, and then instantly disappeared at 10h. 9m. 59.72s. sidereal time.

"I have seen this apparent projection of a star on the moon's face several times, but, from the great brilliancy of the star, this was the most beautiful I ever saw.

"The cause of this phenomenon is involved in impenetrable mystery."

Previous to the occultation, there existed a ray of light from the star to the eye of the observer. Now, whether the light is transmitted particle by particle, or whether light is transmitted by undulation, which the result of observations and the balance of probability renders the more certain, the following effect would be the same.

The ray of light represents the star in all its parts the moment the star is obscured by the passage of the moon, the star itself being fixed, the ray would not disappear until the time had elapsed which it takes to pass from the moon to the earth, a distance of 240,000 miles, this taking up two seconds of time or thereabout, the spectrum of the star would remain on the eye during that space, and then would instantly be lost. The moon itself continuing to advance would give the spectrum the appearance of passing a short distance upon its face, and, as Sir James says, leading us to suppose the star was seen through the moon.

Sir James South afterwards, in relation to the passage of the satellites of Jupiter over his face, asks the following question:

"Will the telescope tell us why the satellites of Jupiter, which generally pass over Jupiter's face as disks nearly of white light, sometimes traverse it as black patches?"

In endeavoring to solve the preceding question, we shall have to state a few facts about which

there is no dispute. The diameter of Jupiter is well known to be 94,100, while that of the earth is 7970. The largest of the satellites of Jupiter in its diameter is not equal to that of the earth. These respective diameters will give proportionate areas on the spheres of surfaces capable of reflecting solar light. The magnitude of these surfaces will give very different appearances of light according to the mass which they present, and consequently, the reflected light of Jupiter from its immense area, which is so much larger than the earth, although at a distance of more than five times that of the earth from the sun, will receive and reflect a far greater amount of light than the earth, or its own satellites, which will account for the intensity of the luminous appearance of Jupiter. We judge of the intensities of light by comparison; for instance, a board painted white will appear far darker than writing-paper, and writing-paper darker than snow newly deposited. The intensity of light, therefore, upon a satellite will be greatly less than that of Jupiter: but we must go a little farther; light is reflected most intensely precisely at the angle of incidence. Now the reflective spaces on a sphere of small dimensions are very greatly less from this circumstance than the space upon one of far greater area. If, for instance, any one will hang up a white ball and cast a ray of light upon it, he will find, excepting in the angle of incidence, which depends upon the situation of the eye of the observer, that the rest of the parts of the ball, as they recede from that angle, will become darker. Now, these being the premises, we ought not to be surprised at a satellite possessing so very small a comparative share of light, in respect to its primary appearing dark on passing over the most luminous part of Jupiter, although it may appear light when viewed separately from him, or even whilst passing over any of the less illuminated parts of the planet itself.

The small quantity of light that these satellites reflect, and not its intensity on the angle of incidence, is the reason that these satellites are not seen by the naked eye upon the earth.

We trust that the foregoing explanation is sufficiently evident, at the same time that we respectfully submit that if astronomers would make themselves masters of a little natural philosophy in addition to their great attainments as mathematicians, they would be able to solve not only many of the appearances of which we are now cognizant, and on which there seems to be an extraordinary degree of ignorance, but also to account for those new and important facts, which we fully depend upon being made known, by the further use and contemplated improvement, according to Lemaire's plan, in Lord Rosse's telescope, for the spirited and able construction of which his lordship has laid the scientific world under enduring obligations.

J. A. BORRON.

COLLEGE OF CHEMISTRY.—There is every reason to believe that this undertaking, as it is highly patronized, will be carried out. It is to be regretted that the schools already existing are not considered sufficient for the supply of accomplished chemists.

RAILWAY UNDER THE THAMES.—The plan for forming a railway through the tunnel, proposed by the late Mr. Samuda, has been submitted to the proprietors. The expense will not exceed ten thousand pounds.

From the Polytechnic Review.

ARCHIMEDEAN RAILWAY.

MR. FARRELL, the inventor of this curious system, exhibited a model at the Dublin Society's house during the late cattle show, and delivered a lecture on it in the gallery, which was densely crowded, on Wednesday the 23d ult. After alluding to the great advantages which have arisen from the invention of the railways, and to the merits and demerits of the various plans, Mr. Farrell, pointing to his model, said:—

"I have given this invention the title of 'Archimedean,' from some resemblance that it bears to the water-engine, invented by the celebrated Archimedes, which appears to have been a tube coiled spirally round a cylinder; but as a cylinder of eighteen inches diameter would be expensive and cumbrous, I substituted a comparatively small shaft of iron-tubing of about four inches diameter, and the spiral or thread of the screw I support by wrought-iron arms of sufficient strength, keyed on the shaft and bolted to the spiral. The screw propeller thus formed is made in separate lengths of from twelve to fifteen feet, and connected by couplings at each joint, that allow a sufficient freedom to meet any accidental sinking of the rails, or any required divergence from a straight line. These lengths rest on metal-bearing saddles that are bolted to the cross-sleepers of the railway. This screw propeller is laid down in the middle of the track, and caused to revolve upon its axis by steam or water power, and, when revolving, the spiral rail presses against a pair of wheels that are suspended from the frame of the leading carriage of the train, one wheel being at either side of the axis of the screw; so that while the carriage is propelled forward by the pressure of the spiral against the periphery of one of the wheels, it is prevented from acquiring accelerated motion or running irregularly forward by the other wheel, which follows and presses against the spiral on the other side of the axis, and thus aids in giving a revolving motion to the screw propeller. These wheels, which form the only connection between the trains and the propeller, are perfectly under the control of the conductor, who, by turning the handle of the vertical screw, can raise them up, and thus disengage them from the propeller, and, by continuing the same action, can apply the breaks to the bearing wheels, and thus stop the train at any point of the line. It is proposed that the stationary engines be placed three miles apart, and that each engine shall turn a mile and a half screw propeller in each direction from it; the power will be communicated from the engine by means of a friction-clutch, let into a cylinder cast on the back of the spur-wheel. By this means, should the shaft meet with any accidental obstruction, it will be saved from any strain. Thus far this invention is applicable to any existing railway; the propeller can be laid down and secured to the cross-sleepers of the railway, and the propelling wheels and lifting apparatus attached to as many of the carriages as would be required for leading carriages. The model, however, embraces another improvement. It may be seen that the wheels have no flanges, and there is a pair of friction wheels at either end of the carriage that run against the centre guide rail, that rests on, and is firmly secured to the apex of the triangular bearing saddles which support the propeller.

"The advantages I expect to be derived from this invention are economy in construction, economy in power for locomotion, and facility for transmitting frequent trains with perfect safety.

"The facility which the Archimedean possesses for ascending inclined planes, places it on a par in this respect with the atmospheric system, by which, as I have before shown, a saving in construction to the amount of 4000*l.* per mile may be effected, taking the estimate of the Irish railway commissioners as our standard. The relative estimates will stand thus: locomotive railway, 13,000*l.* per mile; atmospheric railway, including the tubes for double line, 18,000*l.* per mile; Archimedean, including the propeller for double line 11,000*l.* per mile; these amounts are given, it will be remembered, as merely comparative estimates. On the Archimedean system, therefore, the saving in the cost of construction, when compared with the locomotive, is 2,000*l.* per mile, and compared with the atmospheric, 7,000*l.* per mile of double line. With respect to the cost of locomotion, it will be sufficient for our purpose, as I have before stated, that the locomotive and the atmospheric systems might be considered nearly on a par as to annual expense, to compare the Archimedean with the locomotive system.

"As the power is conveyed directly from the prime mover to the trains by means of the screw, I cannot conceive that there is any power lost, except that which is absorbed in turning the screw propeller and keeping it in motion. The weight of a mile and a half propeller is about eighty tons. If we allow the power expended in turning this amount to ten-horse power, (and by the use of friction rollers this might be greatly reduced,) as I propose a twenty-horse engine to each three mile station of single way, and two such engines on a double line, which could work in concert, each engine would, therefore, have a spare power equal to the propulsion of more than 30 tons, at the rate of 20 miles an hour; and as trains might be transmitted in rapid succession without danger of collision, trains of 20 tons might be transmitted at the rate of 30 miles an hour without increasing the engine power, and thus meet the demands of the most extensive traffic, at a cost considerably under one fourth of the expense of locomotive power on the present systems. The saving would therefore be on a railway 100 miles long, 200,000*l.* in the cost of construction, which at five per cent. is 10,000*l.* per annum, and on the cost of locomotive 75,000*l.*, making a total annual saving of more than 80,000*l.* per annum on a line of 100 miles in length, of very extensive traffic." Mr. Farrell concluded by stating that, startling as those calculations appeared, he was persuaded they would be borne out by results.

ANASTATIC PRINTING.

MR. FARADAY commenced his lecture at the Royal Institution on Friday evening last, by expressing his fears that, not being in any way connected with the subject, he might not plead so zealously in its favor as he did when he brought before them his own inventions; but if he did not render the subject quite clear, it was to be considered as entirely his own fault, the inventor having placed every information at his disposal. He hoped to be able, even during the short time allotted to the lecture, to show practically the process, as the

workman, extremely skilful in the science, could show practically the working. The word "anastatic" signified, he was informed by scholars, a raising up; in other words, a revival of what might be considered as dead and useless. Having given this definition of the name, before showing its workings, he had most distinctly to repudiate the slightest intention of in any way recommending it or pledging himself for its success. However it might eventually turn out, his opinion could never be brought against him, for he had given none. He considered this caution necessary, as he found his name constantly brought forward as recommending this theory or that theory, or identified indeed with things with which he had not the slightest acquaintance. That very day, indeed, he had received a letter upon his supposed advocacy of perpetual motion. His duty was but to explain, as clearly and briefly as he could, the invention now before them. It consisted in a plan of printing from a printed page, or an engraving, any number of copies. He would, to show the principle, take at random a leaf from the book, and give it over to the worker, and they would see the process in all its stages. They would observe that he wetted first the print freely with dilute nitric acid. (The proportions the lecturer did not state, but we should judge its strength to be at least one of acid to four of water.) This was allowed to stand for some time—a few minutes would be sufficient in the present case; and they would next remark the extreme care of the worker to remove the excess of acid. This was effected by pressure between sheets of bibulous or blotting paper; this sheet was then placed upon a plate of polished zinc. He would draw attention to the extreme care with which the worker was polishing the plate; the slightest speck would be sufficient to injure the impression. His hearers would now see the system; the acid would soak through the paper, but on those places where the printing was the acid could not penetrate. Printers' ink, as they were aware, was composed of lamp-black and a preparation of linseed oil, and this effectually defended the plate from the acid. "The wetted paper and the plate are then submitted to heavy pressure between two rollers, and the plate is, as you see, strongly acted upon by the water; it is now washed with gum-water, and this, though an apparently unimportant part of the process, is of great practical importance; it would appear to have a most decided repulsive action on the ink. The plate can now be submitted to the action of the inken roller; the parts protected by the printing will alone receive the ink, and in order to render this more decided, the zinc plate is now washed with phosphoric acid; the action of this acid is exceedingly obscure; the phosphoric has no advantage over the nitric or muriatic, but the difference where the phosphoric is used is exceedingly apparent. Phosphoric acid is easily made, by leaving phosphorus in water exposed to the action of the atmosphere; the phosphorus absorbs oxygen, and forms the phosphoric acid. The worker, you see, uses considerable force in his operations with the gum-water and the phosphoric acid; his experience has shown him that the printing ink adheres now with some firmness, and you will be able to see the process of the printing. I hand over to the chairman, as your representative, the impression just worked off; you will, after the lecture, find it perfect. But it would be unfair to judge of the practical working by the process now

working amidst the excitement and bustle attendant upon the lecture. I will now call your attention to the repulsive action of water and oil. You are aware that when two smooth surfaces wetted with either oil or water are pressed together, they cohere with considerable force; there is but little difficulty in sticking them together, though my strength is hardly sufficient to tear them apart; this is not, as was formerly supposed, the cohesion of the surfaces, but the attraction of particles of water for water. We are indebted to Dr. Henry, of America, for the peculiarly instructive papers and experiments he has published, which, though out of place here, I hope, ere the season closes, to have the pleasure of again alluding to. (Great applause.) I will pour upon this plate some colored water, and drop on it some oil: the water is, you see, driven to the sides; and this effect is even seen more strongly when I cover first the plate with oil, and pour on the water: it slides, as you see, over the plate; each, as it were, keeps possession in defiance of the other, the first applied holding possession; and this is probably one cause why, after so many impressions, the printing keeps distinct, the repulsive action of the water pressing up the ink in place of allowing it to spread, even though it remains for some time soft. The possibility of taking impression by pressure has been well known a long time: by rubbing this newspaper strongly, with a piece of wood, against this damp paper, I can obtain a very fair impression, though the force I can employ is of course not for a moment to be compared to the even and powerful pressure of the printing press. Now metallic plates resist strongly water when very highly polished, though, as you observe, I may pour water on this plate: its surface is not tarnished; the water moves lazily, like a slug, upon its surface. A little mucilage will at once remove this difficulty; the gum enables it to spread smoothly over the surface. There is not quite sufficient mucilage here, (this experiment failed,) but on the addition of a little more the effect is at once apparent. But I will play further tricks with this plate; I will direct the man to rub off the impression from the plate—and this can be done easily by turpentine—and the plate will be to all appearance as before it was first submitted. Before doing so I will have first the plate entirely inked over; every part is now covered. I place my finger on any part, and you observe it covered with the ink, marking whatever I now touch. The worker will rub it with his cloth, and take an impression. You will observe that the rubber has moved the ink only from those places to which it was not first applied, and the printing is as clear as before. He will now move off the ink entirely, and you would believe that the plate was now destroyed: but no; the parts, once inked, though every atom of grease has been removed, will still receive only the ink, while the other parts will, as before, reject it; and again, you see, the printing goes on without hindrance. Eight thousand impressions have been, we believe, taken without the slightest difference between the first and the last in point of deterioration: indeed, the order of perfection is generally reversed, the first being the most incomplete. In the copying by this process the old printing, there was a great difficulty presented by the dryness of the ink, which becomes nearly brittle: to remove this the paper was sponged with a solution of potash: this would soften the ink. The potash was afterwards removed by soaking the paper in a

solution of tartaric acid. The paper becomes covered with the glistening crystals of bitartrate of potash, cream of tartar. These crystals refuse to mingle with, or to receive, the ink of the printers; and the printed parts alone receiving it, a very excellent impression can be made by reinking the print before it is applied to the plate. A few specimens are before you: their genuineness is at once apparent from the style of the type, which no printer of the present day would use."

From the Spectator.

LORD ROBERTSON'S POEMS.

ANY one who has visited Edinburgh from ten to twenty years ago, and been conducted to the Parliament House among other lions—or receptacles of lions—must remember an advocate of rotund proportions, whose pinguetude was to him a burden as the grasshopper to the seer of old. But

"His eyes twinkled in his head aright,
As don the stars in a frosty night."

The spirit within was not slumberous. A deft and well-trusted counsellor was he, and well-employed at the bar. But to see the man in his glory, you must meet him after dinner, or, by our lady, nearer hearing of "the chimes at midnight." Within his portly body seem encased the combined spirit of all high jinkers since the time of Pleydell. Speeches he could make in which there was no meaning—perhaps no wit; and yet the most saturnine were compelled to join in the roar they provoked. Gaelic sermons he would say, and Gaelic songs he would sing; though of the knowledge of Gaelic he was innocent; and bewildered Celts listened and could not tell whether it was or was not their own language that fell so glibly from his lips. Italian bravuras he could trol, albeit Italian was to him an unknown tongue and Nature had denied him a musical ear; De Begnis listening the while to his improvisation with delight, and Tamburini with blank astonishment. When the acute indefatigable advocate slipped out of his wig and gown and away from his multitudinous briefs, he could seem a very incarnation of one of Shakspeare's clowns. And, though he served no nobleman or potentate in that capacity, yet was he liegeman to an order. In those merry days, Edinburgh had its Guelphs and Ghibellines—its Dundasites and its believers in the old "Blue-and-yellow"—perhaps still has, for in provincial circles such feuds are nursed with an inveterate pertinacity, to metropolitan circles inconceivable,) and "Peter" was a staunch Tory. At a circuit-dinner in Jedburgh, some small Border laird grew angry because our hero marched out of the room before him, (unthinkingly, it may be, though in strict etiquette the precedence was his right,) and valorously demanded, "Who are you, sir?" "Who am I, sir?" responded the imperturbable Peter; "don't you know me, sir?" I am buffoon-general to the Tories of Edinburgh, sir!"

To an observant beholder there was something anomalous in the face of Mr. Patrick Robertson. His mouth was finely formed, and had an expression of delicate sentiment; and they who knew the man were aware that in the innermost recesses of his mind there was really a rich vein of fine thought and feeling. Generous he was, both in

the more vulgar acceptance of readiness to assist the poor and needy, and in an uncontrollable sympathy for worth that had suffered wrong. He could not even bear to see a blackguard treated worse than was absolutely necessary to keep him in order. His favorite books (and though few imagined he ever opened one, they were daily consulted) were poems: deep-read he is in Shakspeare and Milton; and Wordsworth's and Hunt's poetry are familiar to him. This trait in his character explains the volume of downright serious poetry which he has just given to the world. In part it may be believed to have been prompted by the irrepressible desire he felt to utter aloud the feelings awakened in him by the novel and striking objects with which he found himself encompassed during a tour in Italy, in the long vacation last autumn. Perhaps a desire to let the world know that better and deeper feelings lurked below the outer case of the professed jester may have had its influence. Viewed in this light, the fragments of verse in the volume now before us do no discredit to their author. Poetry it would be gross flattery to call them. The "Address to the Queen" reminds one—*tant soit peu*—of a speech on "the general question;" the attempt to impersonate Galileo and Milton has none of the novelty Lord Robertson flatters himself it possesses, and, what is worse, is a dead failure; while "The Dishonest Dealer" and "The Pirate" are mere versifications, the one of a speech in opposition to an application for the benefits of the *cessio bonorum*, and the other of a crown counsel asking a jury to return a verdict against some freebooter of the sea. But the *Leaves from a Journal* are replete with a feeling of poetry, if not with poetical ideas. And thus much at least may be said in favor of all the verse in the volume—if the ideas are prosaic, and not unfrequently commonplace, (as will be the case even with men of talent, when, accustomed only to express themselves in prose, they rashly take upon them the fetters of rhythm.) they are always the ideas of a man of sound sense and healthy generous feelings; if the metre halts at times and is always stiff, it at least shows that the writer has perused and reperused Milton until the cadence of the poet's verse has become familiar to him. Lord Robertson may hold up his head among his brother and sister amateur versifiers, confident that he is as good as most of them.

Yet will his volume give rise to a world of mystification. All the small fry of Scotch Tories—and all who at Offley's or the Cider Cellar have caught a transient glimpse of Peter before he was raised to the bench—will read on and on, ever expecting that next page the joking is to begin. His brethren on the seat of judgment will be flattered as by "an eagle in a dove's cut." The president will bluster, and the justice clerk look grave, thinking this publication of poetry by a Lord of Session *infra dignitatem*; Lord Jeffrey will pick out some felicitous turn of expression, and compliment him upon it; Lord Murray will hesitate between reluctance to give pain and incapacity to be insincere, and remain silent; and Lord Cockburn will say, that "whereas the muse of his country found Burns at the plough and cast the mantle of her inspiration over him, she found Lord Robertson on the bench and dropped on him a 'double gown' after government had ceased to bestow such honors."

OREGON.

It is convenient and desirable that the public in this country should be in possession of the views taken of the Oregon question by men of coolness and judgment on the other side of the Atlantic; and at the present moment the opinions contained in the last letter of our correspondent, "A Genevese Traveller," and in the speech delivered by Mr. Calhoun in the month of January, 1843, will have been read with the greatest interest. The argument of our correspondent scarcely touches the real merits of the case; it amounts simply to this,—that the Americans have on all occasions claimed the whole of the territory in dispute, and that the compromise they offered in 1826 is the utmost limit of concession on their part. We anticipated some weeks ago the difficulty which Mr. Polk might have to encounter, if he were disposed to conclude a convention on any terms less favorable to the United States than those which constituted the *ultimatum* of the commissioners of 1826, namely, the prolongation of the 49th degree parallel of latitude from the Rocky Mountains to the sea. But, in reality, those former abortive negotiations have nothing to do with the matter. If this was a question of absolute, indefeasible right to the territory, it would admit of no surrender and no delay on either side; but it is, on the contrary, a joint, indefinite, and abstract right, and it is only by some species of concession or partition that it can ever receive any concrete shape or real character at all. The opinion of Mr. Gallatin is reported to be, "that the American claim to Oregon up to the 49th degree of latitude is clear and indisputable; beyond that point to the 55th degree it is fairly the subject of argument and

compromise." Whereas the opinion of the best authorities in this country is precisely the inverse, namely, that the British claim from the 55th to the 49th degree is clear, indisputable, and exclusive, but that south of the 49th degree the territory is open to joint occupation and ultimate partition. This is the view taken by the French writer, M. Duflot de Mofras, as the most favorable to the Americans which he can at all bring himself to entertain; and it is the principle upon which alone Mr. Huskisson and Mr. Addington negotiated on behalf of the British government in 1826. In point of fact, however, this distinction with reference to the 49th parallel of latitude appears to us to be arbitrary and unfounded; that line has never been mentioned in any of the earlier treaties; and it has now crept into the discussion apparently for no better reason than that it is the boundary of the two states east of the Rocky Mountains established by the convention of 1818.

It is, however, to be feared that the unsuccessful negotiations which were terminated by the temporary convention of 1827, will materially embarrass both parties in the course of that arrangement which is now pending. The question we are trying to untie has unluckily run into a knot; and neither country cares to yield one jot more than it would twenty years ago;—a memorable example, be it observed, of the danger of abortive attempts at negotiations, when the very fact and cause of a former failure becomes hereafter a serious aggravation of the real difficulty! In this instance, as between the two parties to the dispute, the point of honor thus raised long ago has more real weight than the geographical merits of the case or the actual amount of interest. But it is by the merits of the case and the fair interests of

the parties that the controversy ought to be decided; and the only mode in which such a decision can be obtained, with a perfect safety to the honor of both states, is by the arbitration of a third power. This is the expedient which the British government has more than once urged on that of the United States.

We have already stated, on a former occasion, what, in our opinion, ought to be the alternative—namely, a notice on the part of the British government, that the convention of 1827 shall terminate at the expiration of twelve months. But this opinion, which has not been lightly taken up, receives the strongest corroboration from the language used by Mr. Calhoun, in January, 1843. Assuming the rights of the two nations in Oregon to be equal, and the resolution to defend those rights to be on both sides the same, the late American Secretary of State pointed out to the Senate, in the most forcible language, the absolute impossibility of sustaining a contest with Great Britain at the present time in and for the Oregon territory. That coast is separated from our mighty eastern establishments by only a few weeks' sail across the Pacific; an American squadron must circumnavigate Cape Horn by a route of 18,000 miles before it could reach the Columbia. By land the difficulties are still more insurmountable; for who ever transported an army across 1,200 miles of pathless desert, where the only food to be obtained is the game still in undisturbed possession of those midland solitudes! The country is, as we have repeatedly observed, inaccessible to any people or any forces but our own; and moreover, it is already in the possession of our Hudson's Bay Company.

"But," says Mr. Calhoun, after establishing these certain, though unpalatable facts, "the way by which Oregon can be secured is to bide our time. All we want to effect our object in this, is *wise and masterly inactivity*." He repeats Mr. Greenhow's recommendation, which we quoted on a former occasion, to let the matter rest until the forces of the claimants are somewhat more equal than they are at present; and this is the only argument, be it observed, which has been used to restrain the American people. If you snatch at it, they are told, it is lost; if you wait, it is yours.

And is this argument to be lost upon us? Can we doubt that if this aggressive policy is bequeathed to another generation of Americans it will be faithfully carried out against another generation of Englishmen? Are we to stand unmoved, or to wait with stolid complaisance, because our aggressor tells us he is not quite strong enough at present to fulfil his intentions and wrest a province from the dominions of the crown? Are these fair conditions of joint occupancy, or an honest interpretation of an amicable convention? Fortunately for ourselves, Mr. Polk thought fit to throw off this "wise and masterly inactivity," and to tell the citizens of the United States that he is prepared to use all his constitutional powers for the immediate prosecution of what he terms their clear and unquestionable rights. It might have appeared overbearing if this country had availed herself of the superior advantages of her position to demand a settlement of the Oregon question, and had used menacing language in case of a refusal. But these pretensions have been raised by the other, and, as we believe, the weaker side—weaker both as to the merits of the case and as to the power of supporting it. The time for inactivity is past, for that is the very weapon

which we are told, by the best authority, is to be used against us. It is still as desirable and as possible as it has ever been, that the question should be settled by an equitable arrangement, sanctioned, if necessary, by an arbitration. But if the American cabinet slinks back into that inactivity of which we now thoroughly understand the meaning and the motive, it becomes the British ministers to put an end to a convention that only affords a cloak for hostile designs against a British province, which have been already openly avowed by the President of the United States, and are only postponed by the superior craft of other American statesmen.

From Bell's Messenger, 17 May.

OUR RELATIONS WITH AMERICA.—American papers have arrived to a late date, and we are happy to say that they fully justify our anticipation that there is no fear of war between Great Britain and the United States. Indeed, as regards the American government, all common sense was opposed to such an apprehension. As the Oregon district is the terminus with the Western American boundary, there is absolutely nothing but the physical difficulties of the journey to prevent the immigration of American citizens in any numbers or at any time, and there is not a power on earth which could prevent their settlement in this disputed district at pleasure. There is nothing to prevent them going either singly or in masses, and there is no power can reach them to prevent their settlement, or afterwards to dispossess them. They are wholly beyond the reach of fleets and armies. Under such circumstances it is obvious that nothing is wanting but time to put them in as full an occupation of the country as they could desire. Mr. Calhoun, one of the oldest members of Congress, seems fully aware of this circumstance, and in answer to a former proposal for more decided measures upon this point, concluded his speech with the following emphatic words:—"If the house would take my advice, they will let the matter rest, until by the course of time the forces of the claimants become more equal than they are at present. The way by which Oregon is to be secured is to bide our time. All we want to effect our object in this case is a wise and masterly inactivity."

The majority of the American papers now arrived, entirely adopt this view of the case. "We do not believe," says one of them, "that there is any hazard of war. The question is preëminently one for arbitration. Great Britain, as heretofore, has offered to submit it to arbitration under the most liberal conditions. Should this offer be renewed, we have no hesitation in saying that it should be at once accepted. We should run no risk of losing anything to which we have a right; and when rights are conflicting, mutual concessions which a neutral party would deem just, should then reconcile them."

If it should be objected that the British government is now so committed, that in point of honor and dignity we cannot ourselves come forward with this offer, the American papers here also afford a very satisfactory answer; so far at least as regards the leading point that, in fact, there is no apprehension of any war. It appears by the journals now arrived, that the American government itself is about to imitate this proposal of referring the whole matter to arbitration, and some of them proceed to the length of stating that Mr. Van Buren has been selected as the Minister to England for this purpose. Our own opinion is that it will come to this.

From Chambers' Journal.

DR. EDWARD JENNER.

THIS celebrated man, the discoverer of the art of vaccination, was born in the vicarage of Berkeley, in Gloucestershire, on the 17th of May, 1749. He was the third son of the vicar, and his mother was descended from an ancient and respectable family in the neighborhood. Losing his father at an early age, he was indebted for his education to the care and solicitude of an elder brother. Young Jenner chose the profession of medicine, and after acquiring the elements of the art at Sodbury, near Bristol, he went to London, and became a pupil and inmate of the celebrated John Hunter. From this enthusiastic and successful cultivator of the science of life Jenner caught the true art of philosophic investigation. They instantly became friends, and this friendship continued during life. Having finished his preliminary studies, he now returned to his native village to practise his profession. Other offers were then and subsequently held out to him, but his love of the country made him proof against them all. He was indeed a true lover of nature. With an inquiring and ever active mind, which prompted him to the investigation of nature's works, he had also that deep feeling of the beautiful and fair which accompanies a poetic temperament. His professional journeys through the district were lightened and diversified by scientific pursuits, and many of his leisure hours devoted to discoveries in natural history. His remarks on the singular and anomalous habits of the cuckoo excited the attention of the members of the Royal Society, and found a place in their printed transactions.

But one subject took possession of his mind, and engrossed his chief attention even from his earliest youth. In the great dairy county of Gloucestershire, where his inclination, and, it may be said, his destiny had placed him for a great purpose, it was a prevalent opinion that a disease was communicated from the teats of the cows to the hands of their milkers, by which the latter were ever afterwards protected from small-pox. While Jenner was a student at Sodbury, a young country woman came to seek advice. The subject of small-pox was mentioned in her presence: she immediately observed, "I cannot take that disease, for I have had cow-pox." This incident riveted the attention of Jenner, and the impression then made took full possession of his mind, and was never effaced. He communicated his views some time afterwards to John Hunter, who, although he had not turned his mind to the subject, was far from stifling any inquiry of the kind, and who, in his characteristic way, replied to the young philosopher, "Don't think, but try; be patient, be accurate." From his professional friends in the country, however, his theory met with nothing but discouragement: they, too, as well as Jenner, had heard the vulgar reports of the country people; but the circumstance was so out of the common routine, that they gave it no credit, and never thought of putting it to the test of experiment. In vain did Jenner urge on the discussion of the subject at their professional meetings—they refused to listen, and even laughed him to scorn. But Jenner, though he was thus compelled to fall back upon his own solitary thoughts, was not the character thus to be persuaded from his pursuit; like every man destined to achieve great things, he was firm of pur-

pose. For twenty years he brooded over the subject, collected facts, and made experiments; till at last, being fully convinced in his own mind that he had compassed the whole bearings of the subject, he came to the resolution of presenting the great discovery as a gift to mankind. The conclusions to which he arrived were as follows:—

The disease called *variola*, or small-pox, is common to man, and to several of our domestic animals, as the cow, horse, goat, &c.; but while in man it presents a severe and virulent disease, in passing through the system of brutes it becomes a mild and innocent affection.

The heels of horses are often affected with this disease, which, though frequently accompanied by what is called grease, is not identical with this latter. If a portion of the matter from the *vesicles* or little blisters on the heel of the horse, be taken and applied to the nipples of the cow, the peculiar disease is communicated to the cow; or, on the other hand, the horse may be infected from the cow. Matter taken from the vesicle of the horse or the cow, and inserted below the skin of the human subject, produces there a similar vesicle of a peculiar nature, which, running its course, protects the individual from an attack of the small-pox.

In order to insure complete success in this operation, certain cautions are necessary. The lymph must be taken before the expiry of a certain number of days, and the person to be vaccinated must be free from any other disease of the skin. Unless these conditions are attended to, a true vaccine disease will not be produced, and consequently no protection will follow.

In the true small-pox, it is a well-ascertained fact, that occasionally there are cases where persons who have gone through the disease regularly have again been seized with a second attack.

The same thing holds true with cow-pox. Although the great majority of those vaccinated are forever afterwards protected from the disease, yet cases occur where, after vaccination, an attack of small-pox has followed.

Vaccination, then, though not an absolute and universal protection, is as much so as small-pox is from a second attack of the same; with this important recommendation, that it substitutes a mild and harmless affection, or rather, it may be called, a remedy, for a violent and dangerous disease.

Even in those rare cases where small-pox occurs after the most careful vaccination, the disease is always mitigated, and very rarely proves fatal.

Such are briefly the conclusions to which Jenner had arrived at this early period of his investigations; and as a proof of his superior sagacity and accuracy of observation, it may be stated that little more has ever been added to his great discovery, and that subsequent experience has only illustrated the truth of his opinions and the efficacy of his practice.

The first "Inquiry into the Nature of Cow-Pox," published by Jenner, was a calm, philosophical, and extremely modest statement of his discoveries; and perhaps on this account it was received with the greater favor by the reflecting portion of the public. Some writers have hinted that he too sanguinely maintained the efficacy of cow-pox, and its future power of totally extirpating small-pox. Some degree of enthusiasm might be pardoned in the original discoverer of such a remedy; but on candidly comparing Jen-

ner's conclusion with the facts which have subsequently occurred, there seems nothing overstrained, and little that can be deducted from his statements.

In the spring of 1780, while riding in company with one of his earliest and dearest friends, his mind being full of the subject, he ventured to unbosom himself of his cherished hopes and anticipations; and after a detail of his opinions—"Gardner," said he, "I have intrusted a most important matter to you, which I firmly believe will prove of essential benefit to the human race. I know you, and should not wish what I have stated to be brought into conversation; for should anything untoward turn up in my experiments, I should be made, particularly by my medical brethren, the subject of ridicule, for I am the mark they all shoot at."

It was not, however, till 1796, on the 14th day of May, that the first attempt was made to convey, by artificial means, the vaccine virus from one person to another. On that day Jenner took some matter from the hand of Sarah Nelones, who had been infected by her master's cow, and inserted it by two slight scratches of a lancet into the arms of James Phipps, a healthy boy of eight years of age. The disease took effect, and went through its stages in the most regular and satisfactory manner. But now the most agitating part of the experiment remained: it was necessary to ascertain whether this boy was secured from the infection of small-pox. In the following July, variolous matter was carefully inserted into his skin by various incisions, and to the delight and satisfaction of Jenner no disease followed—the protection was complete. He now pursued his experiments with redoubled ardor: the goal of all his ardent hopes was seen close at hand. It was his custom at this time to meditate much as he rambled in the meadows under the castle of Berkeley. He has left us a picture of his feelings at this period full of interest:—"While the vaccine discovery was progressive, the joy I felt at the prospect before me of being the instrument destined to take away from the world one of its greatest calamities, blended with the fond hope of enjoying independence and domestic peace and happiness, was often so excessive, that, in pursuing my favorite subject among the meadows, I have sometimes found myself in a kind of reverie. It is pleasant to me to recollect that these reflections always ended in devout acknowledgments to that Being from whom this and all other mercies flow."*

It was in 1798 that Jenner's discovery was first published. His intention was, that it should have appeared in the Transactions of the Royal Society; but the subject was so strange, so novel, and, withal, so improbable, that some of the learned members hinted in a friendly manner that he should be cautious not to diminish, by any other doubtful discovery, the partial fame which his account of the cuckoo had already gained him. Such facts as these impart some idea of the difficulties his discovery was doomed to encounter. On the publication of his "Inquiry," he proceeded to London in person, in order to exhibit to the profession there his process of vaccination, and the success attending it. But—will it be believed!—he remained two months there, and at last returned home without getting any medical man to make trial of it, or any patient to submit

* Barron.

voluntarily to the simple and harmless process. That process, which in a few years afterwards millions of individuals eagerly availed themselves of, could not be exhibited, even for a bribe, in a single being. It was only after his return home that Mr. Cline, the surgeon, almost clandestinely inserted the matter into a patient, by way of an issue for a diseased joint! Yet it is a wise provision of affairs in this world, that truth will at last and infallibly prevail. The subject of vaccination began to engross public attention; and although many were incredulous, and scoffed at the matter, as is ever the case with what is new and uncommon, yet many, on the other hand, had faith to make trial of it; and finding success attend their experiments, the practice of vaccination extended on all hands. But there never was a discoverer yet who has not in a greater or less degree suffered martyrdom—the ignorant, the envious, the narrow-minded, the purely malicious, forever hang on the footsteps of the discoverer, irritating and obstructing his progress, and raising a clamor in which they hope the sober and subdued voice of truth will be drowned. Poor Jenner passed many harassing days and sleepless nights, less fearful about the wreck of his own honest fame, than for the success of his great and darling project. He had to answer every blunderer, who, in spite of the plainest directions, was sure always to go wrong in the most essential points—every failure of every careless experimenter was laid to his door—he was caricatured as a magician, who by and by would turn the human race into cows; and, baser than all, some of those who at one time scoffed at his theories, and despised his attempts to put them into practice, now endeavored to avert the discovery from Jenner entirely, if not to appropriate it to themselves. Yet time and circumstances, and his own tact and perseverance, seconded by his unyielding confidence in his opinions, brought him many friends and supporters. "The drop of pearl upon a rose-bud," as he poetically described the vaccine vesicle to the great statesman Fox, was such a simple, and easy, and beautiful substitute for the loathsome and dreaded blotches of small-pox, that the public at large, and more particularly the female part of it, became the warm and active propagators of the limpid virus. From Britain the practice extended rapidly to the continent. In America, the early cases were most successful; and at last the remotest countries in the world began to share its benefits, till there was not a corner of the peopled globe where the name of Jenner did not become familiar, and where his life-preserving process was not eagerly adopted. Among the many honors and acknowledgments which now and afterwards continued to be poured in upon him, not the least interesting was a document from a race of the North American Indians, authenticated by the symbolical signatures of their chiefs.

The discovery of vaccination now evidently appeared as a manifest boon to mankind. In several countries on the continent of Europe, where the nature of the government allowed of a free control over the habits of the people, the practice of vaccination was so systematically pursued, that small-pox was almost entirely eradicated. In the British navy and army, under a similar surveillance, small-pox was also unknown; but though in the British dominions several vaccinating boards were instituted, yet from the habits of the people, and the absence of a compulsory law, vaccination

was not there, and never yet has been, so complete and universal as to banish entirely the lurking malady of small-pox from our shores.

Considering, however, what devotion Jenner had bestowed on the subject, both theoretically and practically; considering the generous and disinterested manner in which, the moment that he became acquainted with its perfect efficacy, he hastened to lay his discovery before the world, his claim to a national compensation and reward could no longer be denied. In 1802 a committee of parliament was appointed to investigate his discovery, and decide on a remuneration. Of the many claimants on national bounty, few ever came forward with better pretensions than Jenner. Yet much caution was employed; and, in the first instance, a grant of only £10,000 was voted, subject to the delays and deductions of fees with which such grants are too often encumbered. This, as Jenner and his friends affirmed, was barely equal to the expenses he incurred, considering his multifarious correspondence, as well as his relinquishment of private practice, and the actual toil of responding to the queries from every region of the globe. Yet it is not to be wondered at if parliament had a wary suspicion of the reports of cures of any kind; for who does not hear of wonderful cures accomplished every day, and well-authenticated also, and yet experience, or further inquiry, proves them all ultimately fallacious; nor could it be forgotten that half a century had not elapsed since the same parliament voted its thousands for a nostrum which was utterly worthless. Happily for the fame of the legislature, however, and for the honor of the country in all future times, in the present instance it judged aright: even its caution was commendable: and allowing an interval of five more years, a further grant of £20,000 re-deemed their sense of the progressive importance and continued efficacy of the vaccine discovery. In the mean time, Jenner had taken up his residence in London, with a view to the better furtherance of the interests of vaccination, and with an idea of establishing himself in practice in the metropolis. But his was not a character fitted for the artificial bustle of the vast city, or the jarring conflicts of professional interests; his mind sickened amid the smoke, as one of his own meadow cowslips would have done, and he hastened back to his fields and his pure country air, and never left his beloved village again.

But he did not return to apathy or indolence. In London some finessing on the part of his professional brethren prevented him from acting as director of the national vaccine board, to which he had been in the first instance appointed; but now, in his own words, he retired to be "director-general to the world." In addition to this, the country people from all the districts around flocked to him for the benefits of vaccination, and his time and skill were ever at the service of the poor. He now, too, enjoyed his favorite pursuits of the study of nature, and shared his leisure hours among his fossils, his birds, his flowers, and the society of his family and his friends. Of every man who has achieved great things, we have a desire to know something not only of his thoughts and habits, but of his personal appearance. An early sketch of Jenner is thus given by his friend Gardner.

"His height was rather under the middle size; his person was robust but active, and well

formed. In his dress he was peculiarly neat, and everything about him showed the man intent and serious, and well prepared to meet the duties of his calling. When I first saw him, it was on Frampton Green. I was somewhat his junior in years, and had heard so much of Jenner of Berkeley, that I had no small curiosity to see him. He was dressed in a blue coat and yellow buttons, buckskins, well polished jockey boots, with handsome silver spurs, and he carried a smart whip with a silver handle. His hair, after the fashion of the times, was done up in a club, and he wore a broad-brimmed hat. We were introduced on that occasion, and I was delighted and astonished. I was prepared to find an accomplished man, and all the country spoke of him as a skilful surgeon and a great naturalist; but I did not expect to find him so much at home in other matters. I, who had been spending my time in cultivating my judgment by abstract study, and smit from my childhood with the love of song, had sought my amusement in the rosy fields of imagination, was not less surprised than gratified to find that the ancient affinity between Apollo and Æsculapius was so well maintained in his person." At a later period, his biographer, Dr. Barron, then a young man, thus gives an account of a first interview with him. "He was living at Fladong's hotel, Oxford street, in the summer of 1808, making arrangements for the national vaccine establishment. The greatness of his fame, his exalted talents, and the honors heaped upon him by all the most distinguished public bodies of the civilized world, while they made me desirous of offering my tributes of respect to him, forbade the expectation of more than such an acknowledgment as a youth circumstanced as I was might have expected. I soon, however, perceived that I had to do with an individual who did not square his manners by the cold formality of the world. He condescended as to an equal. The restraint and embarrassment that might naturally have been felt in the presence of one so eminent, vanished in an instant. The simple dignity of his aspect, the kind and familiar tone of his language, and the perfect sincerity and good faith manifested in all he said and did, could not fail to win the heart of any one not insensible to such qualities. He was dressed in a blue coat, white waistcoat, and nankeens. All the tables in his apartment were covered with letters and papers on the subject of vaccination. He spoke with great good humor of the conduct of the anti-vaccinists, and gave me some pamphlets illustrative of the controversy then carrying on. The day before I saw him, he had had an interview with the Princess of Wales, and he showed me a watch which her royal highness had presented to him on that occasion." The same friend, at a much later period of their acquaintance, again remarks—"Dr. Jenner's personal appearance to a stranger at first sight was not very striking: but it was impossible to observe him, even for a few moments, without discovering those peculiarities which distinguished him from all others. The first things that a stranger would remark were the gentleness, the simplicity, the artlessness of his manner. There was a total absence of all ostentation or display, so much so, that in the ordinary intercourse of society he appeared as a person who had no claims to notice. He was perfectly unreserved, and free from all guile. He carried his heart and his mind so openly, so undisguisedly, that all might read them. His profes-

sional avocations, and the nature of his pursuits, obliged him to conduct his inquiries in a desultory way. At no period of his life could he give himself up to continued or protracted attention to one object: there was, nevertheless, a steadiness in working out his researches amid all the breaks and interruptions which he met with, that can only belong to minds constituted as his was."

With all the simple and genial qualities of an unsophisticated heart, Jenner had, when the occasion required, all the firmness and dignity becoming a man conscious of the possession of talent. On one occasion, in the drawing-room of St. James', he chanced to overhear a noble lord mention his name, and repeat the idle calumny which had got abroad, that he himself had not really confidence in vaccination. He with much promptitude refuted the charge, and stepping up to the noble lord, to whom he was unknown, calmly observed, "I am Dr. Jenner." Any unpleasant recollection of this circumstance was most likely, on the part of Jenner, soon dissipated; but not so with the noble statesman; his remarks some time afterwards, in his place in parliament, when Jenner's claims came to be discussed, showed that he had not forgotten it.

When the continental sovereigns visited London in 1814, Jenner was presented to the Emperor Alexander of Russia by his sister, the grand duchess of Oldenburg. In describing this interview, he says, "I was very graciously received, and was probably the first man who had ever dared to contradict the autocrat. He said, 'Dr. Jenner, your feelings must be delightful. The consciousness of having so much benefited your race must be a never failing source of pleasure, and I am happy to think that you have received the thanks, the applause, and the gratitude of the world.' I replied to his majesty that my feelings were such as he described, and that I had received the thanks and the applause, but not the gratitude of the world. His face flushed; he said no more; but my daring seemed to give displeasure. In a short time, however, he forgot it, and gave me a trait of character which showed both great goodness of heart and knowledge of human nature. My inquiries respecting disease of the lungs had reached the ears of the grand duchess, the most interesting being that I had ever met with in a station so elevated. She was present, and requested me to tell to her brother, the emperor, what I had formerly said to her imperial highness. In the course of my remarks I became embarrassed. She observed this, and so did the emperor: 'Dr. Jenner,' said she, 'you do not tell my brother what you have to say so accurately as you told me.' I excused myself by saying that I was not accustomed to speak in such a presence. His majesty grasped me by the hand, and held on for some time, not quitting me till my confidence was restored by this warm-hearted and kind expression of his consideration."

As his life was an active and benevolent, so, on the whole, may it be termed a prosperous and a comparatively happy one. Latterly, he had domestic afflictions, which to a sensitive heart are the heaviest of sorrows. He lost his favorite son, his newly-married daughter, and at last his amiable wife, whose delicate constitution he had tended with all the assiduity which deep affection and respect could dictate. He reached a good old age, with his general health and mental powers unimpaired to the last. On the 26th January, 1823, he

died suddenly of apoplexy, in the 74th year of his age. He lies buried in the chancel of the church at Berkeley, where a monument has been erected to his memory by his professional brethren.

It is now almost half a century since the first introduction of vaccination, and at least forty years since its general adoption—a sufficient time, one would think, to test its efficacy, and yet there are several circumstances relating to it which have not yet been definitely determined. In the first place, it cannot be denied that on the whole it has been a successful remedy, and that it has produced a remarkable effect on the general population. Small-pox, if it has not been entirely eradicated, has been disarmed of most of its terrors; and notwithstanding the cases of failure of protection from its ravages which occasionally occur, yet the general confidence never has been withdrawn from the practice of vaccination.

Both before and since the death of Dr. Jenner, it became known that cases sometimes occurred where persons who had been vaccinated were seized with small-pox. At first, it was supposed that those cases were instances where vaccination had not taken proper effect, either from an imperfect quality of the virus used in vaccination, or from a peculiar habit of the person vaccinated. But it was afterwards ascertained that persons in whom the process had been practised with the utmost care, and in whom the disease appeared to go through its course in the most favorable manner, were yet not protected from small-pox. It is true, in all these cases of seizure the affection was of a much milder kind than even the inoculated small-pox, and in a very small proportion indeed did death occur, perhaps not one case in several thousands; yet there could be no doubt but that the disease was in reality true small-pox, under a mild and modified form.

It became evident, then, that there were exceptions to the universal protection against small-pox, and that this disease might occur after vaccination, just as an individual might be seized with a second attack of small-pox. This was a fact known to Dr. Jenner even before he gave his discovery to the world. In his early pursuit of the inquiry he was much staggered by it, but further experience enabled him to perceive that it was only an exception to a general rule; and all experience since, both in public vaccine institutions and in private practice, has only tended to confirm it.

Seeing, then, that such exceptions from time to time continued to occur, and as they multiplied in number by time and the general diffusion of vaccination, another question began to be agitated—whether the vaccine matter, by passing through innumerable human beings, had not lost its character and consequent efficacy; and whether it would not be necessary again to have recourse to the cow?

The most experienced vaccinators seem to give no countenance to this opinion. They affirm that the character of the vaccine vesicle is exactly the same, and its development, in all its stages, as regular and complete as it was when first discovered; and that, when compared with vesicles produced by matter directly from the cow, there is no difference; that even in the early stages of the employment of vaccination, failures, as already stated, began to appear; and that these failures are probably not more in proportion now than they were then.

A suggestion of another kind has been advanced—that probably the protection of the vaccine matter is only of a temporary nature, and that it becomes exhausted in the course of time, and thus leaves the constitution open to an attack of small-pox. If this had been the case, then in the course of the last forty-five years all those persons vaccinated should have by this time successively had attacks of small-pox when exposed to infection. This, however, has by no means happened; so that the fact cannot be true as a general rule, though, as we shall afterwards state, it may hold in some respects as regards individuals at different periods of life; and thus the propriety of a second vaccination about the age when the individual is entering on the period of manhood has been frequently suggested.

Taking all these exceptions into account, there can be no doubt but that the practice of vaccination, with its partial drawbacks, has been an inestimable boon to mankind. It has been ascertained that every fourteenth child born was cut off by small-pox; and that in most cases where adults were infected, a death occurred out of every seven. If to this we add the other fatal diseases called into action by this malady, the influence on the increase of population by the check it has received from vaccination must be held to be very considerable. We accordingly find that, previous to 1780, the annual mortality in England and Wales was rated at one in forty; whereas at the present time it is one in forty-six. No doubt other causes have combined to improve the general health, but that the preventive power of vaccination has been mainly instrumental, appears, even from the diminished deaths from small-pox, sufficiently evident. Indeed, we have only to call to mind the scarred and pitted faces, marred features, and opaque and sightless eyeballs of former days, to be convinced of the essential service which has been rendered to the community.

From Chambers' Journal.

SOPHIA OF WOLFENBUTTEL.*

CAROLINA CHRISTINA SOPHIA of Wolfenbittel, sister of the wife of the emperor Charles VI., was united in marriage to the Prince Alexis, son and presumptive heir of Peter the Great, czar of Muscovy. In her were mingled the fairest gifts of nature and education: lovely, graceful, with a penetrating and cultivated mind, and a soul tempered and governed by virtue; yet with all these rare gifts, which softened and won every other heart, she was nevertheless an object of aversion to Alexis, the most brutal of mankind. More than once the unfortunate wife was indebted for her life to the use of antidotes to counteract the insidious poisons administered to her by her husband. At length the barbarity of the prince arrived at its climax: by an inhuman blow, he reduced her to so wretched a state, that she was left for dead. He himself fully believed that which he so ardently desired, and tranquilly departed for one of his villas, calmly ordering the funeral rites to be duly celebrated.

But the days of the unfortunate princess were not yet terminated. Under the devoted care of the Countess of Konigsmark, her lady of honor, who had been present at the horrible event, she

slowly regained health and strength, while her fictitious obsequies were magnificently performed and honored throughout Muscovy, and nearly all the European courts assumed mourning for the departed princess. This wise and noble Countess of Konigsmark, renowned as the mother of the brave marshal of Saxony, perceived that, by not seconding the fortunate deceit of the Prince Alexis, and the nation in general, and by proclaiming her recovery, the unhappy Princess Carolina, already the sport of such cruel fate, would expose herself to perish sooner or later by a more certain blow. She therefore persuaded her wretched mistress, who had scarcely strength to undertake the journey, to seek refuge in Paris, under the escort of an old man, a German domestic. Having collected as much money and jewelry as she was able, the princess set out, with her faithful servant, who remained with her in the character of father, which he sustained during his life; and truly he possessed the feelings and tenderness, as well as the semblance, of a parent.

The tumult and noise of Paris, however, rendered it a place of sojourn ill adapted to the mind of Carolina, and to her desire of concealment. Her small establishment having been increased by a single maid-servant, she accordingly embarked for Louisiana, where the French, who were then in possession of this lovely portion of South America, had formed extensive colonies. Scarcely was the young and beautiful stranger arrived at New Orleans, than she attracted the attention of every one. There was in that place a young man, named Moldask, who held an office in the colony; he had travelled much in Russia, and believed that he recognized the fair stranger; but he knew not how to persuade himself that the daughter-in-law of the Czar Peter could in reality be reduced to so lowly a condition, and he dared not betray to any one his suspicions of her identity. He offered his friendship and assistance to her supposed father; and soon his attentive and pleasing manners rendered him so acceptable to both, that a mutual intimacy induced them to join their fortunes, and establish themselves in the same habitation.

It was not long before the news of the death of Alexis reached them through the public journals. Then Moldask could no longer conceal his doubts of the true condition of Carolina, and finding that he was not deceived, he offered with respectful generosity to abandon his pursuits, and to sacrifice his private fortune, that he might reconduct her to Moscow. But the princess, whose bitterest moments had been there passed, preferred, after her adventurous flight, to live far from the dazzling splendor of the court, in tranquillity and honorable obscurity. She thanked the noble-hearted Moldask; but implored him, instead of such splendid offers, to preserve her secret inviolable, so that nothing might trouble her present felicity. He promised, and he kept his promise: his heart ardently desired her happiness, in which his own felicity was involved. Living under the same roof, in daily communion, their equal age and ardent feelings kindled in the young man's soul a livelier flame than mere friendship; but respect controlled it, and he concealed his love in his own bosom.

At length the old domestic, who, in the character of father, had shielded the princess, died, and was followed to the tomb by the sincere grief of his grateful mistress—a just recompense for such

* This extraordinary, but, we believe, true story, is translated from the *Novelle Morali* of Francesco Soave.

fidelity. Propriety forbade that Moldask and Carolina should inhabit together the same dwelling after this event. He loved her truly, but loved her good fame more, and explained to her, not without grief, that it was necessary he should seek another abode, unless she, who had already renounced all thought of pride and rank, were content to assume a name dearer and more sacred still than that of friend. He gave her no reason to doubt that vanity, instead of love, was the origin of this proposal, since the princess herself was firm in her desire to remain happy in private life. With all delicacy he sought to assure her that he could not but remember, in case of a refusal, that it was scarcely undeserved. Nor could he ever forget how much was exacted from him, by the almost regal birth of her to whose hand he thus dared aspire.

Love, and her desolate and defenceless condition, induced the princess willingly to consent; and, in constituting his felicity, she increased her own. Heaven blessed so happy a union; and in due time an infant bound still closer the marriage tie. Thus the Princess Carolina, born of noble blood, destined to enjoy grandeur, homage, even a throne, having abandoned the magnificence of her former state, in private life fulfilled all the duties of nature and of society.

Years passed happily on, until Moldask was attacked with disease, which required the aid of a skilful surgeon. Carolina was unwilling to confide a life so precious and beloved to the care of surgeons of doubtful skill, and therefore resolved to visit Paris. She persuaded her husband to sell all their possessions, and to embark. The winds were propitious to this pilgrimage; and the medical skill of Paris restored Moldask to health. Being now perfectly cured, the husband sought to obtain employment on the island of Bourbon; and was successful.

Meanwhile, the wife was one day walking with her graceful little girl in a public garden, as was her wont. She sat down on a green bank, and conversed with her child in German, when the Marshal of Saxony passing by, was struck with the German accent, and stayed to observe them. She recognized him immediately, and, fearing the same from him, bent her eyes to the ground. Her blushes and confusion convinced the marshal that he was not mistaken; and he cried out, "How, madame! What do I see! Is it possible?" Carolina suffered him not to proceed, but drawing him aside, she declared herself, praying him to keep sacred the needful secret, and to return with her to her dwelling, where she might with greater care and security explain her situation. The marshal was faithful to his promise; visited the princess many times, though with all due precaution, and heard and admired her history. He wished to inform the king of France, that this august lady might be restored to her rightful honors and rank, and that he himself might thus complete the good work begun by his mother the Countess of Konigsmark. But Carolina wished neither to consent, nor openly to oppose his generous design. She asked him to defer this project, until certain plans now pending were accomplished, the termination of which could not be long delayed. Thus she, too happy in being united to a wise and virtuous consort, and contented to live in happy obscurity, kept the marquis at bay.

Near the end of the specified time he again visited her, and learned that, two days previous, she had departed with her husband for the isle of

Bourbon. He quickly informed the king of all, who gave orders, through the governor of the island, that Moldask and his wife should be treated with the greatest consideration. Afterward he treated with the Empress Maria Theresa in what way her august aunt should be restored to the splendor due to her rank. The haughty wife, and mother of the czar, knew how to please the most Christian king, and not less generously sent letters to Carolina, in which she invited her to Vienna, promising to overwhelm her with distinctions. But Carolina, foreseeing that a return to her pristine rank at this regal court would debar her from fulfilling the sweet duties of wife and mother, in which all her felicity consisted, refused this offer courageously, but without haughtiness. "I am so used," she said to the officer who proposed to reconduct her to the court—"I am so used to this domestic and private life, that I will never change it. Neither to be near a throne, nor to receive the greatest homage, nor to enjoy riches, nor even to possess the universe, would give me the shadow of the pleasure and delight I feel at this moment." So saying, she tenderly embraced the one and the other of her dear family.

She lived long with her husband and daughter, serene and contented, dividing her cares and occupations between assisting and amusing the one, and educating the mind and heart of the other. Death snatched from her, within a short interval, these two beloved ones, who had filled her heart with such sweet emotions; and for a long time that heart was a prey to one only sentiment of the deepest grief. Yet not even this sorrow affected her so much, but that she believed the unhappiness of grandeur to be still greater. She constantly refused the repeated invitations to Vienna; and accepting only a small pension from the liberality of the empress, she retired to Vitry, near Paris, where she wished still to pass under the name of Madame Moldask; but it was impossible longer to conceal her high birth and illustrious ancestry. Notwithstanding this, she never abandoned her accustomed simplicity and retirement of life, in which alone she had begun to find, and found to the last, true felicity.

PEEL'S PATHETIC APPEAL TO DANIEL O'CONNELL.

I GIVE thee, Daniel, all I can,
 Though poor the offering be,
 The Maynooth Grant is all, my Dan,
 That I can yield to thee:
 I might give up the Irish Church,
 But if I did, what then?
 My friends would leave me in the lurch,
 I mean, my party men.

Perhaps 't is just, perhaps 't is fit
 That I should more concede;
 But then the House won't suffer it
 They won't, they won't indeed.
 Believe me, I my conscience pinch
 Much more than words can tell,
 To grant thee thus a single inch;
 And thou wouldst take an ell!

Oh! do be quiet, Daniel, pray,
 Be moderate, I implore;
 Take what I cede; another day
 I may allow thee more:
 Keep Ireland out of water hot,
 I beg thee, on my knees,
 And I won't say that she shall not
 Have justice—by degrees. *Punch.*

From Chambers' Journal.

HISTORY OF THE FIREPLACE.

DURING the last few years, public attention has been laudably directed to the defective means which still exist for warming and ventilating houses. Although we have arrived at a high state of civilization in some respects, yet the method still in use for producing an artificial climate in modern habitations, is perhaps more primitive and defective than any of our domestic contrivances. We burn coal in a vessel or stove which is no whit better in principle than the ancient fire-basket. Whilst the chimney-wall in each room is often heated like an oven, those opposite and at the sides are but a few degrees above the temperature of the atmosphere. In this respect the ancients evinced much greater ingenuity than we do; and many of the so-called inventions of modern date were, it appears, in general use hundreds and thousands of years ago. By the research of a recent author, many curious and interesting facts concerning warming and ventilation have been brought to light;* and as in this country all ideas of comfort and sociality are centred around the hearth, we doubt not that a historical sketch of the "fireplace," chiefly drawn from the above source, will prove interesting.

The history of the fireside may be said to commence in the dark ages; for it reaches back to a time when man was unacquainted with the existence of fire. The early records of nearly all nations refer to a time when that element was unknown. Indeed, instances of such ignorance have been met with in comparatively modern times. When Magellan visited the Marian Islands in 1521, the natives believed themselves to be the only people in the world. They were without everything which we regard as necessaries, and in total ignorance of fire. Several of their huts being consumed, they at first considered the flame to be a kind of animal that attached itself to the wood, and fed upon it. Some who approached too near, being scorched, communicated their terror to the rest, who durst only look upon it at a distance. They were afraid, they said, that the terrible animal would bite them, or wound them with its violent breathing. They speedily learned to use fire with as much address as Europeans. Few historical facts, therefore, are less doubtful than that man was once without means of artificial heat. A Phœnician tradition attributed its discovery to a hunter observing a conflagration that had been excited in a forest by the attrition of some trees during a storm. Another tradition varies the account; in the winter season, Vulcan the king, coming to a tree on the mountains that had been fired by a thunderbolt, was cheered by its heat; and adding more wood to preserve it, he invited his companions to share in his pleasure, and thereupon claimed to be the inventor of flame. Fire once discovered, the primeval savages, though at first alarmed, gradually felt its blessed influence; and it is thus that tradition gives us an account of the earliest fireside; for around the embers of the burning trees men first learned to herd; "and as the intercourse continued under the bond of the common enjoyment, the incoherent sounds by which they expressed their emotions were by degrees roughly cast into the elements of speech;

thus the discovery of fire gave rise to the first social meeting of mankind, to the formation of language, to their ultimate union, and to all the wonders of subsequent civilization."† The Chinese historians attribute the earliest power of producing fire at will, by the friction of two pieces of dried wood, to Souigine, one of their first kings. This power once known, the nomadic races in all countries ever availed themselves of it; though a fire made of dried wood or grass in the open air, or in a rude tent, was their sole provision against cold for many ages.

Increased intelligence induced mankind to seek for greater warmth under substantial cover, and the first houses they took to were ready built, being chiefly caves. In the middle of these they made fires, in spite of the smoke, for which there was no other outlet than the hole by which the inhabitants came in and out. The same rude method was continued even when men learnt to build houses, and to congregate in cities; only they made a hole in the roof to let the smoke out, exactly like the Laplanders and some of the Irish at the present day.

The parents of western civilization, the Egyptians, although they built themselves excellent houses, and were scrupulously nice in their domestic arrangements, either made their fires (for it is cold enough even in that warm climate to need them occasionally) on a central hearth, or used pans of live charcoal to carry about from one room to another. To them is ascribed the invention of bellows to concentrate the energy of fire. The reader will see in the second volume of Wilkinson's *Manners and Customs of the Ancient Egyptians*, copies of that instrument taken from paintings on tombs, at least three thousand years old. During the exode and wanderings of the Jews, their fireplaces were precisely like those both of the primitive races and of the modern Arabs—small bonfires in conical tents, with a hole in the apex of the cone to let out the smoke; but after their establishment in Canaan, their houses, it has been inferred, resembled those of the Egyptians, "wide, thorough aired with windows, and large chambers ceiled with cedar, and painted with vermilion;"‡ and, judging from the terms they had to mark the position, size, and manner of closing the apertures, they must have paid great attention to domestic accommodation. The winter in Palestine being cold and long, and wood abundant, particular apartments were appropriated to the season when fires were wanted, to avoid the nuisance of smoke pervading the house, and soiling its furniture and ornaments. About the latter end of November, King Jehoiakim was sitting in his "winter house," when he threw the roll of Baruch "into the fire that was burning on the hearth before him." The prophet Amos alluded to the same custom, when he declared that the "winter house, with the summer house," would be destroyed. From the hearths and braziers in these brumal apartments, the smoke was emitted at a hole in the roof, or by the *arubbah*; for, notwithstanding what some rabbis have written about the Jews being so scrupulous to preserve the purity of the Holy City, that they would not permit the erection of a chimney in Jerusalem, they were, perhaps, as ignorant as the Egyptians of that contrivance. The great improvement that

* On the History and Art of Warming and Ventilating Rooms and Buildings, &c. By Walter Berman, Civil Engineer. 2 vols. Bell: London.

† Vitruvius, b. ii., c. 1.

‡ Jerem. xxii. 14.

chimneys would have made on Mount Sion itself, is graphically described by Baruch, when he notices "the faces that were blacked by the smoke that cometh out of the temple."

The method of using fuel among the Greeks was the same as among the Hebrews, but perhaps without their care for ventilation. Homer describes his princes undressing themselves in the palace, to kill with their own hands the sheep, oxen, and swine they were to eat at dinner; roasting the entrails, and during the entertainment handing them to each other as delicacies. The repast being finished, he shows them sitting for their pleasure on the piled skins of the animals they had slain and devoured, and playing at games of chance, and one of them taking a pastern bone out of a basket in which it was lying, and throwing it at the head of a beggar, but on missing its aim, making a grease spot where it fell on the opposite wall. From this picture of the grossness of ancient manners, it may be concluded that when the poet says, Penelope's maids threw the glowing embers out of the braziers upon the floor, and heaped fresh wood upon them, he did not mean to depict his immortal barbarians burning odoriferous fuel on purpose to sweeten what must have been a vitiated atmosphere. The fire that was quickly to blaze on the hearth, had to diffuse the comforts of light as well as warmth; and the fragrant logs were known to abound with the resinous material of illumination. In the heroic age, they had oil and tallow in abundance, but were ignorant of the method of burning them in lamps; and the only use they appear to have made of wax, was to put it in the ear to shut out sound. Burning fuel was carried into the apartment where light was required, and sometimes placed on altars for the same purpose; and long thin pieces of lighted wood were carried in the hand when they moved from one place to another in the night.

Coal, it has been thought, was known to the Greek naturalists. Theophrastus speaks of fossil substances found in Liguria, and in Elis, in the way to Olympia, and used by smiths, that when broken for use are earthy, and that kindled and burned like wood-coal. The general fuel was green wood; and where that was unattainable, other vegetable and even excrementitious substances were used on the hearth for combustibles. On days of ceremony, it was also customary to burn fragrant substances. When Alexander the Great was at an entertainment, given in the winter by one of his friends, "a brazier was brought into the apartment to warm it. The day being cold, and the king observing the small quantity of fuel that had been provided, jeeringly desired his host," says Plutarch, "to bring more wood or incense." The supply of the precious firing appeared to the king too scanty for producing the required warmth; and if it arose from his host being niggardly of the costly fuel, he hinted that some even of the common sort would be acceptable.

The Romans made vast strides of improvement in fireplaces, although they were quite unable to rid themselves of the smoke nuisance. Vitruvius, in his work on architecture, directs that the walls of rooms "in which fires or many lights are burned, should be finished above the podium with polished panels of a black color, having red or yellow margins round them; and he advises that delicate ornaments should not be introduced into the cornices, because they are spoiled, not only by

the smoke of the house, but also by that from the neighboring buildings." The principal fireplace in a Roman house of the best kind was built in the bath, chiefly to heat the *caldarium* or sweating-room of a bath. It was a sort of furnace, and called a *hypocaust*, and served also to heat the walls of the whole habitation; quite upon the principle of the hot-air system which has recently been introduced as a modern invention. "The hypocaust being constructed in the under story of a building in the manner described by Vitruvius, several pipes of baked clay were then built into the walls, having their lower ends left open to the hypocaust. These pipes were carried to the height of the first or second story, and had their upper orifices made to open into the chamber that was to be heated. They were closed by movable covers. While green wood was burning in the furnace, and the hypocaust filled with its acrid smoke, the covers were not removed from the caliducts; but as soon as the wood was charred, the upper orifices of the pipes were opened, and the hot vapor from the hypocaust then flowed into the chamber." It is singular, that although these hot-air ducts would have answered to carry off smoke, the Romans never hit upon the expedient of applying them to that purpose.

The excavations of Pompeii have revealed to us the family hearths of the Romans, such as were used in rooms not sufficiently heated by the hypocaust. The general method of procuring a warm in-door climate, was by burning charcoal in a brazier on the pavement in the middle of the room, and allowing the vapor to exude at the door and window. These braziers and tripods, formed of all sizes, in iron and bronze, occasionally displayed great elegance of design and neatness of workmanship, and sometimes were contrived to heat water. One of this description, in the museum at Naples, is twenty-eight inches square, and has four towers, one at each angle, fitted with a lid that can be raised by a ring. The fire-hearth is placed in the square part in the middle, which is lined with iron, as in the common braziers. The fluid to be heated was contained in the towers. Another use of these cup-like towers reminds us once more that there is nothing new under the sun. When Dr. Arnott's stove was introduced, it was found to have an injuriously drying effect upon the air, consequently a vase of water was added, to supply the necessary humidity by evaporation. Now, what says Mr. Bernan on the use of these *foculari*? "The cold dry air of an Italian winter and spring was dedicated to a high degree after being expanded by the heat of a hypocaust, or a fire of charcoal; and these braziers appear a very elegant method of diffusing that quantity of moisture in the air of an apartment that was necessary to make it agreeable and salubrious. Perhaps the evaporation was partially regulated by shutting or opening the lids of the water vessels."

When the Romans landed in Britain, they found our savage forefathers living either in detached wigwams of wicker-work, in huts of loose stones, without chimney or window, or in excavated caves, like the Germans, surrounded by their winter provisions, and stifled with smoke. The following fireside picture is drawn from the Welsh historian Gyraldus:—"Families inhabit a large hut or house, which, having a fire in the midst, serves to warm them by day and to sleep round by night; and he describes the bands of young men who fol-

lowed no profession but arms, visiting families to whom they were always welcome, and passing the day with the most animated cheerfulness. At length, sunk into repose on a thin covering of dried reeds, spread round the great fire placed in the middle, they lay down promiscuously, covered only by a coarse-made cloth called *brychan*, and kept one another warm by lying close together; and when one side lost its genial heat, they turned about, and gave the chilly side to the fire. The great men endeavored to improve on this custom during the day. A Welsh prince had an officer in his court called a foot-bearer, whose duty it was, at meal-times, when his master was seated at table, to sit with his back to the fire, and keep the princely feet warm and comfortable by cherishing them in his bosom." In the later feudal times, the spacious lofty hall, left open to the roof, had its windows placed high from the floor, and filled with oiled linen or louver boards, or occasionally with painted glass. The floor of stone or earth had a part at one end raised a little above the general level, and laid with planks. On this platform or dais stood a massive table, and ponderous benches or forms, and a high-backed seat for the master under a canopy. On the hearth, in the middle of the hall, were placed the andirons for supporting the ends of the brands, that were arranged by means of a heavy two-pronged fork, the type and predecessor of the modern poker. On the roof over the hearth was a turret or louver, filled with boards arranged so as to exclude rain and wind, and permit the escape of smoke; and this was sometimes an object of considerable architectural beauty in the external aspect of the building. In this gaunt and aguish apartment, heated by a single fire, the company were in a position not much different from what they would be in the open air: not a particle of heated air could add to their comfort, for as fast as produced, it escaped through the louver: light was the only solace the greater number could derive from the blazing fuel; and the few who were in a situation to feel the radiant heat, were incommoded by the current of cold air sweeping like a hurricane along the floor towards the fire. From the height of the louver, and low temperature of the smoke, few of the buoyant flakes of charcoal found their way into the atmosphere; and the larger the bonfire the thicker was the layer of soot deposited on each individual. Boisterous weather also brought its annoyance. Had the fire been made in an open field, they might have moved to the windward of the smoke, but in the hall, where could they flee to from its miseries! The country houses of inferior landholders and farmers were generally one story high. If they were built with two stories, the roof was so deep as to reach to the ceiling of the lower room. The hall and kitchen forming one apartment, and roughly plastered, was open to the timbers of the roof, and sometimes had a louver, and a window that could be closed with a shutter:

"Barre we the gates,
Cheke we and cheyne we and eche chine stoppe,
That no light loopen yn at lover ne at loupe."

When these houses had a room to sleep in, old and young reposed in the same apartment, and several in one bed; servants made their beds on the floor in the kitchen.

* Ritson. *Metrical Romances*.

Cottages had neither louver nor loupe, and their inmates lay round the fire. Longlande describes one of a vagrant group:—

"Suten at even by the hote coles,
Unlouk his legges abrod other lygge at hus ees,
Rest hym and roste hym and his ryg turn,
Drynke drue and deepe, and draw hym than to bedde."

In lodging-houses, the same packing system was followed, and when a person had a bed to himself, it was a mark of distinction, and recorded accordingly. In the magnificent strongholds, built near the time of the conquest, a central hearth is seldom found. Having several stories in height, and their roofs being used as a terrace for defence, an exit in the common form for the smoke, even from the uppermost chambers, would have been impracticable. A huge recess, therefore, was built at one side of the hall, and on its hearth fuel was burnt, the smoke finding access by a contrivance which may be regarded as a chimney in its infancy. Over the hearth was a sort of huge funnel, or hole in the wall, which sloped up through its thickness, till it reached daylight in the outer side of the wall.

Wood, turf, and furze were almost the only fuel. The first legal mention of coal was made in 1239, when Henry III. granted a charter to the inhabitants of Newcastle to dig for it; but so great was the prejudice against it, from an erroneous notion that it was injurious to the health, that it was not in general use till the seventeenth century. Meanwhile, the funnel-like smoke-duct of the feudal castle became gradually improved into a chimney. Leland says in his *Itinerary*, speaking of Bolton Castle, "One thynges I muche notyd in the hawle of Bolton, how chimeneys were conveyed by tunnells made on the sydes of the walls betwyxt the lights in the hawle, and by this means, and by no covers, is the smoke of the hearthe in the hawle wonder *strangely* conveyed."

Chimneys were afterwards generally adopted. To old buildings they were added, whilst new ones were never constructed without what a wordy author calls "the elegant and commodious tube now known by the name of a chimney." By its help the fireside was greatly improved.

The following description applies to the firesides of the end of Henry VIII.'s reign, by which time chimneys or flues had become universal:—"The windows had curtains, and were glazed in the manner described by Erasmus; but in inferior dwellings, such as those of copyholders and the like, the light-holes were filled with linen, or with a shutter. The hearth-recess was generally wide, high, and deep, and had a large flue. The hearth, usually raised a few inches above the floor, had sometimes a halpas or dais made before it, as in the king's and queen's chambers in the Tower. Before the hearth-recess, or on the halpas, when there was one, a piece of green cloth or tapestry was spread, as a substitute for the rushes that covered the lower part of the floor. On this were placed a very high-backed chair or

* Though many authors antecedent to Leland use the term "chimney," yet they mean by that word simply "fireplace," or "hearth-recess;" and the verbal equivalent to the word in the Reformer's Testament is "furnace." Leland himself, in using the word, almost defines it by saying, "that the chimneys were conveyed by tunnells;" or, in other words, the fireplace was continued by a tunnel to the top of the building.

two, and footstools, that sometimes had cushions, and, above all, high-backed forms and screens—both most admirable inventions for neutralizing draughts of cold air in these dank and chilling apartments. Andirons, fire-forks, fire-pans, and tongs, were the implements to supply and arrange the fuel. Hearth-recesses with flues were common in the principal chambers of houses of persons of condition; and were superseding what Aubrey calls flues, like louver holes, in the habitations of all classes. The adage, that ‘one good fire heats the whole house,’ was found true only in the humbler dwellings; for in palace and mansion, though great fires blazed in the presence chamber, or hall, or parlor, the domestics were literally famishing with cold. This discomfort did not, however, proceed from selfish or stingy housekeeping, but rather from an affectation of hardihood, particularly among the lower classes, when effeminacy was reckoned a reproach. Besides, few could know what comfort really was; but those who did, valued it highly. Sanders relates that Henry VIII. gave the revenues of a convent, which he had confiscated, to a person who placed a chair for him commodiously before the fire, and out of all draughts.”

This description of an English fireside is accurate, even applied to a much later period—to indeed all the intervening space between the time of Queen Mary and that of William, Prince of Orange; for it was not till the latter reign that coal became the staple fuel. The prejudices against it, which we have before adverted to, was as strong as it was unaccountable. As an instance of it, we may mention, in passing, that when first introduced, the Commons petitioned the crown in 1306 to prohibit burning the “noxious” fuel. A “royal proclamation having failed to abate the growing nuisance, a commission was issued to ascertain who burned sea-coal within the city and in its neighborhood, and to punish them by fine for the first offence, and by demolition of their furnaces if they persisted in transgression; and more vigorous measures had to be resorted to. A law was passed making it a capital offence to burn sea-coal within the city of London, and only permitting it to be used in forges in the neighborhood. Among the records in the Tower, Mr. Astle found a document, importing that in the time of Edward I., a man had been tried, convicted, and executed, for the crime of burning sea-coal in London.” It took, then, three centuries to efface this prejudice; but when once coal was adopted, the whole aspect of the fireside was changed. For the capacious hearth, was substituted the narrower, less social, though compact and tidy one now in use. Chimney-pieces were introduced, at first elaborately carved in wood, and afterwards of marble. The fire—held in a grate or stove—was smaller and more concentrated to one part of the room. Despite the hosts of inventions which have for more than a century been in use to improve the grate, it still remains in principle and general utility the same as it did from the first day coal was generally burned. And despite the patents of Polignac, Bernhard, Evelyn, Rumford, for open grates, and those of Arnot and others for closed ones, our family circles still draw around a fireplace differing in no very essential particular from that which warmed our grandfathers and grandmothers. So little good have all modern contrivances really effected, that we of the present hour suffer the same inconveniences as the occupants of the Welsh fire-

side in the dark ages: when we remain near the fire, the part of our bodies nearest to it is liable to be roasted, whilst our back feels freezing, so that we are obliged, when “one side has lost its genial heat, to turn about and give the chilly side to the fire.” No invention has as yet enabled us to preserve a uniform and genial artificial climate in every part of our dwellings—an art in which even the Romans excelled us. Yet this is the age of ingenuity and luxury.

LITERATURE GOING TO THE WALL.—The following advertisement seems to open a new field to men of letters:—

INTELLECTUAL PAPER-HANGINGS, in which the writings of various authors are inserted in ornamental patterns, &c., &c.

There are many authors who will no doubt be very happy to treat with the trustees of public buildings, and we shall ourselves have much pleasure in supplying the walls of Westminster Hall, at per yard, according to quality. We have fitted up a few panes in our office-window with specimens, and a sheet of jocular paper-hanging may be seen in daily operation at 92 Fleet street.

We should say that various authors should be selected to do the mural literature for various apartments. George Jones, who must by this time be sadly in want of a job, would be invaluable as a writer for sleeping-rooms; and Jenkins, if he is to be found, could undertake to cover the walls of the servants’ hall with *belles-lettres* of the most appropriate character. The industrious author of “Jack Sheppard” might do the whole of the paper-hanging for Newgate; and some of our dramatists could furnish the walls of the condemned cell with productions of a genial nature. We are happy to see the paper-hangers coming forward in aid of the literature of the country, which has had no such friends since the old original trunk-maker, whose services to the cause of letters are recognized by Sir Gilbert Norman in Mr. Jerrold’s new comedy. Of the two, we prefer the celebrity of the walls to the semi-immortality of the portmanteau; for though the latter may last longest, the former is calculated to bestow a larger popularity. The literature of the trunk seldom meets the eye of any but the owner and the custom-house; while the author who

“Paints a panel or adorns a wall,”

is sure of his productions coming under the observation, at least, of all classes.—*Punch*.

It is but three or four weeks since that we gave an account of the extraordinary age of Mr. and Mrs. Plaisance, then living in Redmoor Fen, in the Isle of Ely, the husband of the age of 107, the wife 105!—a case without parallel perhaps in England or in the world. On Wednesday, strange to relate, after a short affliction, both expired on the same day; their united ages 212. The greater part of their lives were passed when agues were so prevalent in the Fens that very few escaped the disorder, yet their lives were prolonged to this extraordinary period; and Providence seems to have ordained that as they had lived so long together, in death they were not divided. They have left one daughter, who lived with them, of the age of 84.—*Bury Post*.

A PARENTAL ODE TO MY SON,
AGED THREE YEARS AND FIVE MONTHS.

Thou happy, happy elf!
(But stop—first let me kiss away that tear)
Thou tiny image of myself!
(My love, he 's poking peas into his ear)
Thou merry, laughing sprite!
With spirits feather light,
Untouched by sorrow, and unsoiled by sin,
(Good heavens! the child is swallowing a pin!)
Thou little tricky Puck!
With antic toys so funnily bestuck,
Light as the singing bird that wings the air,
(The door! the door! he'll tumble down the
stair!)
Thou darling of thy sire!
(Why, Jane, he'll set his pinafore afire!)
Thou imp of mirth and joy!
In love's dear chain so strong and bright a link,
Thou idol of thy parents (Drat the boy!
There goes my ink!)
Thou cherub—but of earth;
Fit playfellow for Fays by moonlight pale,
In harmless sport and mirth,
(That dog will bite him if he pulls its tail!)
Thou human humming-bee, extracting honey
From every blossom in the world that blows,
Singing in youth's Elysium ever sunny,
(Another tumble—that 's his precious nose!)
Thy father's pride and hope!
(He'll break the mirror with that skipping rope!)
With pure heart newly stamped from nature's
mint,
(Where did he learn that squint?)
Thou young domestic dove!
(He'll have that jug off with another shove!)
Dear nursling of the hymeneal nest!
(Are those torn clothes his best?) -
Little epitome of man!
(He'll climb upon the table, that 's his plan!)
Touched with the beautiful tints of dawning life,
(He 's got a knife!)
Thou enviable being!
No storms, no clouds, in thy blue sky foreseeing,
Play on, play on,
My elfin John!
Toss the light ball—bestride the stick,
(I knew so many cakes would make him sick!)
With fancies buoyant as the thistle-down,
Prompting the face grotesque, and antic brisk
With many a lamblike friak,
(He 's got the scissors, snipping at your gown),
Thou pretty opening rose!
(Go to your mother, child, and wipe your nose!)
Balmy, and breathing music like the south,
(He really brings my heart into my mouth!)
Fresh as the morn and brilliant as its star,
(I wish that window had an iron bar!)
Bold as the hawk, yet gentle as the dove,
(I'll tell you what, my love,
I cannot write unless he 's sent above!)
T. Hood.

We are saddened at the tidings of Mr. Hood's death. The following circular was about to be issued:—

"This distinguished writer—who has for upwards of twenty years entertained the public with a constant succession of comic and humoristic works, in the whole range of which not a single

line of immoral tendency, or calculated to pain an individual, can be pointed out; whose poems and serious writings rank among the noblest modern contributions to our national literature; and whose pen was ever the ready and efficient advocate of the unfortunate and the oppressed (as recently, for instance, in the admirable 'Song of the Shirt,' which gave so remarkable an impulse to the movement on behalf of the distressed needlewomen)—has left, by his death, a widow and two children in straightened and precarious circumstances, with no other means of subsistence than a small pension, terminable on the failure of the widow's life, barely sufficient to supply a family of three with common necessaries, and totally inadequate for the education and advancement of the orphan children. Even this scanty resource has been, of necessity, forestalled to a considerable extent during the last five months, in order to meet the heavy sick-room and funeral expenses. Under these circumstances a few noblemen and gentlemen, admirers of Thomas Hood's genius and humanity, have formed a committee for the purpose of raising a sum by subscription, to be held in trust for the benefit of the family during the widow's life, and at her death to be divided between the children, whom that event will leave destitute. Publicity is given to this design, in order that Thomas Hood's admirers throughout the country may have an opportunity of publicly testifying their recognition of his genius, and their sense of his personal worth." We heartily hope the design may prosper. Lords Northampton and Francis Egerton, and Sir E. Bulwer Lytton, are on the list of committee; and some handsome donations have already been made.

Will not some of the "merchant-princes" of Boston head an American movement to show gratitude and respect to an eminent FRIEND OF MAN?

A NEW article of import has been introduced by the Trent steamer, from the West Indies, in new potatoes; which have been successfully cultivated in the Bermudas, for the early supply of the English market, grown from the best seeds. The climate and soil is well suited for their growth, and about a ton has been brought over as a sample by the above steamer. In boiling, they are said to be even of superior quality to those of home produce, being less watery. The same vessel has also brought over a quantity of pine-apples, preserved in their juice in bottles, which are likely to be a very valuable addition to the kitchen.—*Morning Post.*

A LUSUS NATURÆ.—The Court Newsman tells us that the queen and Prince Albert postponed their visit to Claremont on account of the royal children having been "unexpectedly attacked by the hooping-cough." The Court Newsman being a perfect courtier, has, of course, no right to expect that anything so common as the hooping-cough should approach the royal infants. Our contemporary appears to be utterly taken aback at the idea of the vulgar hooping-cough having made its appearance in the nursery at Buckingham palace. How it got there is a marvel to the Court Newsman, who uses the word "unexpectedly" to mark his sense of the impertinent intrusion which the malady has been guilty of.—*Punch.*

MRS. CAUDLE HAS BEEN TO SEE HER DEAR MOTHER. CAUDLE, ON THE "JOYFUL OCCASION," HAS GIVEN A PARTY, AND ISSUED THE CARD OF INVITATION.

It is hard, I think, Mr. Caudle, that I can't leave home for a day or two, but the house must be turned into a tavern: a tavern!—a pothouse! Yes, I thought you were very anxious that I should go; I thought you wanted to get rid of me for something, or you would not have insisted on my staying at dear mother's all night. You were afraid I should get cold coming home, were you? Oh yes, you can be very tender, you can, Mr. Caudle, when it suits your own purpose. Yes, and the world thinks what a good husband you are! I only wish the world knew you as well as I do, that's all; but it shall, some day, I'm determined.

"I'm sure the house will not be sweet for a month. All the curtains are poisoned with smoke; and, what's more, with the filthiest smoke I ever knew. *Take 'em down then?* Yes, it's all very well for you to say, take 'em down; but they were only cleaned and put up a month ago; but a careful wife's lost upon you, Mr. Caudle. You ought to have married somebody who'd have let your house go to wreck and ruin, as I will for the future. People who don't care for their families are better thought of than those who do; I've long found out *that*."

"And what a condition the carpet's in! They've taken five pounds out of it, if a farthing, with their filthy boots, and I don't know what besides. And then the smoke in the hearth-rug, and a large cinder-hole burnt in it! I never saw such a house in *my* life! If you wanted to have a few friends, why could n't you invite 'em when your wife's at home, like any other man! not have 'em sneaking in, like a set of housebreakers, directly a woman turns her back. They must be pretty gentlemen, they must; mean fellows that are afraid to face a woman! Ha! and you all call yourselves the lords of the creation! I should only like to see what would become of the creation, if you were left to yourselves! A pretty pickle creation would be in very soon!

"You must all have been in a nice condition! What do you say! *You took nothing!* Took nothing, did n't you? I'm sure there's such a regiment of empty bottles, I haven't had a heart to count 'em. And punch, too! you must have punch! There's a hundred half-lemons in the kitchen, if there's one: for Susan, like a good girl, kept 'em to show 'em me. No, sir; Susan *shan't* leave the house! What do you say! *She has no right to tell tales, and you will be master in your own house!* Will you? If you don't alter, Mr. Caudle, you'll soon have no house to be master of. A whole loaf of sugar did I leave in the cupboard, and now there is n't as much as would fill a tea-cup. Do you suppose I'm to find sugar for punch for fifty men! What do you say! *There was n't fifty!* That's no matter; the more shame for 'em, sir. I'm sure they drank enough for fifty. Do you suppose I'm to find sugar for punch for all the world out of my house-keeping money! *You don't ask me!* Don't you ask me! You do; you know you do: for if I only want a shilling extra, the house is in a blaze. And yet a whole loaf of sugar can you throw away upon—No, I *won't* be still; and I *won't* let you go to sleep. If you'd got to bed at a proper hour last night, you would n't have been so sleepy now.

You can sit up half the night with a pack of people who don't care for you, and your poor wife can't get in a word!

"And there's that China image that I had when I was married—I would n't have taken any sum of money for it, and you know it—and how do I find it! With its precious head knocked off! And what was more mean, more contemptible than all besides, it was put on again, as if nothing had happened. *You knew nothing about it?* Now, how can you lie there, in your Christian bed, Caudle, and say that? You know that that fellow, Prettyman, knocked off the head with the poker! You know that he did. And you had n't the feeling—yes, I will say it—you had n't the feeling to protect what you knew was precious to me. Oh no, if the truth was known, you were very glad to see it broken for that very reason.

"Every way, I've been insulted. I should like to know who it was who corked whiskers on my dear aunt's picture! Oh! you're laughing, are you? *You're not laughing!* Don't tell me that. I should like to know what shakes the bed, then, if you're not laughing! Yes, corked whiskers on her dear face—and she was a good soul to you, Caudle, and you ought to be ashamed of yourself to see her ill-used. Oh, you may laugh! It's very easy to laugh! I only wish you'd a little feeling, like other people, that's all.

"Then there's my china mug—the mug I had before I was married—when I was a happy creature. I should like to know who knocked the spout off that mug! Don't tell me it was cracked before—it's no such thing, Caudle; there was n't a flaw in it—and now I could have cried when I saw it. Don't tell me it was n't worth twopeace. How do you know! You never buy mugs. But that's like men; they think nothing in a house costs anything.

"There's four glasses broke, and nine cracked. At least, that's all I've found out at present; but I dare say I shall discover a dozen to-morrow.

"And I should like to know where the cottage umbrella's gone to—and I should like to know who broke the bell-pull—and perhaps you don't know there's a leg off a chair—and perhaps—"

"Here," says Caudle, "Morpheus came to my aid, and I slept; nay, I think I snored."—*Punch*.

From the *Examiner*.

THE PORTENDICK BLOCKADE.

THIS is one of the many questions in foreign policy of the true merits of which the public are not in the least aware, and yet on several occasions within the last few years, when the subject has been brought before parliament, noble lords and honorable members have expressed themselves in terms of strong indignation against the supposed violence and injustice of France, and of sympathy with the *unfortunate sufferers* in the city, who have assumed the character of victims of French audacity and oppression. We entertained long ago a strong suspicion that the claims put forward in this matter by the merchants to the extent of 75,000*l.* were enormously exaggerated, and the result has fully justified that suspicion, for, according to the award of the king of Prussia, the entire indemnity allotted to the claimants has been fixed at about 1,700*l.*

We take for granted, that when the British

government submitted this matter to the arbitration of the King of Prussia, the whole of the claims were fairly laid before his majesty, and that no material feature in the case was withheld from his notice. This being so, the award appears to us a cutting reflection upon the absurd pretensions of these merchants, which have been so largely curtailed by the Prussian award. It is, however, a gratifying circumstance, that the case has been so disposed of as to prevent the rupture (at one time seriously threatened) of our pacific relations with France, and also to preclude the possibility of any just demand being made upon parliament by parties whose claims have already been thoroughly sifted and adjusted at Berlin.

There has, however been a dispute between the *Times* and *Chronicle* upon the question whether the agreement between England and France, referring the matter to Prussia, was defective by excluding from the consideration of the arbitrator the question of the legality of the blockade. The *Chronicle* maintains that the claims were referred to Prussia with the reservation that those claims, which turned upon the legality of the blockade, being the greater part of the whole, should not be adjudicated upon;—*ergo*, they have not been determined—M. Guizot has juggled Lord Aberdeen—the victims must be indemnified by the nation—and John Bull must pay the piper. We agree with the *Times* in pronouncing the existence of such a juggle to be wholly incredible. The fact appears to have been simply this—all the claims, and all circumstances and questions connected therewith, were referred to the royal arbitrator, and among those circumstances the validity of the blockade was one which was forced upon him to consider and determine. But the agreement of reference contained a clause stipulating that the general belligerent right to blockade the Bay of Portendick in time of war—claimed by France and disputed by England—should not be affected by the award;—that is, that the award should not be a precedent, whichever way it might decide. Nothing, then, can be clearer than that the Prussian award has disposed of the question of the blockade, in so far as it affected the claims of these merchants, but that the general international question between England and France, of the right of the latter to blockade Portendick in time of war, remains exactly where it did before the arbitration.

So far as we can make out the merits of this latter question, (which has been fully stated by the *Times'* correspondent *Mercator*.) we are clearly of opinion that France possesses, and always did possess, the right to blockade any part of the coast of Africa in the occupation, either permanent or temporary, of her enemies with whom she is at war. The King of the French was at war with the king of the Trarzas (for the Trarzas are a nation having a monarchical government,) and in order to cut off the supplies of the Trarzas through Portendick, the French blockaded the coast within certain limits. Upon what grounds a British minister disputed so legitimate a proceeding we are at a loss to discover. Certainly there are many cases in which a British squadron has established and maintained blockades, both in Africa and other parts of the world, under circumstances not more justifiable. There was, indeed, a clause in an old treaty, which concedes to the English the right of carrying on the gum trade between Portendick and the River St. John, but that right became, of course, suspended when the French

were *bona fide* at war, and found it necessary to establish a blockade for belligerent purposes.

We rather think, then, that the king of Prussia's award in this dispute will teach our government some useful lessons, and among them that of using more caution and circumspection before espousing these alleged mercantile grievances, and attempting to force them for compensation upon foreign powers. So far from our having sustained any considerable injury from the French, the truth is that France has no small reason to complain of us, for having presented her with a demand to the amount of 75,000*l.*, when, in fairness, we were only entitled to 1,700*l.* Our executive, of course, owes deference to the opinion of parliament; but we trust parliament will never be deficient in the respect due to the rules of international law, nor will ever be so far misled by the clamor of interested parties as to sacrifice to it one jot of strict justice, or one opportunity for the conservation of peace.

ARBITERS IN DISPUTES BETWEEN NATIONS.

PROJECTS for the establishment of a great European Council to exercise jurisdiction in national controversies, and thus prevent wars, are as old as the age of Henri Quatre. The increased frequency in modern times of the practice of referring disputes between two governments to the decision of a third independent government has been hailed by philanthropists as preparing the minds of men for the establishment of such a council. When arbitration, it has been said, becomes the rule and war the exception—when a number of arbitral decisions sufficiently large to form a body of precedents has accumulated—a fixed code of international law may be said to have been formed, and governments will hesitate less to recognize a court authorized to apply its rules to special cases than they do at present when all is vague and unsettled.

The experience of England, however, has not hitherto been of a kind to inspire us with confidence in the judgments of arbiters. Take for example the recent decision of the King of Prussia in the Portendick controversy between this country and France. The only question between the two countries was, whether in inflicting injury upon British traders France was acting on its right. Respecting the amount of injury received there has been ultimately no dispute. France maintained that the injury complained of was unavoidably inflicted in the process of enforcing a legal blockade. The French minister admits that the intended blockade was never intimated to the British government. There was no legal blockade. Yet the King of Prussia, for what reason is not stated, pares down the restitution to be made to a miserable fraction of the property actually abstracted or destroyed.

Again: when the controversy between Great Britain and the United States respecting the southeastern boundary of Canada was referred to the arbitration of the King of Holland, an award was made, which, though it did not give us all we claimed, could not exactly be called an adverse decision. But from this award we derived no benefit. A pettifogging technical plea, as to the competency to pronounce such a judgment under the terms of the reference, was raised by the United States government, and negotiations began anew.

This country, at least, seems to have no chance of justice under the arbitration system. Either it is denied us by the arbiters themselves in consequence of some inexplicable refinement of reasoning, or it is evaded by our co-referees on some technical quibble. A nation ought to sacrifice much to avoid war, but there are limits to the application of this principle. A nation is not bound—is not entitled—to submit to a series of unjust decisions or evasions. Acquiescence may invite arbiters to decide against the party which has always shown itself most yielding; and many small robberies may make up a large sum, besides encouraging to more wholesale plunder. England has sacrificed enough already to give the arbitration experiment a fair trial. It is proposed that the Oregon controversy should also be referred to arbiters: with the recent experience of the Canadian boundary and Portendick controversies, England had better keep the maintenance of her rights in Oregon in her own hands for the present.—*Spectator*.

THE MIRROR OF THE DANUBE.

BY FRANCES BROWN.

On forests bright with fading leaves,
On hills of misty blue,
And on the gathered gold of sheaves
That by the Danube grew,
The setting sun of autumn shed
A mellow radiance rich and red,
As ever dyed the storied flood,
Since Roman blent with Dacian blood.
But Rome and Dacia both were gone,
Yet the old river still rolled on;
And now upon its sands, apart,
A peasant mother stood,
With beaming eye and bounding heart,
Marking the fearless mood
Of her young children's mirth that rang
Where late the joyous reaper sang.
She blessed each yet unsaddened voice,
Each head of golden hair,
Her rosy girl, her blooming boys,
And their young sire: for there
Was gathered all that meek heart's store:
The earth for her contained no more.
Yet with the love of that long gaze,
Were blent far dreams of future days;
And oh to learn what time's swift wing
To her life's blossoms yet might bring.
Then came a sound like passing wind
O'er the old river's breast,
And that young mother turned to find,
Upon the wave impressed,
The mirrored semblance of a scene
That never on its banks had been.
It seemed a pillared fane that rose
For justice far away,
In some old city at the close
Of a long trial day;
When hope and doubt alike were past,
And bright the midnight torches cast
Their splendor on a breathless crowd,
Dense as the summer's thunder cloud;
Ere the first lightning breaks its gloom,
Waiting the words of death and doom.
But far amid that living sea
Of faces dark and strange,

One visage claimed her memory;

In spite of time and change,
And all that fortune's hand had done,
The mother knew her first-born son.
Sternly he sat in judgment there;
But who were they that stood
Before him at that fatal bar!

Was he—the unsubdued
In heart and eye, though more than age
Had written on his brow's broad page
The fiery thoughts of restless years,
Whose griefs had never fallen in tears;
Unblanched by guilt, untouched by scorn,
Her beautiful, her youngest born,
And he upon whose hair and heart

Alike had fallen the snows
Of winters that no more depart;

The worn of many woes
And hopeless years—was he in truth
The loved, the chosen of her youth?
She knew not what of woe and crime

Had seared each form and soul,
Nor how the tides of fate and time
Had borne them to that goal;

So much unlike that peaceful scene
Of stream, and corn, and sunset sheen:
And they, oh how unlike to those
Whose fearless joy around her rose!
And yet through sorrow, guilt, and shame,
She knew they were the very same.

Their judge, perchance, he knew them not;
For o'er his brow there passed
No troubled shade of haunting thought

From childhood's roof-tree cast;
Save that his glance, so coldly bright,
Fell with a strange unquiet light
Upon a face that still was fair,
Though early worn and wan.

Yet lines of loftier thought were there;

The spirit's wealth, that ran
To waste, for sin bore darkly down
What might have worn an angel's crown.
And o'er that mother's eye, which yet
Beheld, and wept not till it met
The gaze of her lost girl, there came
A sudden gush of sorrow's stream,
As though the drop that overflowed
Its urn had fallen there.

But when it passed that darkening cloud,
And she looked forth again
On the old river, vanished all
Were city, crowd, and judgment-hall.
The autumn night, with sudden gloom,

Came down on sea and shore,
And silently her cottage home

She sought; but never more
Gazed on the Danube's slumbering wave,
Nor wept above an early grave;
Or cast one look of pride and joy
On rosy girl or blooming boy;
And even from their haunts of play
Her glance was sadly turned away;
But deep in dreamless slumber sealed
Her eyes from all the tears

Whose coming that bright eve revealed.

And all the after years
Kept the dark promise of that hour.
And had the earth's old rivers power
To mirror the far clouds that lie
So darkly in life's distant sky,
How many a loving heart would turn,
Like hers, for comfort to the urn.

From *Alasworth's Magazine*.

A BIT OF "STILL LIFE" AMONG THE HILLS OF CONNEMARA.

ON a fine bright August morning, some ten years since, with my trusty Manton in my hand, and accompanied by a favorite setter, I strolled up the mountain, which overhung a friend's shooting-lodge in Connemara. For some time, I was tolerably successful in my sport; bird after bird sprang up from the heather, only to find its way into my capacious pockets; and by twelve o'clock I found I had secured more game than I could well stow away. Cursing my want of forethought, which had prevented me from accepting the services of at least one of the dozen lazy hangers-on at the lodge, I determined on retracing my footsteps, with what feelings I leave it to my brother sportsmen to decide.

Fortune, however, had better luck in store for me. I had not moved ten yards from the spot where I had been standing, when a thin blue wreath of smoke, curling over the shoulder of a mountain far away to the right, attracted my attention. Certain, now, of discovering some house where I might deposit my spoil, and obtain shelter from the heat which was becoming intense, I drew my shot-belt tighter around me, and, shouldering my gun, pushed briskly forward—now plunging to the hips in the tall heather, now threading my way through a morass—till, after half-an-hour's hard work, I reached a small low cabin at the top of a narrow glen, and out of the chimney of which the smoke was pouring in considerable volumes.

I had been long enough in Connemara to more than half suspect I had come unawares on an illicit still; indeed, the day before, I had heard there was one in full operation somewhere in these mountains, so, without farther ceremony than the usual Irish benediction of "God save all here," (to which the over-scrupulous add, "except the cat,") I pushed open the door and entered the cabin.

A tall, fine-looking girl, whom I immediately recognized as an old acquaintance, having frequently seen her at the lodge, was seated on a low stool in the centre of the apartment, while a stout, middle-aged countryman, dressed in a long frieze coat and knee breeches, but without shoes or stockings, was on his knees in a corner blowing away with a pair of old bellows at a turf fire, on which hung what appeared to my uninitiated eyes an immense pot. My sudden entrance evidently startled him not a little, for, springing to his feet, he grasped a stout blackthorn stick that lay beside him, and stared at me for a moment with a countenance in which fear and rage were curiously blended. Not so the girl. She rose from her seat and welcomed me to the cabin, with that gay, frank, and peculiarly Irish hospitality, which, I'll be sworn, has gladdened the heart of many a weary sportsman like myself.

"A, thin, bud yer honor's welcome. It's happy and proud we are to see you. Tim, you unmannerly thief, what are you starin' for, as if ye seen the gauger! Don't ye see the master's frind standin' foreninst you! and yer caubeen on your head, ye amathaun!"

Tim doffed his hat with much reverence. He "axed my honor's pardon; but the thieven gaugers war gettin' so plenty, that a poor boy could

hardly get done a hand's turn without havin' them on his tracks."

I looked at the fellow as he spoke. There was none of that brutal, debauched look about him which distinguishes the English law-breaker. On the contrary, he was a very fair specimen of an Irish peasant; and, as I examined his honest, manly countenance, I could not help feeling strong misgivings as to the righteousness of the excise laws. Whether this feeling was caused by the delicious smell of the "potheen" that pervaded the room, I leave it to the charitably disposed reader to decide.

Meantime, a bottle filled with the aforesaid potheen was placed on the table by the girl, and consigning my Manton to a corner, and emptying my pockets on the dresser, I speedily came to the conclusion that there are worse places than an Irish still-house for a tired sportsman to rest in.

I had hardly drained the first glass to the health of my fair hostess, when a little ragged, sunburnt gossoon rushed into the cabin, and, clasping his hands above his head, broke out into the most unearthly yell I ever heard.

"Och! wirr-as-thru, murder!—och hone! och hone! Save yourselves for the sake of the blessed Vargin! We're sowld!—the peelers is an us!"

Tim jumped from his seat as he spoke, and, seizing him by the collar, shook him violently,— "Who! what!—How many is in it! Spake, you young reprobate, or, by Jabers, I'll make short work of you!"

"There's two!—bad luck to them!" sobbed out the poor boy. "They kem round the priest's pass, and were an me afore I could bless myself."

"Then the devil resave the drop of sparits they'll seize there to-day!" said Tim, as his eye fell on my double-barrel that was leaning against the wall beside me.

"Come, my fine fellow," I cried, "that won't do. I'll do what I can for you. But you had better not try that."

We had no time for farther parley, for the next moment the heavy tramp of footsteps was heard without, and two revenue policemen, with fixed bayonets, entered the cabin.

"A purty mornin's work you have made of it, Mистер Connolly," said the foremost of the pair, "but a mighty expensive one, I'm thinkin'. Long threatenin' comes at last. I towld you I'd be on your thrack afore long, and I've kept my word. Guard the door, Jim, and let no one pass out."

"An' I towld you," said Tim, his face darkening as he spoke—"I towld you I'd be even wid you for what ye did to poor Hugh Connor. So pass on your way, and lave me and mine alone, or it'll be the worst job ever you put a hand in."

"I must first see what you have on the fire, my good lad," said the man: "so make way there, in the queen's name."

"It ill becomes the like of ye to have the queen's name in yer mouth, ye dirty informer," said Tim. "So pass on yer way—I say again—or the devil a bit of this world's bread ever you'll eat."

"We'll try that presently," said the policeman, coolly: "Jim, keep an eye on the girl that she does n't bolt on ye—she's as cunnin' as a fox."

So saying, and lowering his carbine, he attempted to pass Tim, but, in doing so, he evidently reckoned without his host, for, with a shout like a Delaware Indian, Tim sprang within his guard and seizing him by the collar, in a second both men were rolling over on the ground, grappling one another like two bulldogs.

My hostess, like myself, had hitherto remained an inactive spectator; but she now evidently determined not to let them have all the fun to themselves, for, taking up a pair of heavy iron tongs, she would soon, no doubt, have made a considerable diversion in Tim's favor, had not the other policeman jumped forward and caught her by the wrist.

"So that 's yer game, is it, my lady! then I'll take the liberty of fittin' you wid a pair of bracelets," producing at the same time a pair of handcuffs which he attempted to force on her wrists; but the girl struggled desperately, and, in doing so, must have irritated him greatly, for the ruffian struck her a heavy blow with his closed fist.

My blood was now fairly up, and grasping my gun I inserted the butt-end under the fellow's ribs, and dashed him into the corner; where, his head striking heavily against the sharp edge of a table, he lay apparently insensible.

"Run for it, Master Harry—never mind Tim—run or you'll be cotched!" shouted Mary, as she vanished out of the back door, while I bolted at the front. The ringing sound of a stick against the policeman's shako, telling me, as I went, that Tim's blackthorn was doing its office.

I had got about fifty yards up the mountain, when I turned and witnessed a sight I shall not easily forget. I have mentioned before that the cabin was built at the top of a glen, between two mountains. Down this glen bounded Tim with the speed of a hunted stag, his long frieze coat streaming in the wind behind him, while the worm (the only valuable part of the apparatus) was bobbing up and down over his shoulder, keeping time to the motion of his bare legs, which were taking the ground along with them at an awful pace. In front of the cabin was his antagonist ramming a cartridge down his carbine, with unmistakable energy, which the moment he had accomplished he fired slap after the caubeen, but the ball only tore up the ground some yards to his right, and with a yell of triumph I saw Tim disappear round the corner of the glen.

It was late in the evening when, tired and travel-stained, I entered the dining-room at the lodge, where I found a large party assembled.

"Harry, my boy," said my friend, "we had given you up in despair. Ellen insisted you had fallen over a precipice, or were drowned in a bog-hole, or something of the kind. You look tired, too," filling me a tumbler of claret as he spoke; "there, now, take off that."

I never was remarkable for setting the table in a roar; but, on this occasion, if Theodore Hook himself had been relating my adventure I doubt whether he could have succeeded better than I did myself, and the old oak ceiling rang again, as my friend starting up and pointing to a short, punchy, red-faced, little man, said:—

"Let me introduce you to Lieutenant Cassidy, late of H. M.'s 88th regiment, and now commander of the Clifden revenue police."

"And an officer," said the lieutenant, bowing,

"who would be sorry to interfere with any gentleman's diversions, even if he chose to break the heads of every scoundrel in the squad. The only thing I would recommend," he added, lowering his voice as he spoke, "is change of air; after your praiseworthy exertions this morning, I am sure it would be of service."

From Ainsworth's Magazine.

THE VICTIMS OF DIPLOMACY.

We take credit to ourselves for having already grappled with this subject, which is daily assuming a more important aspect. We gave to it originally, the title now adopted by Captain Grover; but, if his views are correct, the phrase to be used should rather be the "victims to diplomacy," as expressive of a new order of political atomements, offered up in the persons of ambassadors and envoys to political expediency. This is a kind of political drama, which can only be well enacted in semi-barbarous countries; and it is therefore, as yet, confined to Anglo-Russian rivalry. For a time it concerned itself more with the loss of political and commercial advantages, as the resignation of the Euphrates and the Tigris, the retreat from Afghanistan, and many minor cessions made to Russian influence; but Russia began with disavowing agents, in the person of the unfortunate Vicovitch, and Great Britain carried out the principle wholesale, in the almost simultaneous sacrifice of Wyburd, Stoddart, and Conolly. There is no mincing the matter now; all the points are ascertained, all the details established beyond controversy; and it will never do to allow a transaction, involving the utmost disgrace and the most humiliating dishonor to the nation, to pass by unnoticed.

Notwithstanding the disavowal of government, the fact of these gentlemen being politically employed, is now placed beyond question. Lieut. Wyburd was sent, in 1835, by Sir John Campbell, who then represented the sovereign of Great Britain at the court of Persia, on a very important secret mission to Khiva. He has never been heard of since; and apparently, indeed, scarcely inquired after. Dr. Wolff's mission to Bokhara suggested the opportunity of making such inquiries; and Captain Grover, as president of the committee, addressed a letter to the foreign office, calling attention to the case. The answer was, that the foreign office "was not aware that Lieut. Wyburd was sent on any mission at all to Khiva." This Gothic expression "at all" betrays considerable irritability upon the subject. The dauntless Grover immediately responded, that he had Sir John Campbell's authority to the effect that he was employed. The foreign office was obliged to cry "peccavi," and acknowledge that it had overlooked the possession of a dispatch to that effect; sheltering itself also under the statement, that the British embassy at the court of Persia was at the time of Lieutenant Wyburd's mission under the direction of the East India Company, and not of the foreign office. It would scarcely be conceived, that in consequence of this, not only is an envoy overlooked and lost sight of, but being denied and repudiated by the foreign office, and dead to the East India Company, a pension to Lieutenant Wyburd's aged and unfortunate mother is refused, by the latter, because, although an officer in their service, he was sent on this mission, not by the company, but by Queen Victoria's government.

Well may Captain Grover, in his letter to the Earl of Aberdeen, of May 2nd, 1844, say—

“Should the notion get abroad that British officers are to be sent on perilous duties, to be then abandoned, the honor of the British army, and the prosperity of the British nation, will soon be among the things past.”

The same year that poor Wyburd was sent off, never to be again made mention of, till some generous, humane and gallant Grover asks the whereabouts of his official grave, Colonel Stoddart was attached, as military secretary, to Mr. Ellis' mission to Persia. Three years afterwards, in 1838, Russia sent a large and rich caravan to the frontiers of Bokhara, the pretended peaceable merchants of which were in reality agents and officers of the government. It was expected that so rich a prey would tempt the nomades of the Oxus; and, to reclaim its subjects, Russia intended an invasion of Central Asia. The thing happened as anticipated: the caravan was beset, and the sham merchants converted into willing prisoners. This was at the time when the expedition into Afghanistan was preparing. The Czar was also assembling troops for the Oxus. In order to prevent this, Lord Palmerston despatched orders to send some clever and intrepid member of the Persian mission into Bokhara, to prevail upon the Amir to restore the supposed merchant prisoners, and thus to deprive Russia of a pretence for war. Colonel Stoddart was selected for this purpose.

“It is impossible,” says the *Revue de Paris*, in noticing this mission, “not to envy England these courageous agents, which it always finds ready to devote themselves to its service. The merit is so much the greater, as the fate that awaits them in these perilous enterprises is scarcely ever doubtful. For one Burnes, whose name becomes known throughout the civilized world, how many victims of this patriotism fall obscurely, disappear without leaving any more traces than the straw which is carried away by the wind! These examples of devotedness are sublime; they deserve to be held out to the just admiration of people.”

Success attended upon the mission. The Russian prisoners were liberated, and the Czar deprived for a time of an excuse for the conquest of Bokhara. But the Amir, frightened by the progress of the British in Afghanistan, determined upon detaining Colonel Stoddart, in order that if his own territories or surety should be affected by the war, he should be enabled to negotiate with better chance of success. This is now the opinion of all best able to judge of Oriental actions. It was the explanation given by the Khan of Khiva to Captain Abbot; it is the explanation admitted by Captain Grover, and by the *Revue de Paris*. But the Amir was also irritated that the envoy, in whose detention he had placed his hopes of safety, could not obtain from a timid or forgetful government the proper vouchers for his authority; and he added cruel tortures to what was at first a mere captivity. On a former occasion, we surmised the possibility of the British envoy having been confined in the horrid well full of ticks. Captain Grover now makes the positive circumstance of that confinement known to the public.

The detention of Colonel Stoddart betrayed the secret of the embassy to the Russians. It was to be expected that the czar would be irritated at having been outwitted in the caravan plan; and it appears to have caused less compunction at the

foreign office to disavow and abandon an agent full of integrity and honor, and a gallant officer, than to be obliged to wince under the imperial frown. It is not that such a disavowal of an agent would satisfy Count Woronzow or his imperial master of the innocence of Great Britain in having thwarted their measures in Central Asia, but it is that the humiliation of such a proceeding is considered, in the Anglo-Russian international diplomacy, as an equivalent for the success temporarily obtained through the means of the now repudiated envoy.

The arrival of Conolly gave greater complication to the affair. This officer—according to Sir Robert Peel's statement, made in the House of Commons on the 28th of June, 1844, in answer to a question by Mr. Cochrane—had been sent by the Indian government to make communications at Khiva and Cokan. An intimation was made to Colonel Stoddart that Captain Conolly was at Khiva, and if he thought he could be useful to him, he had authority to send for him from that place. Colonel Stoddart, guided by these direct official instructions, wrote to Captain Conolly, who in consequence repaired to Bokhara. On the same occasion Sir Robert Peel stated before the House that Colonel Stoddart had been authorized to repair to Bokhara, and was directly employed by the government to make communications at Bokhara; putting that part of the question which refers to the disavowal of both these envoys beyond a doubt. And yet these were the two officers, employed on so perilous a mission, and as deeply engaged in the service of their queen and their country as the foreign secretary and the governor-general themselves, whom Lord Ellenborough wrote to the Amir, claiming as “innocent travellers”—that is, declaring them to be impostors and spies. “A mode of intervention,” says the *Revue de Paris*, “which succeeded in destroying them.”

But as the detention of the British emissaries was persevered in by the Amir, in order to ensure safety to his own territories, he could have nothing to gain by their death. He might subject them to cruel tortures, when disavowed by their government, but it could never have been his interest to actually destroy them. With the capriciousness of an Oriental despot they might be tortured to change their faith, and then liberated to practise openly the rites of the Christian religion: they might be one day in a dungeon, and another in favor at court; but unless disease and suffering may have carried them off, there is no reason to believe that the Amir would cause them to be slain. When Captain Grover was at St. Petersburg, he heard that the prisoners had been removed to Samarcand before Dr. Wolf arrived at Bokhara; and the circumstances attendant upon the interview of that excellent man with the Shakh-haul (secretary of state for foreign affairs) are highly corroborative of this opinion.

It makes the blood run cold to read the following. Dr. Wolf writes—

“The time of evening approached, and the military band played ‘God save the Queen,’ which most agreeably surprised me.”

Dr. Wolf makes no observation whatever upon this very extraordinary circumstance.

“At Bokhara,” says Captain Grover, “they have not the least idea of music, according to our acceptance of that term;” and Dr. Wolf says, “there was not a man at Bokhara who knew any-

thing of England or the English language, except the Nayib's 'halt-front,' and 'no force.' What then means this 'God save the Queen,' played passing the doctor's residence, or I should say prison?

"I will give the reader my opinion, upon which he will place his own value.

"During the Cabul disaster numerous British soldiers and sepoy were taken prisoners, and I have good reason to believe were sold at Bokhara. One of the chief objects of Dr. Wolff's mission was to purchase the release of these unfortunates, and he had authority to draw upon my small fortune for that purpose. Among these prisoners would probably be found some musicians, and the king would most likely form these men into a band. The king of Bokhara would of course be most anxious to conceal from Dr. Wolff the presence of these men at Bokhara, while they would be most anxious to make themselves known; and the safest and most natural means of doing this would be to play our national air. Such modes of communication have been commonly employed from the time of Richard Cœur de Lion, ('Richard, O mon Roi!') down to Silvio Pellico. Had I, at Bokhara, heard a man humming 'Au clair de la lune,' I should immediately have been sure that a Frenchman was near, and should have whistled 'Dormez, dormez,' to show that I was 'wide awake.'"

Captain Grover proves, from Dr. Wolff's reports, that the accounts of the public execution of Colonels Stoddart and Conolly, for which Saleb Mohammed received 3000 rupees, and on the faith of which the name of as brave a man as ever wore the British uniform was struck out of the list of the army, must have been false. It will not appear remarkable, after what we have related of intentional diplomatic sacrifice, that government should have paid 3000 rupees for such information, although they would not contribute a farthing to the rescue of their suffering emissaries. Her majesty's government, in following out the same determination that these envoys should be publicly dead, whether actually alive or not, published in the papers a communication from the Russian minister to that effect: but to this day they have never published the contradictory statement received shortly afterwards from the British minister, Colonel Shiel; it did not suit their purpose to do so. After the disavowal of the envoys by their government, the Russians expressed their wish to convey them away in safety from Bokhara as travellers; but Colonel Stoddart refused to avail himself of such a dishonorable subterfuge. "Had I known," said the Russian envoy to Captain Grover, "that these gentlemen were agents of the government, I could have saved them at once."

The public owe a heavy debt of gratitude to the chivalrous and generous Captain Grover, for the uncompromising manner in which he has taken up this important subject. He throughout exposes the demoralizing results of such conduct, and the contempt brought by it upon the British nation in a masterly and unanswerable manner:—

"I consider it my duty," he says, in his address to the queen, "to state to your majesty, that the circumstances attending this extraordinary case are degrading to the British nation, and are of a nature to dim the lustre of your majesty's crown!"

It is sincerely to be hoped that the work of

Captain Grover, and the details which Dr. Wolff may soon be expected to communicate, will raise the authorities to a sense of what is due to the national dignity. If not, the nation itself must insist upon some effort being made to rescue her envoys, and to ensure the extinction of this newly-invented system of sacrificing honorable and brave men to political expediency. The thing must not stop where it now rests.

STEAM COMMUNICATION WITH FRANCE.

GREAT competition at present exists between the ports of Dover and Folkestone as to rapidity of communication with the French coast. The South-Eastern Railway Company having made Folkestone a principal station, and improved its harbor, several fine iron steamers were built and regularly connected with it—namely, the *Princess Alice*, the *Princess Mary*, the *Princess Maude*, and the *Queen of the Belgians*, which last vessel was launched only a few months ago. Each of these, in the order stated, was an improvement upon the former one, and was considered the fastest steamer in the world, until at length the Dover people, determined not to be outdone, induced the General Steam Navigation Company to send down the *Magician*, also an iron steamer, to ply between that port and Boulogne. The *Magician* has since proved herself equal in speed to the best of the Folkestone boats.

Another iron steamer has lately been launched, named the *Ondine*, to run on alternate days betwixt Dover and Boulogne, with the *Magician*; and a very lively interest has been created along both coasts as to whether the palm of speed belonged to the Dover or the Folkestone boats.

On the 2nd inst., the *Ondine*, in going from Dover to Boulogne for the Indian mail, on account of the *Morning Herald*, accomplished the run, thirty miles, in one hour and fifty-one minutes, the quickest passage, we believe, ever made. The inhabitants of Dover, Folkestone, and Boulogne were on the *qui vive*, as it was known that a trial would take place betwixt the *Ondine* and the *Queen of the Belgians*, which was waiting at Boulogne for the Indian mail on account of the *Times*.

On that occasion the *Queen of the Belgians* performed the distance in one hour and fifty-three minutes, beating the *Ondine* by sixteen minutes; but the cause of this apparent superiority was an accident to the *Ondine's* machinery, one of the slides having given way. But as on the previous day the *Ondine* had made the voyage in two minutes' less time—namely, one hour and fifty-one minutes—it was resolved by the owners that as soon as her machinery was repaired another trial of speed should take place on the first opportunity.

Everything having been set to rights on board the *Ondine* by the 13th inst., she proceeded on that day from Dover to Boulogne, to try her qualities with the *Princess Maude*, which has hitherto had the reputation of being the fastest boat on the station.

The following account of the interesting trial has been transmitted to us by eye-witnesses.

"The *Ondine* was put into the roads this morning, and went over to Boulogne to meet the *Princess Maude*, and met her accordingly about half an hour after she had left Boulogne. The weather was thick at the time, the wind blowing fresh; she

was, however, made out, the *Ondine* being to the windward of her. The *Ondine* bore down and hoisted her red flag of defiance. She took her station about a cable's length behind the *Maude*. Some few minutes elapsed before it could be told which of the vessels would prove the victor. The *Maude* had her staysail and foresail set. The *Ondine* soon set two sails also. In ten minutes the competitors were paddle-box and paddle-box, and in twenty minutes the *Ondine* was so far ahead that she actually put the *Maude* into her wake. The *Ondine* proceeded on to Folkstone, and when within about a cable's length of that harbor she hove to in sight of all the Folkstone people, who had apparently assembled to witness the issue. In eight or ten minutes the *Maude* passed close to the *Ondine's* stern, and went into the harbor. Knowing that she had to land her passengers and return to Boulogne, the *Ondine* waited, standing off and on, till she backed out; and when she had got her head right for Boulogne, and considerably ahead of the *Ondine*, the latter once more started after her, when a most interesting struggle took place. The *Ondine*, however, was soon again paddle-box and paddle-box with her opponent; the sea was very rough, and, apparently, the *Maude*, at times, shipped a great deal of water; the *Ondine* threw it off both sides of her paddle-boxes. When sufficiently ahead of the *Maude*, so as to run no risk, the *Ondine* crossed her bows and went round her!! thus demonstrating, a second time, the great superiority in speed of the *Ondine* over the *Princess Maude*. Both the *City of London* and *Magician*, in crossing to and from Boulogne and Dover, saw the trial, and bore to each place the news of the *Ondine* having gone twice round the *Maude* in so short a distance. It is the general opinion that the *Princess Maude* is superior to the *Queen of the Belgians*. The rate was seventeen and seventeen and a half miles per hour.'

This splendid little vessel, the *Ondine*, was built and fitted with machinery by Messrs. Miller, Ravenhill, and Co., of Blackwall. The engines of the *Ondine* are two fifties only, while those of the *Princess Maude* are, at least, twenty horse power more. The *Princess Mary*, the *Princess Alice*, and the *Queen of the Belgians*, were constructed by Messrs. Ditchburn and Mare.—*Morning Herald*.

From the Examiner, May 17.

HOW TO DEAL WITH IRISH TREASON.

WE were assured by Sir Robert Peel's admirers that the Maynooth grant was to be looked upon as earnest of more important measures of conciliation. What the happy effect of it has been, with the premier's adroit explanation of the unworthy motives for it, we need not repeat; but what has been the reception of the next act of grace, the establishment of the three lay colleges? Why, the Catholic organs denounce the plan, agreeing with Sir Robert Inglis that it is a scheme of godless education, and Mr. O'Connell condemns it as a plan as idle as ever came from the lips of man, and promises it all the negative opposition in his power.

Sir Robert Peel's conciliation seems to be tapering away very quickly, "small by degrees and beautifully less." For grant the first he got a little flummery, a few fair words of acknowledgment, of which he made the most; but for grant

the second he gets nothing but contempt. If this be his way of following up his appeasing measures, in what excess of exasperation will it end!

It is clear that as yet nothing but mischief has been done. The temper of Ireland is at this moment worse than it has been at any other time since the rebellion. The popular press teems with the worst sort of treason; not treason against the state, not the treason that would overthrow a form of government, but the treason that would arm one part of the population against another; a treason not against the crown, but against the people; a treason ready to league with any foreign foe, French, Russian, American, careless of the cause, no matter whether the ally be despot or democrat, enmity and injury to England being the only bonds of alliance regarded. There is nothing very heroic in this, it must be confessed. If seven millions of spirited people were as inflamed with wrong as the popular organs of Ireland represent, they should need no foreign aid; they would scorn to lie by waiting a juncture of difficulty or danger to their oppressors, but would straight, by their own power and a just cause, work out their own redemption. But allowing for much exaggeration, yet the anti-Anglican feeling prevails to such an extent, and is still so spreading, as to warrant serious apprehension for the future. The repeal agitation is a minor evil; the hostility of race to race is what we regard as the serious and menacing evil. Men hacknied in public affairs are likely to make light of this source of danger. The cry of wolf has been so often raised in Ireland that they think little of alarms in that quarter. But they have to observe that the mind of Ireland was never before at once so alienated and inflamed, and so marshalled as it is now. It is a thoroughly disciplined malignity, and while it is biding its time for mischief, it is making its time too.

Mark the language of the *Nation*, which, having enumerated the concessions that should satisfy Ireland, (with one or two exceptions judiciously selected,) proceeds thus:—

"But we fear that ere he (Sir R. Peel) would be induced to yield even a few of these just measures, the war should have got to its summer heat, the *American privateers* should have been busy with the ships of London, the tricolor of France should have begun to flutter, and the organization of 'the Irish brigades' have been reported forward by his New York spies.

"Fervently attached as the Irish are to the greatness of England, these events would doubtless cause them bitter agony. *How our coasts would be thronged with weeping citizens as the Yankee frigates floated by with their prizes.* How our corporations and reading halls would storm against the threatening French. Sure there would be moans in every cabin when the word passed on that the exiles were ready; and every parish would have its volunteer company preparing to expel the enemy.

"How painful to think that a struggle which would so peril England, and so distress Ireland, should be a means of gaining for us franchisees, tenures, representation, resident landlords, native administration, perhaps a native parliament! *How wicked of the minister to make his justice conditional on such events! How insane of him to avow that the cloud of coming war was full of benefits to Ireland!*"

But how is the state of feeling here represented to be dealt with? It is not unprovoked, though it

may exceed the provocation. It is encouraged, too. It is the only language that has succeeded with tory administrations. Appeals to reason, justice, humanity, have been slighted; wrongs have been and still are insolently persisted in, and the only avowed motive for any act of grace or equity is fear. Can we then wonder that menace, which alone has been successful and encouraged, is carried to the pitch we witness. And though vapor, yet as vapor it is not to be despised; for we must not be too sure that the vapor is not of that sort which fires and explodes in a great mine of disaffection.

There is but one safe way of dealing with it, and of the causes under it—the removal of every ground of just complaint, the establishment of a thoroughly impartial system of government, placing the Catholics in every respect on an equal footing with the Protestant portion of the community. England having thus put herself in the right towards Ireland, freed herself from the incumbrances and impediments of unjustifiable provocations, her course, if the enmity should survive the causes, and threaten her peace and safety, would be of that firm and bold character in which true prudence lies. She would not wait to be stabbed in the side when attacked by a foreign foe in front. With all parties united in Great Britain, and with the reasonable part of the Irish nation coöperating, she would put down the treason before its opportunity of mischief arrived. As the *Morning Chronicle* remarks, "They who announce beforehand their intention of resorting to civil war, are not always allowed to bide their time, and to wait their opportunity; and if the leaders of *Conciliation Hall* (what an appropriate name!) continue to go on declaring that it is their intention to join the enemy on the first occasion when their country may be at war, it is just possible that this intention of theirs may be defeated beforehand, in a manner somewhat inconvenient to them."

While England is, however, to any extent in the wrong, there would not be the union necessary to coping with the intentions in question. Full justice must first be done, conciliation in the largest sense exhausted, before resort to such means as the self-preservation of the empire may dictate.

Much important time has already been culpably lost. First, there was the loss of time in the policy of doing nothing; next, in the more abortive plan of repression through injustice; and now, in these petty palliatives, while the great oppressions and affronts are maintained. Every day that the reforms, which must come at last, are delayed, the evil spirit of hatred to England is growing, and the probability of its dying away with the removal of the irritating causes is diminishing. The rate at which the Sybil's books are burning may be marked in the reception of Sir Robert Peel's concessions, such as they are, and the time may come when the tardy discharge of the debt of justice to Ireland, though it may relieve the conscience of England, will be unavailing to the restoration of concord between the races, a result which we regard as the most baneful calamity that can befall the empire.

ELECTRIC TELEGRAPH.

We understand it is the intention of government, in conjunction with the Chester and Holyhead Railroad Company, to have the electric tele-

graph established on that important line, reaching from London to Holyhead, a distance of between 200 and 300 miles, and embracing in its route the commercial capitals of Liverpool, Manchester and Birmingham. The adoption of this invention on a scale of magnitude bids fair to effect a change in the entire correspondence of the country, by bringing, as it were, momentarily into close consolidation and communion the exchanges of London, Liverpool, Manchester, and Birmingham, conveying with lightning-like velocity every fluctuation of affairs, and telegraphing from mart to mart, with marvellous exactitude, and over areas of hundreds of miles, intelligence that may be received and reciprocated almost simultaneously by every mercantile community in the kingdom. Great advantages have already been developed to the admiralty and commercial world by its adoption between London and Gosport. The old semaphore system is now nearly superseded, and important government orders and intelligence, that formerly occupied hours in transmitting by the ordinary semaphores between London and Portsmouth, are now forwarded and fulfilled in a few seconds, the communicating wires which will shortly be carried from Nine Elms to the Admiralty, at Whitehall, terminating in the very barracks of the garrison at Gosport. The establishment of telegraphic communication between Liverpool and Holyhead, Lloyd's and London, will give every facility for shipping purposes; and in this respect the invention has worked most efficiently between London and Southampton, where, as at Gosport, there is a telegraph station, telegraphic notices being daily despatched, on the arrival of important mails and merchantmen. The advantages, moreover, that may accrue from a line of wires to Holyhead, in establishing a closer connexion between the metropolis and the sister isle, is of a nature not to be overlooked, either in a political or social point of view. Lines of telegraph, we understand, have been or are about being adopted on the following, amongst other, lines:—On the South-Western, as a government telegraph for the Admiralty to Portsmouth, 90 miles; on the same line, as a commercial telegraph, from Nine Elms to Southampton, 77 miles, with branch to Gosport, 21 miles; on the South Devon atmospheric line, now in progress, 52 miles; on the Great Western from Paddington to Slough, 18 miles; on the Yarmouth and Norwich, 20 miles; on the Dover line, from Tonbridge to Maidstone, 15 miles; on the Croydon atmospheric; on the Blackwall; on part of the Manchester and Leeds, and its branch to Oldham; on part of the Edinburgh and Glasgow; upon the Dalkey atmospheric branch of the Dublin and Kingstown, applicable alike to the conveyance of commercial intelligence and to the safe conduct and working of the line. The above embraces an extent of nearly 250 miles over which the telegraphic principle is already in operation; and its adoption between London, Liverpool, Manchester, Birmingham, and Holyhead will add about 300 miles more.—*Globe*.

In a letter to a clerical friend, the Reverend Theobald Mathew announces that his debts have now all been liquidated, to the amount of 7,000*l.*, principally by contributions from England, with some partial aid in Ireland. [What has become of the annuity that was to be secured to Mr. Mathew? Was not Mr. O'Connell to be active in that behalf?]

From the Examiner.

IMPUNITY OF MILITARY MISCONDUCT.

A CORRESPONDENCE between Mr. Barker, of Drury Lane Theatre, Captain Sutton, of the 7th Hussars, and the commander-in-chief, the Duke of Wellington, has been published by Ridgway, under the title of *Impunity of Military Insolence and Licentiousness*. The question involved in it is of no small importance to society, as it relates to the security of female reputation.

The main facts seem briefly to be these: Sir W. Russell, of the 7th Hussars, publicly stated that Captain Sutton had boasted of a criminal intercourse with Mrs. Barker. The husband wrote to Captain Sutton, asking whether he had ever uttered such a boast. The reply was, that he (Captain Sutton) had never mentioned the name of the lady in any disrespectful or disparaging way.

Mr. Barker then called upon him to take steps to contradict the calumny circulated, on his alleged authority, by his friend. Captain Sutton's answer to this, in no very intelligible style, was, in effect, that, as he found upon inquiry that Sir W. Russell and another gentleman had not spread the report, there was nothing more to be done, and with this curt decision he peremptorily closed the correspondence.

The husband, on the contrary, avers that he was prepared to prove that the calumny had been extensively circulated.

Upon this stage of the case Mr. Barker remarks, in a memorial to Colonel Whyte, in command of the regiment—

"It is to be observed, that Captain Sutton has not denied that Sir William Russell had stated that he had heard him, Captain Sutton, boast of an intrigue with Mrs. Barker. As he does not deny this important fact, he must be understood to admit it. Captain Sutton denies, indeed, that he ever spoke disrespectfully or disparagingly of Mrs. Barker, which is tantamount to a denial that he ever uttered the gross calumny attributed to him, but this leaves either Sir William Russell or him committed to an untruth.

"It might have been expected that Captain Sutton would have followed up his own denial of the calumny, by immediately procuring from Sir William Russell an admission that he had grossly misrepresented him, (Captain Sutton,) in citing him as his authority; this is the course which a gentleman of truth and spirit would have naturally taken, in such a case, but nothing of the sort has been done by Captain Sutton. He appears to have rested content with denying that he had uttered the slander, which Sir William Russell declared publicly and notoriously he had spoken.

"If such a wrong as has been done to my wife, in this case, can be committed with impunity, and without reparation, what woman's character can be secure, what reputation may not be blasted by the same cruel sort of attack?

"Upon the avowal of a boast, the character is defamed, described as the most wanton and infamous, the alleged boaster when called upon denies, makes protestations to the contrary, but will do no more; he is asked, as an act of mere justice, to do what lies in his power to correct the wrong that has been done on the abused authority of his name, he cavalierly refuses, and does not even show that he has made the repeater of his

alleged boasts conscious that he has promulgated a gross and injurious falsehood.

"Surely, when a man of honor finds that the authority of his name has been used to give currency and credit to a calumnious falsehood, he feels bound to use all the means in his power to counteract the mischief, and he regards the person who has taken such unwarrantable liberties with his name, and misrepresented his words, as guilty of a wrong to himself, only second to that to the cruelly aspersed woman.

"The laws of honor, indeed, imperatively forbid such practice, and to the rules for the regulation of the army, I therefore make my appeal, to protect me and mine against the injurious effect of it in this instance; and I trust that measures will be taken to ascertain the fact, whether one gentleman bearing her majesty's commission has falsely reported a brother officer to have made the statement, that he had a criminal intimacy with my wife, or whether another gentleman bearing her majesty's commission has falsely denied such statement, he having made it?"

Colonel Whyte refused to interfere, on the score of the impracticability of a military inquiry requiring the testimony of several civilians not amenable to the jurisdiction. Mr. Barker then carried his appeal to the commander-in-chief, and was informed by Lord Fitzroy Somerset that his grace could not interfere, as the subject of complaint could only be fully investigated and decided upon by the civil tribunals.

Upon this he took counsel's opinion, and was advised by Mr. Peacock that an action could not be supported unless special damage could be proved.

So that under our boasted laws any unscrupulous boaster can claim any married woman as his mistress with impunity, provided that no specific damage can be traced and proved (and the damage may have been done, though it may not be detected.)

The higher the character of the woman, indeed, the greater the safety of her slanderer; for if her reputation be so fair as to forbid belief in the story, no special damage results, and no action consequently can lie. If her repute be less good, and the tale be accordingly credited and acted upon to her prejudice, there may be a case for redress. What a monstrous absurdity is this, denying protection to the characters most deserving of it.

Let it not be said that the good repute is the sufficient protection. A virtuous woman's name cannot be so indecently brought into question without an injury and pain to her, which she has a right to be spared, and which it is a scandal to the laws for her to be subjected to.

Finding that he could have no redress from the civil tribunals, Mr. Barker again appealed to the commander-in-chief.

"Your grace having declined to take cognizance of my complaint under the impression that it fell within the jurisdiction of the civil tribunals, which, unfortunately, proves not to be the case, I now again most respectfully renew my appeal to your grace to afford me that justice which it is now certain can be obtained in no other quarter.

"It is a boasted maxim that there is no wrong without a remedy. Is it no wrong that Sir William Russell has publicly declared that Captain Sutton had boasted of a criminal intercourse with my wife, and that he could sleep with her when-

ever he liked? And for this wrong, so wanton, so thoroughly unprovoked, so cruel, so intolerable, I have yet in vain sought the redress which is said to be obtainable for every wrong. The law, as your grace will see, does not afford me a remedy, because I am unable to discover and adduce any specific damage as the direct consequence of the calumny. It is not for me to point out to your grace the great hardship and anomaly of this point of law, the worst working of defamation being in its subtlety, and that good opinion is lost, and ill opinion formed in place of it, without any avowal or betrayal of the causes.

"I cannot but feel confident that your grace will comply with this prayer, because every one must be aware that the discipline of the army cannot coëxist with a license outraging both manners and morals. The uniform of an officer has hitherto been supposed to be a guarantee for truth and honor; but if it can be worn by men permitted with impunity to indulge in boasts, profligate and base if true, unutterably wicked and villanous if false, there must be an end to the respect in which the service has as yet been held, and a serious diminution of the self-respect of the members of the profession; for true gentlemen must feel degraded by finding that conduct not only unworthy of gentlemen, but disgraceful to men in any condition of life, is permitted and suffered in the service to which they belong.

"I rely then on cognizance of my case by the military tribunals, because the charge which I am well prepared to maintain, impugns the truth and honor of officers, and because vital to the discipline of the army as upholding the standard of conduct in its officers, and correcting any license which would involve them in disgraceful quarrels, and subject them justly to public odium. If I am not much misinformed, this principle of policy in the military administration may be traced in various proceedings taking cognizance of conduct not directly relating to technical points of discipline, but bearing importantly on the higher essential of discipline—gentlemanly conduct.

Your grace's anxiety to discountenance and repress duelling in the army has not been unmarked by the public; and it is calculated to encourage me in the expectation that your grace will be as determined to repress the spirit of insult and injury, and to check intolerable provocations, as to prevent the settlement of quarrels arising too often from such causes, in the mode which has so long had the sanction of evil custom."

To this the Duke of Wellington replied as follows:—

"Field Marshal the Duke of Wellington presents his compliments to Mr. Barker.

"The officers of the army are, equally with all her majesty's subjects, amenable to the courts of law, for any offence which they may commit, or any injury they may do to any individual.

"The act complained of, whether alleged to have been committed by Sir William Russell or Captain Sutton, if not a calumny, slander or defamation, or a provocation to a breach of the peace, by one or both of these officers cognizable by a court of law, cannot be considered a breach of military discipline.

"It may be a slander or calumny by Sir William Russell against Captain Sutton.

"It may be a slander, calumny, or defamation by one or both officers against Mrs. Barker, of which a court of law would take cognizance

if criminal, or affording ground for civil proceedings.

"But if not considered an offence at law, it does not appear practicable to constitute a military offence; and to found it upon loose conversation, however reprehensible."

To this unmeaning twaddle, which amounts to this nonsensical conclusion, that, if the act complained of was not an offence against law, it could not be a breach of military discipline, there being notoriously a multitude of breaches of military discipline which are no offences at law, Mr. Barker rejoined thus—

"I beg most respectfully to remind your grace, that it is not as a breach of military discipline that I have solicited your cognizance of the conduct in question, but as ungentlemanly conduct, which is so closely connected with military discipline, that the 31st article of war provides that 'any officer behaving in a scandalous, infamous manner, unbecoming the character of an officer and a gentleman,' shall be tried by court-martial, and punished on conviction.

"I submit, then, to your grace, that the slander of an innocent woman is scandalous, infamous, and unbecoming the character of a gentleman. I submit also that the utterance of a falsehood is scandalous, infamous, and unbecoming the character of an officer and gentleman.

"I beg to repeat that I am fully prepared with proof, that either Captain Sutton has told a falsehood in denying that he ever uttered the calumnious boast attributed to him by Sir William Russell, or that Sir William Russell was guilty of falsehood, in asserting that such slanderous boast was ever made by Captain Sutton.

"One of these officers must be guilty of falsehood, the thing most 'scandalous, infamous, and unbecoming the character of a gentleman;' and coming, therefore, most strongly within the description of the misconduct for which the articles of war direct the cognizance of the military tribunals.

"My charge is two-fold; first that a wicked calumny has been spoken of my wife; secondly, that in the very denial of that calumny by the officer to whom it was attributed, the conclusion is inevitably involved, either that the denial is a cowardly falsehood, or that the original representation (that of Sir William Russell) was a wanton falsehood, and double calumny—a calumny upon Captain Sutton, described as a profligate boaster, and a calumny against my innocent wife.

"If this be not the conduct unworthy of the character of a gentleman, for which the articles of war provide cognizance and punishment, what vice or villany can come within the scope of the words?

"Your grace writes lightly of 'loose conversations,' but slander must be conveyed in conversation, and the malignity of its purpose and cruelty of its effect are not diminished by attaching the epithet 'loose' to the vehicle or mode of promulgating it.

"I find that there are many precedents for cognizance of conduct, not involving any breach of military discipline in the technical sense of the term, and I beg most respectfully to draw your grace's attention to one case in point, in which the offence seems far less grave than that of which I complain.

"There was a race ball, at the Bell Hotel,

Gloucester, in September, 1831, at which were present two officers, one Captain _____ of the _____ infantry* _____ the other Lieutenant _____ of the _____ dragoons. Two stranger ladies were introduced by Captain _____ and Mr. _____; after a time one of the Gloucester gentlemen (believed to be Mr. Goodrich) expressed an opinion as to the character, &c., and description of the ladies, and as Captain _____ declined to give any explanation as to who the ladies were, the suspicion was strengthened, and subsequently confirmed; a great sensation was excited, and the ladies expelled, and the gentlemen (the officers) left too.

“After some time Mr. Goodrich represented the circumstances to Colonel _____ of the _____ Dragoons, and he brought it under the notice of the officers, and Lieutenant _____ was offered his choice of sending in his resignation, or to stand a court-martial; he preferred the former and left the regiment.

“A similar representation of the facts was afterwards made to his Royal Highness the Duke of _____ (Colonel of the _____), and Captain _____ was called on to leave the regiment, which he did, it is believed, at the recommendation of a court of inquiry.

“The ladies were from London, and had been intimate with Captain _____, and followed him to Cheltenham, and he brought them to Gloucester. Captain _____ had known Lieutenant _____, and prevailed on him to join him in this frolic, after dining with him. Mr. _____'s case excited considerable sympathy at the time, as he was not the original offending party, and it was in consequence of this feeling that Captain _____ was complained of to his commanding officer.’

“The act complained of in this instance was ‘not cognizable by a court of law,’ and ‘could not be considered a breach of military discipline,’ and nevertheless the military authorities were prepared to grant a court-martial if the officers implicated had not preferred the offered alternative of retiring from the service.”

The duke, in reply, referred to the drivelling letter above quoted, and declined any further correspondence.

The Duke of York, we are sure, would have come to a very different conclusion. He would not have allowed a charge of falsehood to rest upon one of two officers without clearing it up one way or the other, and either disproving it or relieving the service of the officer who had brought disgrace on it.

The doctrine that a charge of falsehood does not come under the class of offences against discipline, in behavior unbecoming the character of an officer and a gentleman, has been reserved for the Duke of Wellington's advanced age. The boast of an intrigue may be licensed in the new chivalry of the army, but that is not all in this case; the alleged boaster denies the boast, and he and the brother officer who so reported him are left most awkwardly at issue as to a matter of fact. The question to be answered, as Mr. Barker has shown, is, has Sir W. Russell slandered Captain Sutton, or has Captain Sutton in effect slandered Sir W. Russell, by denying words which the other truly asserted he had uttered? Is it for the credit and honor of the service that such questions as these should remain unanswered?

* In the statement sent to the commander-in-chief the names and regiments are given.

PORCELAIN PAINTING.

Mrs. M'IAN has given a report to the Council of the Government School of Design, of a journey undertaken by her to Paris, and to the Staffordshire Potteries, during which she inspected the processes of porcelain painting at the different manufactories; the result of her comparison of the artists of the two countries is by no means unfavorable to English ability.

At Messrs. Copeland's manufactory, in Staffordshire, more especially, she saw specimens of flower painting in porcelain, equal to the best productions at Sèvres, where that branch is most admirably executed. This, she remarks, implies, in the English artist, a much greater degree of merit, because he has been wholly unassisted; development of talent being left to individual energy and perseverance; whilst in France he has had the advantage of systematic and special training for the employment, and the emulating patronage of a royal manufactory, munificently supported by the government.

The colors used by the French, she observes, are superior to those of the English; for flesh tints, they have reds and yellows, that will mix and burn together, which, with the colors used in our potteries, is chemically impossible; the media made use of by the French are also superior. In neither country is there any attempt at originality in design, the artistical labor consisting in a continual process of copying. Mrs. M'ian thinks that if, in the Female School at Somerset House, a class was formed for studying the art of painting porcelain in a superior manner, the more skillful pupils would find employment at their own homes, as the manufacturers would be happy to transmit to them work for execution.

From the Examiner, 17 May.

AMERICAN DESIGNS REGARDING OREGON.

MR. CALHOUN, after having recapitulated the history of the Oregon negotiations, asks—

“Has the time arrived when it would be wise and prudent for us to attempt to assert and maintain our exclusive right to the territory against the adverse and conflicting claim of Great Britain? I answer—No, it has not; and that for the decisive reason, because the attempt, if made, must prove unsuccessful against the resistance of Great Britain. We could neither take nor hold it against her; and that for a reason not less decisive—that she could in a much shorter time, and at far less expense, concentrate a far greater force than we could in the territory. We seem to forget, in the discussion of this subject, the great events which have occurred in the eastern portion of Asia during the last year, and which have so greatly extended the power of Great Britain in that quarter of the globe. She has there, in that period, terminated successfully two wars; by one of which she has given increased quiet and stability to her possessions in India; and by the other, has firmly planted her power on the eastern coast of China, where she will undoubtedly keep up, at least for a time, a strong military and naval force, for the purpose of intimidation and strengthening her newly-acquired possession. The point she occupies there, on the western shore of the Pacific, is almost directly opposite to the Oregon territory, at the distance of about 5,500 miles from the mouth of Columbia river, with a tranquil

ocean between, which may be passed over in six weeks. In that short time she might place, at a moderate expense, a strong naval and military force at the mouth of that river, where a formidable body of men, as hardy and energetic as any on this continent, in the service of the Hudson Bay Company, and numerous tribes of Indians under its control, could be prepared to sustain and cooperate with it. Such is the facility with which she could concentrate a force there to maintain her claim to the territory against ours, should they be brought into collision by this bill. I now turn to examine our means of concentrating an opposing force by land and water, should it become necessary to maintain our claim. We have no military or naval position in the Pacific Ocean. Our fleet would have to sail from our own shores, and would have to cross the line and double Cape Horn in 56 degrees of south latitude; and turning north, recross the line, and ascend to latitude 46 north, in order to reach the mouth of Columbia river—a distance from New York (over the straightest and shortest line) of more than 13,000 miles, and which would require a run of more than 18,000 miles of actual sailing on the usual route. Instead of six weeks, the voyage would require six months. I speak on the authority of one of the most experienced officers attached to the Navy Department. These facts are decisive. We could do nothing by water. As far as that element is concerned, we could not oppose to her a gun or a soldier in the territory. But, as great as are the impediments by water, they are, at present, not much less so by land. If we assume some central point in the State of Missouri as the place of rendezvous, from which our military force would commence its march for the territory, the distance to the mouth of the Columbia river will be about 2,000 miles; of which much more than 1,000 miles would be over an unsettled country consisting of naked plains or mountainous regions, without provisions, except such game as the rifle might supply. On a great portion of this long march the force would be liable to be attacked and harassed by numerous and warlike tribes of Indians, whose hostilities might be readily turned against us by the British traders. To march such a distance without opposition would take upwards of 120 days, assuming the march to be at the usual rate for military forces. Should it be impeded by the hostilities of Indians, the time would be greatly prolonged. I now ask, how could any considerable force sustain itself in so long a march, through a region so destitute of supplies? And how could supplies be found to return, if a retreat should become necessary? A few thousand regulars, advantageously fortified on the Columbia river, with a small naval force to support them, could, with the aid of the men employed by the Hudson Bay Company, and the cooperation of the Indians under its influence, bid defiance to any effort we could make to dislodge them. If all other difficulties could be surmounted, that of transporting a sufficient battering-train, with all its appurtenances, to so great a distance, and over so many obstacles, would be insuperable." After showing that Great Britain would infallibly resist, and that America would have no chance, Mr. Calhoun continues:—"But it may be asked, 'What then? Shall we abandon our claim to the territory?' I answer, 'No.' I am utterly opposed to that. The territory has

commercial advantages, which will in time prove to be great. We must not overlook the important events to which I have alluded as having recently occurred in the eastern portion of Asia. As great as they are, they are but the beginning of a series of a similar character, which must follow at no distant day. What has taken place in China will in a few years be followed in Japan, and all the eastern portions of that continent. Their ports, like the Chinese, will be opened; and the whole of that large portion of Asia, containing nearly half of the population and wealth of the globe, will be thrown open to the commerce of the world, and be placed within the pale of European and American intercourse and civilization. A vast market will be created, and a mighty impulse will be given to commerce. No small portion of the share that would fall to us with this populous and industrious portion of the globe, is destined to pass through the Oregon territory to the valley of the Mississippi, instead of taking the circuitous and long voyage round Cape Horn, or the still longer, round the Cape of Good Hope. It is mainly because I place this high estimate on its prospective value, that I am so solicitous to preserve it, and so adverse to this bill, or any other precipitate measure which might terminate in its loss. If I thought less of its value, or if I regarded our title less clear, my opposition would be less decided."

Mr. Calhoun then goes on to show that the only means by which Oregon can be secured is to bide our time. "All we want," says he, "to effect our object in this, is *wise and masterly inactivity.*"

From the Congregational Magazine.

AND IS THERE CARE IN HEAVEN?

"And is there care in heaven? and is there love
In heavenly spirits to these creatures base?"—SPENCER.

Oh that this palled but hungry soul, could find
That bread of life which stays the fainting mind,
Drink of that living spring whose waters flow,
At once to cleanse the heart and heal its woe;
Or catch some kindly voice, whose cheering sway
Might wake this palsied will to soar away,
Trusting no more its refuges of lies,
Touched by a power descending from the skies,
In showers as gentle as the summer dew
That dropt on Hermon, and as copious too.

Oh! to launch forth from earth's perplexing dream;
Oh! for a draught of that immortal stream,
Which, redolent of heaven transports us there,
And on its crystal wave makes haste to bear
The sympathies of angels back to men,
And raise the spirit from the dust again!
Are they not ministers who day and night
Stand round the throne in robes of spotless white?
And all the care these bending myriads know,
Lives it not only for this world below?
And thrills there not even in this widowed breast,
A chord in tune with those which never rest,
Cold though it be, and impotent to raise
Its voiceless breathings in the Father's praise?

Yes there are cares and sympathies above;
And earth, the wedded of those realms of love,
Partakes the glory, and reflects the bliss,
When that world's fulness overflows on this.

From the Spectator.

MAYNOOTH: A VOICE FROM THE PAST.

THE Protestant Gathering, in the course of their church-militant agitation, have concocted a circular in support of "our common Protestantism," which bears the respectable signature of their chairman, Sir Culling Eardley Smith, and has been freely addressed in all directions. Unluckily, as it turns out, one of these letters-missive was sent to the Very Reverend Heneage Horsley, the son of that Bishop Horsley whose "mighty spear," in the words of Gibbon, "has repeatedly pierced the Socinian shield of Priestley;" whose labors in the cause of biblical literature show that to zeal he united knowledge, (which is not always the case;) and whose Toryism, or rather whose resistance to unconstitutional change in church or state, is well known. A short residence in Ireland, added to other opportunities has convinced Mr. Heneage Horsley that "there are but two ways by which the Irish church can be preserved: the one is, by acts of conciliation, similar to the one now pending in Parliament; the other, by holding Ireland as a conquered province; to accomplish which, it will be necessary to maintain constantly within her borders a standing army of not less than 60,000 men." Mr. Horsley, therefore, could not go along with the views of the exclusive Protestants of Exeter Hall and the Crown and Anchor; and having, a year or two ago, before this Maynooth extension was thought of, explained his opinion to the Archbishop of Dublin, he did not feel inclined to submit to the imputation of a want of Protestant principle, which the Crown and Anchor circular imputes to those who refuse to admit the infallibility of the self-elected holinesses. Instead, however, of putting forward his own arguments, Mr. Horsley, in a short pamphlet before us,* falls back upon his father; and shows, by extracts from his speeches in the house of lords, from 1794 to his death, that, *fifty years ago*, Bishop Horsley was prepared to advance further than Sir Robert Peel is even now—that, besides advocating the abolition of the penal laws to the extent of Catholic emancipation, he was really prepared to recognize the Pope, and pay the Roman clergy. These extracts are interesting for their vigorous and manly style; but still more curious for their suggestions. How slow is the progress of opinion and "the march of mind!" Half a century ago, all the great political leaders of every party—Pitt, Fox, Burke, Grenville—were anxious to concede Catholic emancipation, to endow the priests, (if paying them is endowment,) and to open up diplomatic relations with Rome; whilst one of the most eminent prelates and stoutest champions of the established church was willing to march with them *pari passu*. Now, a miserable addition of 17,000*l.* a year is denounced as "destructive," and "damnable," and certain to draw down the direct vengeance of Heaven upon the whole country by those who take upon themselves to

"Deal damnation round the land."

Yet as a matter of principle, it is impossible to

* A Letter from the Very Reverend Heneage Horsley, to Sir Culling Eardley Smith, Bart., on the subject of the Maynooth Grant; embodying the opinions of the late Bishop Horsley, on the policy and necessity of extending measures of legislative relief to the Roman Catholics. Published by Longman and Co.

suppose that such a Protestant monarch as George the Third would ever have permitted the original establishment of Maynooth, could the most lynx-eyed bigotry, in a state of reason, have detected Romanism in it: and with respect to amount, a large addition might be claimed as a mere matter of bargain, from the increase in prices, the more expensive, the *gentleer* style of living among the middle classes, and, greater than all, the effect which our improved and improving modes of locomotion have had in equalizing prices between the capital and the provinces. All things considered, it is probable that 1,000*l.* a year, in Ireland in the last century, was equal in real value to at least 2,000*l.* now.

There is more of Bishop Horsley than of his son in this letter to Sir Culling; the writer's own arguments are chiefly incidental or subordinate. Two points, however, are so well put—the talk about the uselessness of "conciliation," and the fact of the state of Maynooth (denied by some Protestant orator)—that we will quote them for the benefit of Sir Robert Inglis and the rest, who will come up on Monday like giants refreshed to oppose the third reading.

"I have heard it frequently asked, in the course of my last visits, and more than once in the four days I have now been here [in Dublin]—what is the use of *conciliation*? what benefit is to be expected from it? what good has it as yet effected? *CONCILIATION*, sir! why, this is surely mockery. Does anything which the British parliament has as yet done to improve the condition of the Roman Catholics in Ireland, when the manner of the doing of it, and the delay in the doing of it, are taken into consideration, deserve the name? The old adage, '*Bis dat qui cito dat*,' is in no instance of greater force and verity than when applied to cases of legislative grace and favor. When conferred *promptly, cheerfully, and freely*, they do win the hearts and affections of those on whom they are conferred; but when wrung from an unwilling senate *by fear and apprehension*, they are totally valueless. Where, in the name of all that is equitable and just, has been the '*cito*,' in the all-viatory dealings of England with Ireland?

"I remember well the period of the union. I was then at an age when the discussion of such topics of exciting interest by men of powerful minds, as those topics were that were connected with that measure, leave a lasting impression on the mind. It was my good fortune frequently to hear such discussions, at the table of my father, of Lord Thurlow, of Mr. Windham, of Sir John Cox Hipplesey. On all these occasions, and on several others of a similar kind, I heard it averred again and again, that one of the most powerful inducements employed to reconcile the Irish people to the union, was an *explicit promise* given by the then rulers of the country, that emancipation, or in other words the repeal of the penal laws, should follow '*hard upon*.' Was a delay of nine-and-twenty years a following hard upon? No wonder, sir, that hope so long deferred made the hearts of the Roman Catholics sick. No wonder that a people should fret and groan, and become clamorous, unruly, and turbulent, under such long-procrastinated justice. Then again, this silly—for silly it really is—*Protestant* agitation, and revival of the absurd '*No-Popery*' cry about Maynooth!! Sir Culling, I have visited the establishment there. Two years ago, I narrowly inspected all its miserable, and wretched, and destitute, and, I

will add, (I mean no offence, for it must be the poverty of its means and not the will of its directors that consents,) its *dirty*, and *nasty*, and *filthy* economy; and I confess, sir, I blushed for the meanness of my countrymen, that can dignify the paltry pittance their government at present doles out to the institution, with the title of an act of bounty to the Irish Roman Catholic church.

"No, sir; such acts of bounty and conciliation will effect nothing. They must be of a different character: more in number, and more promptly (or they will come too late) and more cheerfully rendered: and even then it will take time to soften down and entirely extinguish the asperities and bitterness of feeling which a long train of injury and oppression have engendered. But, under God, time will extinguish them."

From the Spectator.

SIDNEY'S LIFE OF LORD HILL.

THE late Commander of the Forces was rather a good lieutenant than a great captain. His orderly habits and his kindness of heart made him an excellent administrator; for his influence extended not merely to material but to moral results. His military skill, his courage, and experience, rendered him a successful subordinate, as his prudence made him a safe commander: nor was he devoid of daring conception and "warlike wiles" in secondary affairs. But he was too merely a soldier ever to have been a great chief; who must have a large portion of the statesman in his capacity, to plan his campaigns with a view to ultimate effects, to render his victories resultful, and his defeats only a *pro tanto* loss, not entire destruction. As far as fighting goes, mere soldiers may often fight battles not less skilful, and much bloodier, than the Marlboroughs, Bonapartes, or Wellingtons; but the "be-all and end-all" is so many killed, wounded, and missing. The operations do not, like Blenheim or Ramilies, Marengo or Montenotte and its suite, the passage of the Douro or Torres Vedras, (without fighting at all,) clear a country of the enemy. Lord Hill wanted this larger power; for although it may be said that he had no opportunity of displaying his qualities as a commander, it is tolerably certain that he could not seize them when working out before his eyes. It seems clear from his letters when he was with the army in the Peninsula, that he had not a glimpse of the strategy of his chief, but thought that the occupation of Portugal was dependent on what a day might bring forth.

In justice, however, to this worthy English gentleman, it should be said that he made no pretensions to be chief or politician, but had the good sense to refuse office in either capacity. In 1827, the command of the Forces in India was offered him, but declined, partly on account of his health. He was twice offered the Ordnance: and the last time he gave his reasons for refusing the Mastership, in a letter to the premier, Lord Goderich.

"My feelings of gratitude," he said, "for so marked a proof of his Majesty's gracious favor, are, if possible, increased by the very flattering terms in which your lordship has been pleased to address me on the subject. It will probably be in your recollection, that when offered the Lieutenant-Generalship of the Ordnance some years ago by my friend the Duke of Wellington, I assigned the following reasons for declining it—namely,

that I had never been accustomed to office duty; that I feared I should ill perform the services required of me; and that a permanent residence in town would most materially affect my health.

"As these objections still remain in full force, it would be inconsistent in me to accept an appointment of so much greater importance, the duties of which I am informed are not confined to the military profession alone, but are intimately connected with the financial expenditure of the country."

But if not a very great, Lord Hill was a very good man. In boyhood his tenderness of disposition had been so remarkable, that his old schoolmistress could not afterwards believe that Hill was conspicuous in the bloody battles of which the newspapers were full: and the same kindness of feeling attended him through life, except when professional duty interfered. His domestic affections were strong, and equally permanent: the same may be said of the simplicity of his tastes. During the most bustling period of the Peninsular war, and in the height of his greatness as commander-in-chief, his letters to his family are full of home affections, and home reminiscences of dogs, plants, field-sports, and neighbors. The love of gardening and rural improvements stuck to him to the last; and a short time before his death, in his last letter, he is full of a pond he appears to have been draining.

The family of the Hills, though unennobled, was old and respectable—one of that "Old English gentleman" class which is perhaps peculiar to England, and has strongly operated upon the national mind. This, in fact, was the character of the general himself; and, according to one of his officers, his appearance greatly influenced the rustic recruits, he looked so much like a country gentleman in regimentals; whilst serious soldiers from the towns looked up to him for his relationship to the Reverend Rowland Hill—whose fame, good man, is dying away. His mind was as much affected by his real status as his appearance. He had none of the genius of the adventurer, and none of his vices, or pretence, or littleness. A dutiful loyalty to the crown was an impulse of his nature; but beyond this, he seems to have looked upon life with a philosophic eye—weighing wealth, rank, and fashion, as extrinsic circumstances, and taking his own advancement very quietly, as something that came to him in return for services, and to which he was entitled, but not as a thing that had changed him. Nor, in truth, did it seem to have enlarged his comprehension: his rage might expand with his elevation, but his style of considering things was much the same.

There is nothing very striking in the life of Lord Hill beyond what is known from the Gazette. He was born in 1772; and having chosen the army for his profession, was sent to a military academy at Strasburg. He was appointed to an ensigncy in March, 1791; and in 1800 had attained the rank of colonel, through luck, interest, and strict attention to his duties, conjoined with his services at Toulon. He subsequently served in Egypt and Ireland; went with the absurd expedition to the Weser; was with Moore during the Corona campaign; embarked with Wellington on the first expedition to Portugal; served throughout the whole of the Peninsular war; and commanded the army in the Netherlands during the Hundred Days, till Wellington's arrival from Vienna. In 1828 he was appointed to the office

of commander-in-chief; he resigned it from failing health in August, 1843; and died in the following December.

The volume which gives the narrative of Lord Hill's life is not so overdone as many late biographies; but it is not a very striking or skillful production: being impeded by reflections, and interrupted by needless remarks upon the original materials the author is using. We suspect the hero had better have been allowed to tell more of his own story, by means of his correspondence, and the journal or memorandums of his life that he was in the habit of keeping, and which are used by bits in the volume before us. The true function in Lord Hill's case was an arranging editor rather than a compiling biographer: for the real value of the work consists in its anecdotes and letters, which require little more than telling or explaining. Many of these are interesting from their domestic character, or from the persons and events to which they relate. We will take our extracts from the latter class. The following letter from the Duke of Wellington exhibits the duke's way of offering a loan, Hill's father having got involved in difficulties. The offer is handsome, liberal, and business-like; settled at once, without any necessity for further discussion.

"Paris, 20th Feb., 1816.

"My dear Hill—I received only yesterday evening your letter of the 16th; and I am very much concerned for the unfortunate circumstances which have occasioned the necessity for your return to England. I consent to it, as well as to that of Sir Noel. Let him apply through the official channel; but he need not wait for the answer.

"In the existing state of public and private credit in England, I am apprehensive that you will find it difficult to procure the money which you will require. I have a large sum of money which is entirely at my command; and I assure you that I could not apply it in a manner more satisfactory to me than in accommodating you, my dear Hill, to whom I am under so many obligations, and your father, for whom I entertain the highest respect, although I am not acquainted with him. I trust, therefore, that if you should experience the difficulty which I expect you will in finding money to settle the disagreeable concern in which your family is involved, you will let me know it, and I will immediately put my man of business in London in communication with yours, in order to apply it to you. Ever yours most sincerely,

"WELLINGTON."

There is another letter in reply to one from Hill, who had had an application from some common friend for papers for Southey's history of the Peninsular war. The duke had observed the laureate's leaning to the Spanish patriots; who were such objects of admiration thirty or forty years ago to those who knew nothing about them. It also conveys his idea of what a *true* history ought to be.

"London, 25th October, 1821.

"My dear Hill—I have received your letter; and sincerely congratulate you upon the success of your nephew, [in his election,] and this fresh instance of the deserved respect in which you and your family are held in the county of Salop.

"In respect to Mr. Southey, I have heard in the whole that he was writing a history of the war in the Peninsula; but I have never received an application from him, either directly or indirectly, for

information on the subject. If I had received such an application, I would have told him what I have told others, that the subject was too serious to be trifled with; for that if any real authenticated history of that war by an author worthy of writing it were given, it ought to convey to the public the real truth, and ought to show what nations really did when they put themselves in the situation the Spanish and Portuguese nations had placed themselves; and that I would give information and materials to no author who would not undertake to write upon that principle. I think, however, that the period of the war is too near; and the character and reputation of nations, as well as individuals, are too much involved in the description of these questions for me to recommend, or even encourage, any author to write such a history as some, I [fear,] would encourage at the present moment.

"This is my opinion upon the subject in general; and I should have conveyed it to Mr. Southey, if he and his friends had applied to me.

"In respect to your reference to me, I receive it, as everything that comes from you, as a mark of your kind attention to me. Unless you approve of the principle which I have above stated, there is nothing to prevent you from giving Mr. Southey any information you please. But I should wish you not to give him any original papers from me, as that would be, in fact, to involve me in his work without attaining the object which I have in view, which is a *true* history.

"Believe me, ever yours most sincerely,

"WELLINGTON."

From some passages in the volume it would seem that William the Fourth stuck closer by the reform bill than some at the time supposed him to have done, and took upon himself a canvass which rather belonged to the premier, one would think.

"The position of affairs at the period of the reform bill greatly tried him. No slight honor is due to his memory from his own political party, for the way in which he maintained his independence in office at that time. Not only did he remain firm under the difficulties of being opposed to the government, but he was unmoved by the intimation of the king himself, his kind and indulgent master, that his majesty wished him to vote for the bill. 'Sir H. T.,' he says in his memoranda, 'communicated to me H. M.'s wish that I should vote for the second reading of the reform bill. I gave no reply; but said I would consider the subject.'

"When the bill was again brought forward in the house of lords, the following conversation took place between his majesty and Lord Hill. I give it from his lordship's own notes. 'The king sent me a note desiring my attendance at the palace. His majesty, after speaking on the subject of the college, said, the discussion on the reform bill was about to be again brought forward in the house of lords; and that he could not but wish that it should go into committee, which would show the country that the lords were not averse to *some* reform, and might make alterations when in committee. In consequence of what Sir H. Taylor said to me on this subject about a fortnight ago, and from the manner in which the king spoke to me, I felt that he expected me to state my sentiments and intentions. I therefore told his majesty, that on the last occasion I had acted in a way which I understood was satisfactory to him, namely, by not voting at all; that I still entertained the same objection to the bill; and that, according to

my present feelings, I could not vote for the second reading of the bill when it was brought forward again. Such, I assured his majesty, were my conscientious feelings; and I added, that if I were to act contrary to them and to my known declarations, I should so lower myself in the eyes of the world and the army, that I should not be able to render service to his majesty or the country. The king said, he could understand my feelings, and that every one had a right to have his own: he had his. His majesty appeared kind, and not angry, but perhaps was not pleased. On my saying that I wished I had not a seat in parliament as long as I was at the head of the army, he replied, "But as you have one, you cannot give it up, or must attend it," or something to this effect."

Here is another occasion of Hill's opposing royalty.

WHO WAS THIS?

In one of his memoranda there is the following note of an audience with the king, which proves the truth of this assertion, and is most honorable to his lordship's royal master. "In consequence of a letter in the king's own hand this day, respecting _____, I saw his majesty, who said he was positively decided that _____ should be _____: upon which I remarked, that if such were his majesty's commands, they should be obeyed; but, as commanding the army, I felt it my duty to say that it would create great dissatisfaction, and that I entreated his majesty to consider the subject well before he came to such a final conclusion. The king very kindly said, it was my duty to point out to him all objections on the present occasion: he would not press the question." Lord Hill went directly to the officer alluded to, related the whole affair, and added, "I assure you it was all my doing."

MAYORAL MISTAKE.

His good-humored way of taking everything will be seen in a note he sent to the lord mayor and lady mayoress, on their inviting Lord and Lady Hill to a banquet at the mansion-house—"Lord Hill presents his compliments to the Lord Mayor and the Lady Mayoress, and begs to acquaint them that as he has not the good fortune to be married, he cannot have the honor of presenting Lady Hill at the mansion-house on Thursday the 20th inst. Horse Guards, 15th January, 1831."

Waterloo is a well-worn subject, yet always fresh. The following extract from a memorandum by Sir Digby Mackworth, written in the early morning after the action, whilst the rest of the staff were asleep, describes the last charge with more accuracy and reality (notwithstanding a dash of fine writing) than any account we have read. The result of the fire upon the French column is painted more naturally, as working by "wit, not by witchcraft."

"About six o'clock we saw heavy columns of infantry supported by dragoons returning for a fresh attack. It was evident it would be a desperate, and we thought probably a decisive one. Every one felt how much depended on this terrible moment. A black mass of the Grenadiers of the Imperial Guard, with music playing and the great Napoleon at their head, came rolling onward from the farm of La Belle Alliance. With rapid pace they descended. Those spaces in our lines which death had opened and left vacant were covered with bodies of cavalry. The point at which

the enemy aimed was now evident; it was an angle formed by a brigade of guards and the light brigade of Lord Hill's corps. Lord Hill was there in person. The French moved on with arms sloped, *au pas de charge*. They began to ascend the hill. In a few seconds they were within a hundred paces of us; and as yet not a shot had been fired. The awful moment was now at hand. A peal of ten thousand thunders burst at once on their devoted heads. The storm swept them down as a whirlwind which rushes over the ripe corn: they paused—their advance ceased—they commenced firing from the heads of their columns, and attempted to extend their front: but death had already caused too much confusion among them—they crowded instinctively behind each other to avoid a fire which was intolerably dreadful. Still they stood firm—'*la garde meurt, et ne se rend pas.*' For half an hour this horrible butchery continued. At last, seeing all their efforts vain, all their courage useless, deserted by their emperor, who was already frown, unsupported by their comrades who were already beaten, the hitherto invincible old guard gave way, and fled in every direction. One spontaneous and almost painfully animated 'Hurrah!' burst from the victorious ranks of England. The line at once advanced, generals, officers, soldiers, all partaking in one common enthusiasm."

THE NIGHT AFTER WATERLOO.

When the tremendous day was over, Lord Hill and his staff again reoccupied the little cottage they left in the morning. His two gallant brothers, Sir Robert Hill and Colonel Clement Hill, had been removed wounded to Brussels: the party was, nevertheless, nine in number. A soup made by Lord Hill's servant from two fowls was all their refreshment, after hours of desperate fighting without a morsel of food. Lord Hill himself was bruised and full of pain. All night long, the groans and shrieks of sufferers were the chief sounds that met their ears. It was to them all a night of the greatest misery. The men whom the nations of Europe were about to welcome with acclamations, and to entertain in palaces, could only exchange sigh for sigh with each other in a wretched cottage.

EXACT TIME.

In reading the various accounts of this battle, it is curious to observe the discrepancies as to the time it commenced. Lord Hill has, however, settled this point. On arriving in London the autumn after the conflict, he passed his first evening at the house of his friend Lord Teignmouth. "Can you tell me," said Lord Teignmouth, "at what time the action commenced?" Lord Hill replied, "I took two watches into action with me. On consulting my stop-watch after the battle was over, I found that the first gun was fired at ten minutes before twelve."

THE fifteenth meeting of the British Association for the Advancement of Science will be held at Cambridge, commencing on Thursday, 19th June. The time was fixed thus early in order to suit the "Commencement," which brings a large concourse to the university. The great feature of the ensuing session will be a congress of the observers at the different magnetical observatories stationed throughout Europe. Sir John Herschel is the president for the present year.

From the North British Review, [the organ of the Free Church of Scotland.]

Des Sciences Occultes, ou Essai sur la Magie, les Prodiges, et les Miracles. PAR EUSÈBE SALVERTE. Paris, 1839. 2 Vols. 8vo.

THE appearance of a work on the Occult Sciences is almost as great a deviation from the ordinary routine of our literature, as any of the prodigies which it unfolds is from the recognized laws of the material world; and did we not know how little interest is aroused by any volume which bears the proscribed name of science, we should have expressed our surprise that a work so well written, and on a subject so popular and exciting, should have existed for fifteen years without being either translated into our language, or submitted to the processes of criticism or analysis. Had our author been a conjurer who dealt in wonders, he would have gathered round him a numerous and an eager ring; but as a scholar and a philosopher he has attracted few disciples, and in an age oscillating between utilitarianism and frivolity, his genius and learning have failed to command that applause which they so justly deserve.

There are, however, other causes which may account for the indifference with which this work has been received. More familiar with literary than with scientific inquiries, M. Salverte is less successful than he might have been in referring to natural causes the various illusions and prodigies which pass in review before him; and, though we rise from the perusal of his learned and ingenious details with a certain gratification of our curiosity, it is seldom with the conviction that we have obtained a clear and satisfying explanation of the mysteries which they involve. His decisions, indeed, even when he himself confides in them, fail to inspire confidence in the reader; and in discussions of so peculiar a character, where the mind has to pass from the excitement of an apparently supernatural event to the calm repose of a truth in science, we require the prestige of a name to accomplish the transition. Nor is it a defect of a minor kind, or one less injurious to the popularity of the work, that in selecting his materials he has not confined himself to that wide and productive field which constitutes the legitimate domain of the occult philosophy. The records of divine truth are presented to us under the same phase as those of civil history; and the miracles of the Old and New Testament are submitted to as rigorous an analysis as the legends and prodigies of the ancient mythology. This unseemly blending of the sacred with the profane is distasteful even to the less serious inquirer; and the Christian, though he asks no immunity for his creed from the fair scrutiny of human wisdom, would yet desire to throw the veil of faith over its holier events and its deeper mysteries, and protect from an unhallowed paraphrase what transcends reason, and must ever spurn the inquisition of philosophy. M. Salverte was led to study the nature and object of the Occult Sciences as the subject of a chapter in a larger work which he contemplated, on *The History of Civilization from the Earliest Historic Times to the End of the Eighteenth Century*, but his materials accumulated to such a degree that he was induced to give them separately to the world. So early as 1813, the introduction to his principal work appeared at Paris, and in 1817 he published in the *Esprit des*

Journaux for July—a periodical printed at Brussels—the general principles of the work before us, and many of the facts and arguments upon which they rest.*

In tracing the origin and progress of science, we find that the earliest vestiges of knowledge were the cherished possessions of priests and kings; and it was doubtless by their agency that barbarous and untractable communities were first subjected to the restraints and discipline of law. To the ignorant observer of nature everything beyond the range of his daily notice is an object of wonder. The phenomena of the material universe, which have no periodical recurrence, assume the character of supernatural events, and every process in art, and every combination in science, become valuable agents, at first of government and at last of civilization. Thus early did knowledge become power—not what it now is—a physical agent enslaving and controlling the elements for the benefit of man—but a moral sceptre wielded over his crouching mind, acting upon his hopes and his fears, and subjugating him to the will either of a benefactor or a tyrant.

Nor was this sovereignty of a local nature, originating in the ignorance and docility of any particular race, and established by the wisdom and cunning of any individual tyrant. It existed wherever the supremacy of law was established, and was indeed a spurious theocracy, in which the priest and the king appeared as the viceregents of Heaven, displaying as their credentials a series of miracles and prodigies which deceived the senses and overawed the judgment of the vulgar. In this manner did the rod of the conjurer become the sceptre of the king, and the facts and deductions of science his statute-book; and thus did man, the creature of hope and fear, believe, and tremble, and obey.

A system of imposture thus universal in its reception, and having its origin in the strongest principles of our nature, was not likely to suffer any change, either in its form or its character, amid the turbulence of civil broils or the desolations of foreign conquest. Our passion for the marvellous, indeed, and our reliance on supernatural interference, increase with impending danger, and the agitated mind seeks with a keener anxiety to penetrate into the future. Hence is the skill of the sorcerer more eagerly invoked "when coming events are casting their shadows before;" and whether our curiosity be indulged or disappointed, or our fears rebuked or allayed, our faith in the supernatural acquires new intensity by its exercise. Nor were the evils of such a system abated by the advancement of civilization and knowledge. Every discovery in science became a new link in the chain which bound the intellectual slave, and in the moral tariff of antiquity, knowledge was the article of contraband, which, though denied to the people, never failed to find its way into the bonded crypts of the sanctuary. The lights of science were thus placed under a bushel, and skilfully projected from its spectral apertures to dazzle and confound the vulgar.

In this manner did the powers of science and the sanctities of idolatry exercise a long and fatal sway over the nations of the world; and when Christianity had extended itself widely throughout Europe, and had lost the simplicity and purity

* This Memoir is entitled, *Essai sur la Magie, les Prodiges, et les Miracles.*

of its early days, there sprung up from its holiest mysteries a system of imposture hostile to the progress of truth, and not less fatal to the spiritual advancement of man than that which prevailed among heathen nations. Though the instruments of delusion were changed, the system remained the same; truth and fable entered in definite proportions into the legends of the church;—the lying miracles of saints, the incantations of the necromancer, and the presumptuous forgeries of the alchemist, deluded the Christian world for many centuries, and in place of having lost their influence they have been embalmed amid the civilization of modern times. Under this system the spiritual element obtained the ascendancy, and powerful and haughty kings laid their willing necks beneath the feet of the bishop of Rome. But in modern Europe the church has become the slave of the state—the sovereign as its spiritual head has usurped the powers of the Roman pontiff, and in retaliation for the wrong, the humblest depository of episcopal ordination lays claim to a supernatural influence which neither his guilt nor his ignorance can paralyze. The priest of lying oracles, who forged the responses of his God, and the clerical charlatan of the middle ages who pretended to rouse the dead from the recesses of the tomb, were less guilty in their imposture than the educated and unregenerated priest of our own day, who attributes to his unclean hands the renovating influence of the baptismal element, or than the godless bishop who pretends to give the Holy Spirit to some blaspheming and unconverted aspirant.

But it is not among ecclesiastical functions only that this love of the supernatural has arisen with such fearful luxuriance—the pursuits of laymen have been marked with the same extravagances of pretension, and with even a higher demand upon our faith. The Morpheus of the present day, be he the weakest or the wickedest of our race, can distil from his moving fingers the soporific influence, and obtain possession of the mental and corporeal will of his sleeping Alcyone. At his bidding the red current hurries along the stiffened arteries; over the enslaved limbs supervenes the rigor of death; new senses arise; the patient sees where there is no eye, and hears where there is no ear;—nay, he tastes with the palate of his master, moves with his muscles, and thinks with his faculties. Thus have we reproduced the Siamese twins, united, not by a muscular, but by a spiritual ligament. But in this illicit commerce of sensations the magician is subject to an unequal tariff. After he has imparted his tastes and his thoughts to the sleeping partner of the firm, he receives nothing in return; and, so singular is the character of his generosity, that he gives what he does not himself possess, and what he has not even taken from another. The patient discovers the seat and nature of his own diseases, though the sorcerer be no physician; he compounds drugs for their cure, though he be no apothecary; and he predicts future events, though he be no prophet. To these gifts he adds the highest privileges of our suffering nature—an immunity from pain! The executioner might break him on the wheel without the sensation of a strain; and a mesmerized Antonio might give to the Jew his pound of flesh without feeling the inroad upon his skin.

Had such theories stopped here, and occupied merely isolated positions in the intellectual field,

some advantage might have been gained from the antagonism of their errors, and time and reason might have slowly and quietly dialogued them. But they have entered into a fearful covenant, the consequences of which have neither been foreseen by its friends, nor detected by its enemies. The centaur of Phreno-Mesmerism has been its monster offspring, and unless some Theseus, with his Lapithe, shall drive it into exile, *Materialism*, and its kindred heresies, will have a speedy triumph.

Whatever may be the truth of the theory, it is yet consistent with the soul's immateriality, that the mind, acting through material organs, may exercise higher and lower functions in proportion to the form and magnitude of its instruments, and it is equally consistent with the same cardinal truth, that the senses may be quickened, and impeded functions restored during certain states of sleep; but if it be true that the mechanical pressure of a human finger upon an inch of human cuticle, propagated, it may be, through an inch of subjacent bone, and impressed upon an inch of the mental organ—if it be true that such a pressure can excite emotions of piety, and evoke sentiments of devotion, thus summoning into active exercise the noblest functions of the soul, then is that soul but an aggregate of dust—a solid of kneaded clay, which shall die at man's death, and crumble at his decay.

In a country where wonders like these are exhibited to enlightened audiences, and received with faith even by the most sceptical, it may not be uninteresting to take a rapid view of the Occult Sciences of ancient times—to survey the apparently miraculous in nature, and the seemingly supernatural in art—to separate the prodigies which science and ocular evidence have established, from the phantoms which ignorance has created—and to impress upon the young or the unsettled mind the irrefragable truth, that if among the arrangements of the physical world, and under the laws by which Providence directs man's sublunary concerns, there are phenomena and results which transcend our faith and our intelligence, there must be also in the coexisting spiritual world, which is to survive our preparatory state, events and laws which, though they transcend human reason, may yet be established by human testimony, and which, though foolishness to the wise, are yet wisdom to the simple.

After pointing out, in his first chapter, the interest which attaches to the mysteries and magic of the ancients, M. Salverte directs our attention to the motives which give credibility to miraculous recitals. These motives he finds in the number and accordance of the recitals themselves, and in the confidence which we can place in the observers and witnesses, and likewise in the possibility of eliminating what is marvellous by discovering the principal causes which give to a natural fact a supernatural character; and, in the discussion of these topics, instead of exhibiting any sceptical tendency, he evinces an extent of faith which some of our readers may regard as bordering even on the credulous.

"Wherever," says he, "a religious revelation does not overpower the judgment, what motives of credibility can make a judicious mind admit the existence of prodigies or magical works! The doctrine of probabilities will serve for our guide. That a man is deceived by appearances more or less specious, or that he seeks to deceive us if he

has an interest in doing it, is much more probable than the accuracy of a recital which involves in it anything marvellous. But if at different times and in different places several men have seen the same thing or things similar, and if their recitals are numerous and accordant with each other, their improbability diminishes, and may ultimately disappear. Is it credible that, in the year 197 of our era, a shower of quicksilver* fell at Rome in the Forum of Augustus? Dion Cassius did not see it fall, but he saw it immediately after it fell. He collected drops of it, and by rubbing them on a piece of copper, he gave it the appearance of silver, which, he says, it retained three whole days. Notwithstanding his positive testimony, and notwithstanding the tradition reported by Glycas, according to which the same event took place in the reign of Aurelian, this wonder is too strange to be admitted in the present day. Must we therefore absolutely reject it? The impossible, says one, is never probable—surely not; but can we assign the limits of the possible; let us examine—let us doubt—but let us not hasten to deny. At the beginning of the nineteenth century, the most distinguished of the French Savans, a few days after they had rejected, with some severity, an account of a shower of aerolites, (meteoric stones,) were compelled not only to acknowledge the existence but the frequent occurrence of this phenomenon. If a prodigy similar to that witnessed by Dion, had been reported at different epochs by different writers, and if it had occurred in our own day, and had been seen by skilful observers, it would no longer have been a fable—an illusion, but a phenomenon which, like the fall of aerolites, would take its place in the annals where science consigns facts which it has found to be certain, without pretending to explain them.

“With what disdain, with what ridicule and contempt would we have spurned any ancient author who informed us ‘that a woman had a breast in her left thigh with which she suckled her own child and several others.’ This phenomenon was actually maintained to be true by the Academy of Sciences at Paris (at the sitting of the 5th June, 1827.) In order to place the fact beyond a doubt, we require only to know the accuracy of the philosopher who observed it, and the strength of the testimonies by which his veracity is confirmed.”—*Tom. i., p. 11-15.*

In support of the sentiment contained in the preceding extract, that we ought to be cautious in denying the prodigies recorded by the ancients, M. Salverte describes a prodigy in our own day, to which he himself bears a secondary testimony, and which, he avers, would have been treated as a fable had it been related by any ancient author.

“On the 27th May, 1819, at four o’clock in the evening, the commune of Grignoncourt, in the arrondissement of Neufchateau, and department of the Vosges, was desolated by an enormous hail. M. Jacoutot, then and at present (1829) Maire of this commune, collected and melted several hailstones, weighing nearly half a kilogramme (upwards of 1 lb. avoid.) He found in the centre of each a transparent stone of the color of coffee, and from 14 to 18 millimètres thick (from 6 to 8 tenths of an inch!) larger than a piece of two francs, flat, round, polished, and perforated in the

centre, with a hole which would admit the little finger. Wherever the hail had fallen there were found, when it had melted, many similar stones hitherto unknown in the commune of Grignoncourt. In a procès-verbal, addressed to the sub-prefect of Neufchateau, M. Jacoutot mentions this extraordinary phenomenon, and on the 26th September he himself gave to two other persons and to myself the above details, which he offered to have attested by all the inhabitants of the commune, and which M. Garnier, Curé of Chatillon sur Saone and Grignoncourt, spontaneously confirmed to me.

“On the banks of the Ognon, a river which runs at the distance of ten or twelve leagues from Grignoncourt, there is seen a great quantity of stones similar to those which have been mentioned, and equally perforated in the middle. Were they also the product of hail charged with aerolites?”—*Tom. ii., p. 14, 15, Note.*

Now, this story of a shower of transparent coffee-colored stones, embosomed in hail, which is given as an example of an undoubted modern prodigy, is defective in that very condition which M. Salverte considers necessary to command our assent. The phenomena was never seen in any other place, and by any other persons, and the enveloped stone was not a substance, like quicksilver, known to have a separate existence. A meteoric stone might be projected from the moon, however unlikely such a supposition is, or might be a fragment of a broken planet, or it might be an aggregate of mineral elements, which we know exist in the atmosphere; but a great quantity of circular perforated discs of a polished and transparent mineral, could only have come from a jeweller’s shop in the moon, consigned to another jeweller in the atmosphere, who set them in ice for the benefit of the Maire of Grignoncourt. If such quantities of so rare and curious a body not only fell in France, but were gathered on the banks of the Ognon, why did not M. Jacoutot show a single specimen to M. Salverte in 1826, and why do we not find specimens in the different museums in the capital cities of Europe? No mineralogist has described the stone—no chemist has analyzed it, and no devotee has worshipped it.

In the preceding extract, M. Salverte has embodied Mr. Hume’s celebrated argument against miracles, which has so long been the mainstay of the sceptic and the infidel; but though he has himself successfully replied to it, yet he has withdrawn from the benefit of his reply those prodigies and miracles which are witnessed by persons whose judgments are influenced by a “religious revelation,” and consequently the miracles of the New Testament. For this exclusion he has assigned no reason whatever, and it becomes necessary to remove any erroneous impression which it may have made upon the reader.

When we balance the probability that human testimony may err, against the probability that the operations of nature will continue in their ordinary course, we assume an uniformity in these operations of which we have no clear proof, and a fallibility in human testimony which does not universally characterize it. But if there be such an uniformity in the course of nature, and a continuity in her laws, the laws which govern our moral being are no less uniform. That man is often deceived, and is himself as often a deceiver, is a truth too general to be questioned; but it is just as probable, that the earth will stand still, and day and night

* Neither Dion nor Glycas call it quicksilver, but the former drops of dew like silver, and the latter drops of silver.

cease, as that a number of simple and intelligent men will concur in giving false witness when their interests and their happiness would be promoted by withholding it. In discussing a question of this kind, we must take the case of a sober and enlightened inquirer, who is called upon to believe a supernatural event upon the testimony of witnesses with whose character he is acquainted. Such an individual, however learned, can have no very overpowering conviction of the uniform course of nature. Whatever be its extent, it must be founded chiefly on his own limited observation. For anything he can understand, the earth, or any other planet, may stand still periodically, to keep its motions in harmony with the rest of the system; and for anything he knows, such an event may have often taken place. Various facts which history records, and events, perhaps within his own knowledge, may concur in giving some degree of probability to the occurrence of such interruptions of the course of nature. The Aurora Borealis, for example, seems to have presented itself to man for the first time within the last 900 years. The masses of meteoric iron in Siberia and in Brazil, must have fallen from the sky since the formation of the soil on which they rest; and in our own day we have seen pestilence tracking its desolating course over the world, and in lines where neither soil nor climate seem to have drawn it, as if it were a catastrophe in which second causes were either inoperative or concealed from our view.

In the records of human evidence, on the contrary, no examples can be found in which concurrent witnesses persisted in a false testimony, which exposed them to insult and persecution, and finally sealed that testimony with their blood. The sober inquirer after truth, therefore, cannot but regard such a species of evidence as an unerring guide, and by appealing to his own mind—which in a case of this kind must be the safest arbiter—he will find that he could not, under such circumstances, persist in a testimony that was false, and will thus arrive at the same truth which he had deduced from history and observation.

With regard to the limitation which M. Salverte has annexed to the admission of miracles, it does not clearly appear whether the "religious revelation" is supposed to influence the testimony of the witnesses, or the mind of the inquirer. If he means the mind of the inquirer, as the phrase of influencing the judgment might lead us to infer, then the limitation is unnecessary, as no person already convinced of the truth of the revelation, and overpowered by its grandeur, would ever think of inquiring farther into its evidence. If he means the testimony of the witnesses, then it is manifest that the ocular evidence of a believing witness, is, in the abstract, equally good with that of a sceptic, and that evidence, too, is corroborated by the consideration, that a witness who is to regulate his conduct by the truths to which he testifies, and on its account to expose himself to obloquy, if not to exile or martyrdom, will exercise, in the examination of it, a double caution.

In his third chapter, M. Salverte proceeds to enumerate and discuss the principal causes which give to a common fact a supernatural character. The simplest of these causes he finds in the illusory appearances of the works of nature themselves, which the imagination of the observer transforms into realities. The river in the valley

of Mount Ida, which every year ran with blood in commemoration of the death of Memnon, who fell in single combat with Achilles, is an example of this species of illusion. This fragment of Grecian fable originated in the more ancient tradition, that the river Adonis, which had its source in Mount Lebanon, was colored annually with the blood of the unfortunate youth who perished by the mortal bite of the wild boar which he pursued. An inhabitant of Byblos observed, that the soil watered by the river, was composed of a red earth, which being dried by the heat, was carried by the wind into the river, and thus communicated to it the color of blood. Among the poetical fictions of Greece, was the transformation into a rock, near the island of Corfu, of the Phœnician vessel which brought back Ulysses into Thrace. Pliny mentions, that a rock in that locality actually had the appearance of a vessel in full sail, and a modern traveller has described this curious resemblance.* In illustration of this class of illusory phenomena, to which the character of the marvellous has been given, M. Salverte refers to those impressions on the surface of rocks, which so frequently resemble the tracks of living beings. The foot of Buddha is imprinted on Adam's rock in Ceylon, and the impress of Gaudma's foot is revered among the Brhmins. Dr. John Davy conjectures that the one is a work of art, and Colonel Sym regards the other as resembling more a hieroglyphic tablet than a natural phenomenon. The Mussulmans exhibit the impression of Mahomet's head on the walls of a grotto near Medina, and the foot of his camel is sunk in a rock in Palestine. Even in the African desert, in the middle of Soudan, a gigantic impression of the foot of Mahomet's camel, is shown to the traveller. Diodorus Siculus informs us that on a rock near Agrigentum, are to be seen the tracks of the cows which were conducted by Hercules. The legends, however, of Catholic superstition have been more productive than any other, of this species of wonder. The Christian devotee has found on Mount Carmel the mark of the foot of Elias. That of Jesus is repeated four times near his tomb in the vicinity of Nazareth. Near the same village, the Catholic reveres the imprint of the knees of the Virgin Mary, and that of the feet and elbows of our Saviour, and he has even discovered the mark of the last step of the Saviour on earth before his ascension into heaven. Even in modern times, an inhabitant of Charente has recognized upon a rock the impress of the foot of Mary Magdalene;† and the prints of human feet, exquisitely natural, both in their form and position, have been found in our own day in the secondary limestone of the Mississippi valley, near St. Louis. In South America, too, similar human foot-prints, supposed by the Catholics to be those of the apostles, have attracted the attention of geologists.

These various statements, with the exception of the two last, have been adduced by M. Salverte as examples of the influence of the imagination, in seeing the likeness of familiar objects in forms accidentally produced, and he does not seem to be aware of the remarkable discoveries of the foot-steps of animals on solid rocks, which now form some of the most interesting data in geological

* *Bibliothèque Universelle, Littérature, tom. ii., p. 116, June, 1816.*

† *Mém. de la Société des Antiquaires de France, tom. vii., p. 42.*

science.* We have no doubt, therefore, that in several of the cases which have been quoted, the impressions were real and not imaginary, or at least as real as the limestone footsteps near St. Louis. M. Schoolcraft, the American geologist, who describes the latter, informs us that it was the opinion of Governor Cass and himself, formed on the spot, "that these impressions were made at a time when the rock was soft enough to receive them by pressure, and that the marks of the feet are natural and genuine;" and an eminent English geologist, writing on this subject, frankly states that he "is persuaded that the prints alluded to were the genuine impressions of human feet made in the limestone when wet. I cannot now go on," he adds, "with the arguments that may be urged in proof of my assertion, but, rely upon it, those prints are certain evidence that man existed at the epoch of the deposition of that limestone, as that birds lived when the new red sandstone was formed."†

The conversion of the natural into the supernatural, is produced, also, according to our author, by the mere exaggeration of the details or duration of a phenomenon, and hence it may be made to resume the aspect of truth, by restoring to it its natural proportions, or if the miracle has been presented to us as something energetic and permanent, by viewing it as feeble and transitory. The diamond, for example, and some other bodies, after imbibing the brilliant light of the sun, continue for some short time to radiate it in the dark; but the eastern fabulists have illuminated palaces, and lighted up the depths of a forest with their emanations. In like manner, the huge herculean *rocckh* of the same writers, is but the exaggerated *Condor* of America; and the monstrous *Kraken* which the northern mariners sometimes mistake, to their ruin, for an island, is probably but an individual of the cetaceous tribe. The ancients believed that there were some animals which produced their young from the mouth; and there is reason to think that this incredible deviation from the laws of Nature had its origin in the fact, affirmed by Mr. Clinton of New York, that the young of the rattlesnake often take refuge in the mouth of their mother, and of course emerge again when the alarm has ceased. The lake of Avernus, according to ancient authors, exhaled such pestilential vapors, that the birds which flew across it were suffocated in their passage, and long after Augustus had removed its insalubrity by cutting down the adjacent forests, the lake was considered as one of the entrances to the abodes of the dead. The story is doubtless true, and errs only in the duration ascribed to the phenomenon, and in the inference deduced from it. "The marshes of Carolina," says M. Bosc, "are so insalubrious in certain places, surrounded with extensive woods, and during the great heat of the day, that birds, which are not aquatic, are struck dead while passing over it."

A third source of the marvellous presents itself in the use of improper expressions, ambiguous in their nature, and either ill understood or ill translated. In the 2d book of Kings, for example, (chap. vi., v. 25,) we are told that there was a great famine in Samaria, and that it was besieged till the fourth part of a cab of *dove's dung* was sold for five pieces of silver! Now it has been

proved by Bochart, that this name was formerly given, and is now given by the Arabs to a species of peas, vetches, or parched pulse, resembling the dung of the pigeon. It is now a cheap and favorite food in the east, and is generally used when fried, as provisions for a journey. Great magazines of it are collected at Grand Cairo and Damascus. Midas, king of Phrygia, and other ancient princes, are said to have died after drinking the *blood of the bull*, and the death of Themistocles has been ascribed to the same cause, although that blood was never supposed to possess any deleterious property. In eastern temples, however, and also in some of the temples of Greece, the priests possessed the secret of compounding a beverage which had the property of producing sudden death without pain, and to this drink, which had a red color, the name of *bull's blood* seems to have been given.

Using the same metaphorical language, the Swiss have given to a particular kind of red wine the name of the *blood of the Swiss*; and M. Salverte thinks it not unlikely that this virtuous race may, in some future day, be represented as cannibals, when they find it recorded by some of their own historians, that ample libations of this ruddy wine had been quaffed at some of their civic feasts. Ktesias places in India a fountain which is annually filled with liquid gold. "It is emptied," he adds, "every year with an hundred earthen pitchers, which are broken, when the gold is indurated at the bottom, and in each of them is found gold of the value of a talent." This statement of Ktesias is ridiculed by Larcher, the translator of Herodotus, who dwells emphatically on the disproportion of the produce to the capacity of the fountain, which could not contain less than a cubic toise of the liquid. The recital of the historian, however, as M. Salverte justly remarks, is defective only in using the phrase, *liquid gold*, in place of *gold suspended in water*. The individual particles of the metal are not visible in the liquid medium, and it is only by the evaporation of the water, and the gradual subsidence of the heavy particles, that they are precipitated on the bottom and sides of the vessels which contain them.

The other sources of the marvellous assigned by our author, are the use of figurative expressions, and a poetical style—erroneous explanations of emblematical representations—and the adoption of apologues and allegories as real facts. In illustrating these different topics, M. Salverte makes frequent reference to the Old Testament as a record of ancient history, and though we cannot suppose that our readers would derive either pleasure or instruction, by the perusal of this part of the work, or from any brief analysis of it, yet we would recommend it to the notice of the biblical critic, who might draw from it some useful hints both for the exposition and defence of the Scriptures.

From the class of wonders which have their origin in enthusiasm, ignorance, and credulity, M. Salverte passes to the consideration of "real but rare phenomena, which have been extensively received as prodigies due to the intervention of Divine Power." Although our author has scarcely touched upon the subject, the most magical and at the same time the most inexplicable of those phenomena, are the showers of stones which have at different times, and in various places, fallen from the atmosphere. Many examples of these phenomena occurred long before the Christian era,

* See this *Journal*, No. I., p. 30.

† *American Journal of Science*, June, 1838, Vol. xxxiii., p. 268.

and when such phenomena were associated in point of time with political or even with domestic events, they could not fail to be regarded as of a supernatural character, and as indicating the immediate agency of the Almighty. Notwithstanding the distinct accounts that have been handed down to us of the fall of stones, metals, dust and rain of various kinds and colors, they were invariably discredited; and till within the last fifty years, or till the year 1803, when more than 3000 fell at Aigle, some of which weighed seventeen pounds, they excited little notice in the scientific world. The analysis of these stones, which proved them to be different from any other stones which had been found on the surface or in the bowels of the earth, opened the eyes of philosophers; and the subject of aerolites, as they were called, became one of the most interesting departments of modern science. The writings of the ancients were eagerly ransacked, and in these as well as in the records of the early and middle ages of the Christian era, numerous well authenticated examples of this phenomenon were found. In 1478, A. C., a thunder stone fell in Crete. In 1168 a mass of iron fell upon Mount Ida, and the Ancyli or sacred shield, which fell in the reign of Numa, and which had nearly the same shape as meteoric stones which in our own times fell at the Cape and at Agra, has been universally regarded as an aerolite. A large stone, the size of a cart, fell at *Ægopotamos* in A. C. 466, and was publicly exhibited in the time of Plutarch. So frequently, indeed, has this phenomenon occurred, that not a century has elapsed since the birth of Christ, without many examples of it having been recorded. It is singular, however, that so few accidents have attended the descent of aerolites. In 1790, when a shower of stones fell near Roquefort, in the vicinity of Bordeaux, one of them, which was fifteen inches in diameter, forced itself through the roof of a hut, and killed a herdsman and a bullock; and in July, 1810, a huge stone fell at Shahabad in India, which burned five villages, and several men and women.

Other substances, and those sometimes of a very singular character, have been thrown down from our atmosphere. Procopius, and other ancient writers, mention a heavy shower of black dust which fell at Constantinople about the year 472. Showers of red dust, and of matter like coagulated blood, have fallen at various times, sometimes alone, sometimes accompanying meteors, and sometimes along with aerolites. Showers of what has been called by some blood, and by others red rain, have been often recorded, and that so recently as 1803; showers of red snow occurred in various parts of Italy, the coloring matter consisting of silex, alumina, and oxide of iron. The most remarkable of these was the snow of a *rose color*, which fell to the depth of five feet ten inches over the whole surface of Carnia, Cadore, Belluna and Feltri. Snow and hail of a red color, with much red dust and red rain, fell over all Tuscany on the 13th and 14th March, 1813, and a brick-red snow fell on Tonal and other mountains in Italy, on the 15th April, 1816.

Among the prodigies of ancient times, there are none more remarkable than what were considered as *showers of pieces of flesh*. That such substances were found on the surface of the earth, and were, therefore, from their singularity, supposed to have fallen from heaven, there can be little doubt. On the surface of the thermal waters of Baden, and

also on those of Ischia, there has been found a substance called *zoogene*, which resembles the human flesh covered with its skin, and which, when distilled, furnishes the same products as animal matter. M. Gimbernat, who has given an account of it in the *Journal de Pharmacie* for April, 1831, has found rocks covered with it near the chateau of Lepomena, and in the valleys of Sinigaglia and Negropont.

But the meteoric wonders of the ancients, in which the color of blood was imparted to streams of water and showers of rain, have a close parallel in a phenomenon in natural history which has been observed in our own day, and which M. Salverte has mentioned only in a few lines. This phenomenon occurred in the spring of 1825, when the lake of Morat in Switzerland was dyed, as it were, with a red substance, which "colored it in a manner so extraordinary, that all the inhabitants on the banks of the river which issues from it were struck with astonishment." The phenomenon continued from November till April and even May. Early in the day nothing remarkable is noticed in the lake, but afterwards red lines, long, regular, and parallel, are observed along the margin of the lake, and at a little distance from its banks. The substance of these red streaks is pushed by the wind into the small bays, and heaped round the reeds, where it covers the surface of the lake with a fine reddish foam, forming colored streaks, from a greenish black to the most beautiful red. A putrid smell is exhaled during the night from this stagnant mass, and it afterwards disappears, to reappear, in a similar manner, in the following day. The perch and the pike, and other fish in the lake, were tinged red, as if they had been fed with madder; and several small fish, which came to the surface to breathe and to catch flies, died with convulsions in passing through this red matter. The curious phenomenon which we have now described, has been found by M. Decandolle to be enormous quantities of a new animal, which has received the name of *oscillatoria rubescens*, and which seems to be the same with what Haller has described as a *purple conferva* swimming in water. Although this phenomenon did not attract the notice of philosophers till 1825, it is said to happen every spring, and the fishermen announce the fact by saying that the lake is in flower.* M. Ehrenberg, while navigating the Red Sea, observed that the color of its waters was owing to a similar cause.†

In the natural history of our own species, M. Salverte finds many examples of the marvellous, which, though discredited by the sceptical, have been confirmed by modern authors. Some of the more ancient Greek writers, such as Trigoons and Aristæus, speak of pigmies two and a half feet high, of a people who have their eyes in their shoulders—of anthropophagi existing among the Northern Scythians—and of a country named *Albania*, where men are born with white hair, who can scarcely see during the day, but whose vision is perfect at night. Although Aulus Gellius has treated these relations as incredible, yet M. Salverte is of opinion that they are true, that the Laplanders and the Samoiedeans are the types of the two first races, and the *Albinos* of the third. Ktesias places the pigmies in the middle of Asia,

* *Les Mémoires de la Société de Physique et d'Hist. Nat. de Genève*. Tom. iii., part 2; and *Edinburg Journal of Science*, April, 1827. Vol. vi., p. 307.

† *La Revue Encyclopédique*. Tom. xxiii., p. 732.

and these are considered by Salverte to be similar to the *Ainos* of the Kurile Islands, who are only four feet high, and covered with long hair. Our own countryman, Mr. Horner, saw in Boutan an individual of a very diminutive race. "Some ancient authors," says M. Salverte, "have placed the pigmies in Africa.* A French traveller, M. Mollien, found in the Ten da-Maïé, on the banks of the Rio-grandé, a race which, he says, are remarkable for the smallness of their size, and the weakness of their limbs."† Sir Walter Raleigh and Keymis, were informed by the natives of Guiana, that there existed on the American continent a race of men who had their eyes in their shoulders and their mouth in their breast; or, as the French translator of Raleigh's account of Guiana puts it—who had very short necks and very high shoulders. M. Salverte has said nothing of the Patagonians, but we have heard on the authority of a recent traveller, that their apparent size arises from the great height of their shoulders; and if any of our tall male readers will draw himself up so that his head sinks through the room on tiptoe he will not fall short of the Patagonian giants.

M. Salverte has entertained his readers at some length with an account of a few of those monstrous births, which have been so ably classified and described as a branch of natural history by M. Geoffroy de St. Hilaire; but as we do not ourselves take any interest in this department of the marvellous, we shall presume that our readers have the same disrelish for it. The Siamese twins, who have been exhibited in our own times, and in our own country, and who formed the most elegant and interesting specimen of this kind of prodigy, have not even been noticed by our author. Were we to give the wonders of physiology a place among the occult sciences, we should occupy the rest of our space with the most marvellous details. There would pass in review before us:—youths with horns, and men with horny stumps; spotted and piebald negroes, and men who change the color of their skin; boys who recover their speech in a dream, and girls who preach in their sleep; men who lived eighteen years on water, and women fifty years on whey, and others without any drink at all; persons who survived six days without food under snow, and seven days in coal-pits; ladies who talk without tongues, execute difficult pieces of music in their sleep, and who lose and regain their musical ear; Englishmen who live on opium, and Mahomedans who eat corrosive sublimate; soldiers that are slain by the wind of a ball, and sailors who swallow buttons and clasp-knives;

* Aristotle places them among the marshes near the sources of the Nile. Herodotus assigns the same locality to his Troglodytes, and the correctness of this assertion is confirmed by Major, now Sir William Cornwallis Harris, who learned when in Shoa, that a pigmy race, called the Doko, inhabited the extensive wilderness which bounds Caffa on the south. They do not much exceed four feet in height. Both sexes go naked; the men have no beard. They live on roots and ants, which they dig with their unpaired nails. They are ignorant of fire, and have no king, no laws, no arts, no arms; and but a "glimmering idea of a Supreme Being." They are annually hunted by the slave dealers around them, and when surrounded in the bamboo forests, a thousand of the Doko will often surrender to a hundred of their enemies. See Harris' *Highlands of Ethiopia*. Vol. iii., p. 63-67.

† *Voyage dans l'intérieur d'Afrique*. Paris, 1820. Tom. ii., p. 110.

and we should bring up the rear with a heterogeneous array of tiny children that go into pint jugs, and gigantic ones that would fill a barrel; of fat men, and men with but skin and bone; and of giants and dwarfs, terminating with General Tom Thumb. We must leave these subjects, however, in the hands of the physiological conjurer, and restrict ourselves to the more inviting topics of natural magic.

The name *Magic* was given by the Greeks to that science in which they had been instructed by the Magi. In Egypt and in all the countries of the East, it prevailed from the earliest times, and wherever it did prevail, the belief in it was sincere and universal. The power of controlling the laws of nature was believed to reside both in good and evil spirits, and it was never supposed that the exercise of this power by human agency was any encroachment upon what was foreordained, or any interference with the regular and harmonious government of the universe. Every rival sect, however hostile to each other, admitted the power of their respective magicians, and the truth of their miracles; and, though a master spirit either of good or of evil exercised dominion over the rival necromancers, yet a higher power directed the depositaries of supernatural influence, and limited it to its proper bearing upon human affairs. When we see opposing principles come into competition, the inferiority of the evil principle becomes apparent. Zoroaster, who was supposed to be the inventor of magic, did not scruple to contend with the sorcerers of his day; and the superiority of his science, supposed to be the inspiration of the principle of good, never failed to triumph over the ignorance of his antagonists, as the depositaries of an evil influence. Even in the records of Divine Truth, we find the Egyptian magicians contending with the prophet of the true God. Confiding in the wisdom of his sorcerers, Pharaoh sat in judgment over the rival enchantments; but though he at first gloried in the successful miracles of his priests, he at last acknowledged their inferiority to Moses;—and even the magicians themselves, when they saw the genuine display of Divine power, voluntarily cried out that the finger of God was there.

But it was not often that the incantations of human skill, whether wholly acquired by the magician, or communicated to him by some higher power, were brought into collision with the marvellous influence which was given to the prophets. A continued struggle prevailed among the magicians themselves, and he who was the surest prophet, and the most expert wonder-worker, was regarded as the friend and favorite of the gods. The abettors of different religions, and the priests who presided over the temples of rival gods, were thus led to call to their aid all the knowledge, both theoretical and practical, which science could lend them; and thus did the heathen temple become at once the sanctuary of worship and the seat of knowledge.

According to an ancient author, the magic of the Chaldeans consisted of three parts. The *first* part embodied the knowledge of plants, animals, and metals; the *second* indicated the season of the year, and the state of the atmosphere, when marvellous works could be most readily produced; and the *third* was occupied with the details of gestures and cabalistic words, and other mummeries, which were held to be the necessary accompaniments of the magical art. This system of truth

and falsehood combined, varied from age to age, and assumed new forms suited to the character and superstition of the people over whom it was to be wielded. The common arts of life, which were in early times included among its mysteries, gradually diffused themselves among the uninitiated; the truths of science disappeared, while the processes and methods which sprung from them continued in practice; and the tricks of the charlatan, and the deceptions of the juggler became at last the staple commodities of the magician.

After a learned, but not very interesting, discussion of various questions connected with the history and degradation of the ancient mysteries, M. Salverte proceeds in his tenth chapter to enumerate the wonders which the practice of the occult sciences enabled the magician to exhibit, and he gives the following poetical account of the initiation of a youthful aspirant into the awful mysteries of his profession:—

“At first immovable, and, as it were, chained in the midst of darkness as deep as that of the infernal regions, if vivid lightnings pierce the gloom which surrounds him, it is only to display its horrors. By means of their terrific gleams, he sees, and yet cannot discover the monstrous figures and spectres which rise before him. Serpents hiss beside him; wild beasts howl; rocks tumble with a crash, and the echo repeats and prolongs in the distance these alarming sounds. An interval of calm succeeds; and such still is his emotion, that the slightest noise, and the most agreeable sound causes him to start. The scene suddenly brightens, and he sees it changing around him its aspect and its movements; the earth trembles under his feet, sometimes rising as a mountain, and sometimes sinking, as it were, into a deep gulf. He is suddenly lifted up, or quickly carried away, without knowing the impelling power which he obeys. The paintings and statues around him seem endowed with life. The bust of bronze sheds its tears. The colossal figures move and walk, and the statues give forth a harmonious melody. He advances, and centaurs, harpies, gorgons, and hydras with their hundred heads, surround and threaten him, while ghastly forms without bodies, make sport either of his fears or of his courage. Phantoms, having the perfect resemblance of men whom the grave has long concealed—men whom he admired or loved, flit before his eyes, and mock, without ceasing, the embraces which they seem to desire. The thunder growls, the lightnings flash, the waters kindle and roll in torrents of fire. A substance, dry and solid, ferments, melts, and transforms itself into waves of foaming blood! Here the condemned try in vain to fill a shallow urn, but the liquid which they unceasingly pour out, never rises above its level. There the friends of the divinity prove their right to their title by braving boiling water, red-hot iron, melted brass, and burning piles. They make the wildest and most ferocious animals obey them; they give the command, and enormous serpents crawl at their feet; they seize the asp and the viper, and they tear them in pieces, while the reptiles dare not retaliate by their bite. The aspirant now hears the near sound of a human voice. It calls him; he replies to its questions; it issues its orders to him; it pronounces its oracles, and yet everything around him is inanimate, and the nearer he approaches the place whence the words seem to issue, the less he per-

ceives the cause which produces them—the voice by which they reach his ear. At the bottom of a narrow vault, inaccessible to day, a light, as brilliant as that of the sun, suddenly breaks forth, and reveals to him, even in the distance, enchanted gardens, and a palace whose splendor and magnificence mark it as the abode of the immortal gods. There the gods themselves appear to him, and by the most august signs reveal to him their presence. His eye sees them, his ear hears them. His reason disturbed—his mind distracted—his thoughts absorbed by the many marvels, abandon him; and dazzled with the sight, and beside himself—he adores the glorious indications of superhuman power, and the immediate presence of the divinity.”—Tom. i., pp. 268–272.

When the aspirant has thus witnessed many of the most striking wonders, and has shown himself worthy of a place in the priesthood, he is initiated into secrets still more profound, and instructed in processes still more mysterious and sublime. These new powers over man and the elements, are thus eloquently expressed by our author, as if he were himself announcing them to the initiated aspirant:—

“Servant of a God, now beneficent and now avenging, but ever omnipotent—man and the elements shall obey thee. Thou shalt astonish the multitudes by thine abstinence from food; and thou shalt penetrate them with gratitude for rendering salubrious the unwholesome beverage, which an excess of thirst has forced them to accept. Thou shalt unsettle the spirits of men: thou shalt plunge them into animal stupidity, or into ferocious rage, or thou shalt make them forget their griefs; thou shalt rouse even to fanaticism their boldness and their docility; thou shalt fulfil in vision their most ardent desires; and, master of their imaginations, thou shalt often, without any material agent, act upon their senses, and rule over their will. The arbiter of their differences, thou shalt have no occasion, like themselves, to examine witnesses and to balance testimonies—a simple proof will suffice to distinguish the innocent and truth-speaking witness from the guilty person and the perjurer, struck down before thee by a painful and inevitable death. In their maladies, men shall implore thine aid, and at thy voice assistance from above shall heal their diseases. Thou shalt even rescue from death the prey which he has already seized. Woe be to him who shall offend thee. Thou shalt strike the guilty with blindness, with leprosy, and with death; thou shalt prohibit the earth from yielding its fruits; thou shalt poison the air which they breathe; the air, the vapors shall furnish thee with weapons against thine enemies. The most terrible of the elements, fire, shall become thy slave. It shall issue spontaneously at thy command; it shall dazzle the sight of the most incredulous, and water shall not be able to extinguish it. It shall burst forth terrible like thunder against thy victims, and tearing up the bosom of the earth, it shall force it to engulf them, and shall give them up to it to be devoured. The heavens even shall recognize thy power; thou shalt predict, either to gratify or alarm, the changes in the atmosphere, or the convulsions of the earth. Thou shalt turn aside the lightning; thou shalt make sport of its fires; and trembling man shall believe that thou hast the power of bringing it down upon his head.”—Tom. i., p. 272–274.

Such are the powers with which magic has

invested it votaries, and such the influence which it has in every age exercised over ignorance and superstition. To us, however, whom science has enlightened, and over whom a spurious faith has wielded none of its blighting energies, the illusions and deceptions so powerfully emblazoned in the preceding extracts, will appear but as the results of mechanical dexterity and scientific skill, or as the effects of soporific potions which drown the senses without deadening them—of chemical embrocations which protect the skin, or of pungent odors and penetrating liniments which disturb the senses, or act with energy upon the nerves.

In proceeding to show how all these effects have been produced, our author does not pretend to find in the writings of the ancients, positive indications of that scientific knowledge which a satisfactory explanation of them requires; but he believes that the ancients had the means of performing the wonders which they professed to perform, and he therefore supposes that the knowledge which was thus required has gradually disappeared during its transition through the temple worship and the secret societies to which it had been communicated.

In the display of wonders which were exhibited to the sacerdotal aspirant, the motion of the ground on which he stood, and his rapid transference from one scene of the drama to another, were obviously the principal parts of the performance, without which all the rest would have been insufficient; and hence an ingenious and concealed system of mechanical locomotion was required. That such machines actually existed, may be inferred, as M. Salverte has shown, from various passages in ancient authors. Casiodorus defines mechanics as "the science of constructing marvellous machines, the effect of which is to reverse the entire order of nature." Livy informs us, that in the disgraceful mysteries which were denounced by the Roman magistrates in the year 186 before Christ, those who refused to take a part in them were tied to machines, and were said to be hurried off by the gods into secret caves.* The persons who descended into the cave of Trophonius to consult the oracles, were placed at the entrance, which was too narrow to admit a man of the middle size. When his knees were introduced, he felt himself dragged inwards with great rapidity, and in addition to this mechanism, there was another which suddenly enlarged the width of the entrance. When the Indian magi conducted Apollonius into their temples amid a sacred procession, and the chanting of hymns, the earth, which they struck, keeping time, with their batons, moved like an agitated sea, and raised them to the height of two steps, and then replaced them on their former level. That such machinery actually existed, may be inferred also from the present state of some of the ancient temples, where grooves and apertures, and other indications of mechanism are still to be seen.

Ingenious, however, as these pieces of scenic mechanism must have been, they sink into insignificance when compared with the machinery of the present day, contemplated either in the vastness of its power, or in the ingenuity and delicacy of its applications: The mighty steam engine—

whether we view it in its individual grandeur or in its universal dominion over all inferior machinery—must ever be the great autocrat of the mechanical world. How wide are its provinces—how extensive its fields of enterprise—how numerous its subjects, and how diversified their aims! Over the ocean and the estuary, across the inland sea and the mountain lake, along the sinuous river and the placid stream, it passes in majestic sweep like the vapor-tailed comet athwart the planetary domains, dispensing blessings in its course, and gifts yet unrecognized by the recipients of its bounty. The merchant and the traveller, the naturalist and the voluntary exile, the philanthropist and the ambassador of heaven, are borne with speed and safety to the scenes of their respective labors. Man meets man, interchanging the works of their hands or the produce of the soil. Antipodes, who have hitherto been planted with foot opposite to foot, now stand in parallel intercourse and craniological proximity. The white man and the black, the serf and the freeman, the liberated slave and his repentant master, commune on each other's sufferings and aspirations, and prepare for that reign of peace which is gradually evolving from the mysterious cloud that now overhangs the nations. Nor are its labors less marvellous and less beneficent within the more limited range of our daily interests and observation. Here it stands at the mine head disembowelling the earth of its treasures—there delivering it from its superfluous waters or depriving it of its deleterious or explosive atmosphere. Here it has its fixed abode in the factory, giving life and motion to the various combinations of art which prepare for our use the necessaries and luxuries of life—there it takes its locomotive flight along our pathways of iron, shortening time and space, and uniting in one brotherhood the most distant and dissevered members of the commonwealth. Wherever, indeed, its throne is reared it exercises a beneficent sovereignty, feeding and clothing man—subjugating the material world to his use, and summoning all his intellectual powers to make new demands upon its liberality, and draw new prizes from its treasure house.

In the budget of wonders which the ancient priests opened to the astounded neophytes, the phenomena of sound performed an effective part. The roars of thunder were supposed to precede the approach of the gods, or to accompany the responses of their oracles. Pliny tells us that the labyrinths of Egypt contained several palaces so constructed that when the doors were opened the loudest peals of thunder were reverberated from its walls. The sweet sounds which at another time ravished the ears of the aspirant, issued from metallic rods or other acoustic instruments placed behind the wainscot of the temple, and, in Salverte's opinion, the sounds of human voices were produced by hydraulic organs, which were well known to the ancients. In the treatise on rivers and mountains, ascribed to Pausanias, we are told that a marvellous stone was placed as a sentinel at the entrance to a treasury, and that robbers were scared away by the trumpet accent which it sent forth. Mineralogy presents us with several stones which have the property of resonance, and it is probable that a stone of this description was so-suspended as to be struck by a metallic projection. when the external door of the treasury was opened. Strong boxes, or safes as they are called, have been made in modern times which,

* *Raptos a diis homines dici, quos machinis illigatos ex conspectu in abditos specus abripiant eos esse, qui sunt conjurare, aut sociari facinoribus noluerint.*—Tit. Liv. Lib. xxxiv., cap. 13.

emitted sounds to alarm their owners when broken into surreptitiously;* and we have seen similar boxes which, when opened by a false key, throw out a battery of cannon and shoot the intruder. The clinkstone indicates by its very name its sonorous qualities. The red granite of the Thebaid in Egypt possesses similar properties, and so musical are the granitic rocks on the banks of the Orinoco that their sounds are ascribed to witchcraft by the natives, while the stones themselves are called by the missionaries *lozas de musica*. Our countryman, Mr. Mawe, informs us that there are large blocks of basalt in Brasil which emit very clear sounds when struck, and hence this property of particular stones has induced the Chinese to employ them in the fabrication of musical instruments. Within the last few years, indeed, an artisan in Keswick has exhibited in many parts of the island a piano entirely composed of slabs of rock, upon which difficult pieces of music are performed.

Among the acoustic wonders of the ancients were the magical effects produced by ventriloquism. Children were made to speak at the moment of their birth, and statues, animals, and trees appropriated the words which issued from the closed lips of the ventriloquist. The apparatus called the *Invisible Girl*—an invention of modern times, in which questions are received and answered by the mouth of a suspended trumpet, belongs to the same class of deceptions. The *speaking heads* of the ancients contained the termination of tubes which communicated with living orators concealed either behind them or at a distance. The speaking head of Orpheus, of such celebrity among the Greeks and Persians, uttered in this manner its oracular responses at Lesbos. The head of the Sage Mimer, which the Scandinavian magician Odin encased in gold, gave forth its responses with all the authority of a divine revelation. Pope Gerbert constructed a speaking head of brass about A. D. 1000; and Albertus Magnus completed another which not only moved but spoke. Lucian informs us that the statue of Esculapius was made to speak by the transmission of a voice from behind, through the gullet of a crane to the mouth of the figure. An examination of the statues found at Alexandria, indicated the same process; and when the wooden head spoke through a speaking trumpet at the court of Charles II., a popish priest, to whose tongue it owed its efficacy, was found concealed in the adjoining apartment.

Our limits will not permit us to do more than mention the vocal powers of the granite statue of Memnon in Egypt. Sir A. Smith, an English traveller, distinctly heard the sounds issuing from it in the morning; and while others ascribe them to the same cause as the sounds in granite rocks, M. Salverte regards them as wholly artificial, and the work of Egyptian priestcraft; and he contrives a complicated apparatus of lenses, levers, and hammers, by which he supposes that the rays of the sun, as the prime mover, produce the marvellous sounds. Akenside, in his *Pleasures of the Imagination*, has also alluded to a mechanism of strings put in motion by the solar beams.

For as old Memnon's image long renowned
By fabling Nilus, to the quivering touch

* M. Salverte states that Louis XV. possessed one of these, and that Napoleon was offered one at Vienna in 1809.

Of Titan's ray, with each repulsive string
Concealing, sounded through the warbling air
Unbidden strains. Book i., p. 109.

But the most celebrated of all the acoustic wonders which the natural world presents to us is the *Jebel Narkous*, or the "Mountain of the Bell," a low sandy hill in the Peninsula of Mount Sinai, in Arabia Petrea, which gives out sounds varying from that of a humming top to thunder, while the sand, either from natural or artificial causes, descends its sloping flanks. It has been described in our own times by M. Seetzen, a German traveller, and also by Mr. Gray of University College, Oxford; but as their descriptions have been already published in different English works* we shall not again refer to them. A more recent traveller, Lieut. Wellstedt† of the Indian navy, who, while surveying a portion of the Red Sea in 1830, visited this celebrated mountain, and with whom we have had an opportunity of conversing upon the subject, has given the following description of its acoustic properties:—

"Jebel Narkous forms one of a ridge of low calcareous hills at a distance of three and a half miles from the beach, to which a sandy plain, extending with a gentle rise to their base, connects them. Its height, about four hundred feet, as well as the material of which it is composed, a light-colored friable sandstone, is about the same as the rest of the chain; but an inclined plain of almost impalpable sand rises at an angle of 40° with the horizon, and is bounded by a semi-circle of rocks, presenting broken, abrupt, and pinnacled forms, and extending to the base of this remarkable hill. Although their shape and arrangement in some respects may be said to resemble a whispering gallery, yet I determined by experiment that their irregular surface renders them but ill adapted to the production of an echo. Seated on a rock at the base of the sloping eminence, I directed one of the Bedowins to ascend, and it was not till he had reached some distance that I perceived the sand in motion rolling down the hill to the depth of a foot. It did not, however, descend in one continued stream, but as the Arab scrambled upwards it spread out laterally, and upwards, until a considerable portion of the surface was in motion. At their commencement the sounds might be compared to the faint strains of an Eolian harp when its strings first catch the breeze; as the sand became more violently agitated by the increased velocity of the descent, the noise more nearly resembled that produced by drawing the moistened fingers over glass. As it reached the base the reverberations attained the loudness of distant thunder, causing the rock on which we were seated to vibrate; and our camels, animals not easily frightened, became so alarmed that it was with difficulty their drivers could restrain them." —Vol. ii., p. 23.

In continuing his observations, Lieutenant Wellstedt remarked that the noise did not issue alike from every part of the hill. The loudest was produced by disturbing the sand on the north side, about twenty feet from the base, and about ten from the rocks which bound it in that direction. The sounds fell quicker on the ear at one time,

* Brewster's *Letters on Natural Magic*, Letter ix.; and the *Edinburgh Journal of Science*, No. xi., p. 53, and No. xiii., p. 51.

† *Travels in Arabia*. Vol. ii., chap. 2, p. 23-26. London, 1833.

and were prolonged at another, apparently depending on the velocity with which the Bedowin descended. The sounds are said to have an inconceivably melancholy effect, and the tradition given by Burckhardt that the bells of the convent were heard here, was often repeated by the Arabs to Lieutenant Wellstedt.

Our author visited the Jebel Narkous on two other occasions. The first time the sounds were barely audible, and rain having fallen before his second visit, the surface of the sand was so consolidated by the moisture that they could not be produced at all. Hence Lieutenant Wellstedt ascribed the gratification of his curiosity at his third visit to the perfect dryness of the sand, and consequently to the larger quantities that rolled down the slope. The same sounds, he found, were produced when the wind was sufficiently high to set the sand in motion. He does not venture to explain this phenomenon; but he rejects without hesitation the generally received opinion, that the effects are originated by this sand falling into cavities, "because sounds thus produced would be dull, and wholly deficient in the vibrations he has noticed."

Sir John Herschel has pronounced the phenomenon of El Narkous, as described by Seezen and Gray, to be a very surprising one, and to him "utterly inexplicable," and we should doubtless have found ourselves in the same dilemma had we not perused the narrative of Lieutenant Wellstedt, and become acquainted with an analogous phenomenon recently observed in our own country by Mr. Hugh Miller.

This able geologist and accurate observer, when visiting, in the course of last summer, the interesting island of Eigg, in the Hebrides, observed that a musical sound was produced while he walked over the white dry sand which forms the sea beach of the island. At each step the sand was driven from his foot-print, and the noise was simultaneous with the scattering of the sand. We have here, therefore, the phenomenon in its simple state, disembarassed from reflecting rocks, from a hard bed beneath, and from cracks and cavities that might be supposed to admit the sand, and indicating as its cause either the accumulated vibrations of the air when struck by the driven sand, or the accumulated sounds occasioned by the mutual impact of the particles of sand against each other. If a musket ball passing through the air emits a whistling note, each individual particle of sand must do the same, however faint be the note which it yields, and the accumulation of these infinitesimal vibrations must constitute an audible sound, varying with the number and velocity of the moving particles. In like manner, if two plates of silex or quartz, which are but large crystals of sand, give out a musical sound when mutually struck, the impact or collision of two minute crystals or particles of sand must do the same, in however inferior a degree, and the union of all these sounds, though singly imperceptible, may constitute the musical notes of the Bell Mountain or the lesser sounds of the trodden sea-beach of Eigg.

The thirteenth chapter of the work before us is devoted to the discussion of those prodigies which are supposed to have been produced by optical combinations. This class of wonders is perhaps the most interesting of any of those which have a purely scientific origin. As the science of optics deals especially with images either of animate or inanimate objects which can be diminished or enlarged, multiplied or inverted, thrown upon

smoke, into the air, or upon the ground, or upon the walls or ceiling of an apartment, it is obvious that the magician may apply these resources in effecting the most extraordinary exhibitions. It is to the eye, rendered sensitive or faithless by fear, or even when in the full possession of its powers of scrutiny and detection, that the spectres and apparitions which form the staple of the supernatural, invariably present themselves. The illusions of the ear we may question; and even those of the taste, the touch, and the smell, may be liable to suspicion; but we never doubt the existence of what stands fully before us, whether it appeals to our individual observation, or to the concurring senses of our associates.

It is universally admitted that the ancients used mirrors of silver, steel, and of speculum metal, composed of copper and tin. It appears from a passage in Pliny, that mirrors of glass were manufactured at Sidon, though we have no reason to believe that they possessed the art of increasing the reflective power of their posterior surface; and therefore they could be used only when a very faint image was required, or when the person or object was highly illuminated. Aulus Gellius has mentioned another kind of mirror which, though it gave distinct images in one place, lost its power of reflection, or rather of forming images, when carried to another place (*aliorum translatum*.) M. Salverte regards this property as either the result of slight of hand, or of "something analogous to the phenomena of polarized light, which ceases to be reflected when it falls at a certain angle upon a reflecting body." The last of these suppositions is clearly inadmissible, and without having recourse to the magician's wand, we may deprive any mirror of its reflective power, by merely breathing upon it, or conveying to it a film of vapor which will disappear quickly or slowly, according to the temperature of the mirror, or the dryness of the atmosphere in which it is placed.

With mirrors and specula for his utensils, the magician is prepared for the most supernatural exhibitions. The ancients had particular places (*Nekyomantion*) specially consecrated to the raising of the dead, and the apparition of their images or shades. These were images either formed on the wall, or any white ground, and were generally dumb representations, unless when the ventriloquist added his science to perfect the illusion. Sometimes they were formed on the wreaths or clouds of smoke which rose from the burning incense. The objects from which these optical pictures were obtained, were either painted likenesses, or busts, or they might be living persons themselves, dressed and painted so as to resemble the god or the hero who was to be summoned from his retreat. In one of these magical abodes, Homer makes Ulysses converse with his friends raised from the dead, and a crowd of apparitions and a frightful noise interrupt the conversation. We are informed by Jamblichus that the gods, when evoked by the magician, appeared among the vapors disengaged from the fire; and when the statue of Hecate was made to laugh amid the smoke of burning incense, it was probably the image of a living person wearing the sorcerer's costume. But even this supposition is not necessary. The resources of the magician might enable him to dispense with his laughing friend: The grave image of the grave statue of Hecate might have been quickly replaced by a laughing

image from a laughing statue of the same personage.

But the same, and even more astonishing effects, might be produced by simpler means. It was stated by Sir David Brewster, at the British Association at York, that the rigid features of a white bust might be made to move and vary their expression, sometimes smiling and sometimes frowning, by moving rapidly in front of the bust a bright light, so as to make the lights and shadows take every possible direction, and various degrees of intensity. Hence, if such a bust is placed before a concave mirror, its image, like that of Hecate, may be made to do more than smile when it is cast upon the smoky wreaths.

The employment of phantasmagoric exhibitions by the ancients is clearly indicated by Damascius, in his account of the manifestation of Osiris by the Alexandrian priests. "There appeared," says he, "on the wall of the temple, a mass of light, which seemed at first very remote. It transformed itself, while contracting its dimensions, into a face evidently divine and supernatural, with a severe aspect, yet blended with gentleness, and extremely beautiful." This is precisely the manner in which the figures of the modern phantasmagoria, produced by mirrors or lenses, rise out of the luminous image, when put out of focus.

The celebrated feat of modern necromancy described by Benvenuto Cellini, in which he himself was an actor, though perplexed with unnecessary and misleading details, was clearly the work of a magic lantern which threw the pictures of gods and demons upon the wreaths of smoke, while the spectators were stupefied or intoxicated with noisome or exciting odors, which increased their liability to deception, if they did not add the phantasms of the imagination to the crowd of apparitions with which they were previously encircled.

Mirrors of a kind different from any of those we have described, and acting upon a different principle, may have been used by the ancients. A mirror of this kind was, about fifteen years ago, sent to India from China, where they were very uncommon. They are said to have been brought by a Dutch ship from Japan several years before, and to have excited general notice. One of these mirrors, which was described to us by George Swinton, Esq., was five inches in diameter, and made of copper and tin. On the back of it there is stamped in relief certain circles with a kind of Grecian border. Its polished face is so convex as to give an image of the human face half its natural size, and when it was made to reflect from that surface the rays of the sun upon a white ground, the image of the circles with the Grecian border, as stamped upon the back, was distinctly seen in the luminous area on the white ground. On the back of another mirror was a dragon, the image of which was, in like manner, reflected from the polished side. This is doubtless a very magical result, and the instrument which produces it might be made a fertile source of deception. There is here no object to be concealed. The elements of deception all lie within the mirror itself, and the apparition requires only a strong light to be evoked. Like the ablest conjurers, the artist has contrived to make the observer deceive himself—the most insurmountable of all kinds of deception. The figures stamped on the back are the source of this self-deception. The picture in the luminous area is not an image of

the figures on the back, and has no connexion with them whatever, excepting in their resemblance. The figures on the back are merely a copy of a concealed picture which is somehow or other formed or impressed in the polished surface which reflects it. The figure of the dragon, for example, may be delineated in shallow lines on the surface of the mirror previous to its being polished; or it may be eaten out by a diluted acid, so as to remove only the smallest portion of the metal. The surface must then be polished upon cloth, which will polish the slightly depressed parts of the metal as highly as the rest, so that the picture of the dragon will be wholly invisible to the eye. A curious example of this may be seen in highly polished gilt buttons, upon which no figure whatever can be seen by the most careful examination, and yet when they are made to reflect the light of the sun or of a candle upon a piece of paper held close to them, they give a beautiful geometrical figure, with ten rays issuing from the centre, and terminating in a luminous rim. If, in place of the sun or candle, we were to use a small bright luminous point, we have no doubt that the figure given by the Chinese mirror and the button would be much more distinct.*

A similar illusion might be produced by drawing a figure with weak gum water upon the surface of a convex mirror. The thin film of gum thus deposited on the outline or details of the figure would not be visible in dispersed daylight, but when made to reflect the rays of the sun, or those of a divergent pencil, would be beautifully displayed by the lines and tints occasioned by the diffraction of light, or the interference of the rays passing through the film with those which pass by it.

In accounting for the enchanted gardens and magnificent palaces, the residence of the gods, which were exhibited during the initiation of his aspirant, M. Salverte supposes that a method similar to that used in the diorama was employed. In this beautiful invention a fine painting, visible only by transmitted light, rises into existence during the disappearance of another on the same canvass, visible only by reflected light. In this manner a cathedral, perfect in all its parts, gradually passes into one destroyed by fire, and the splendid abbey of Notre Dame, at first illuminated by the setting sun, gradually passes through its different phases after sunset, till its interior is illuminated with artificial lights, and the appearance of the moon and the stars completes the midnight representation of the scene.

The *dissolving views*, another beautiful optical combination of the present day, but which was not known when M. Salverte wrote, would have been, or perhaps was, a valuable auxiliary in ancient mysteries. By means of two magic lanterns, in one of which is the summer representation, and in another the winter representation of the same landscape, the one is made to pass into the other with a beauty and effect which it is impossible to describe. The same effect might be produced, though less perfectly, by mirrors, so that the ancients might have effected any metamorphosis they chose by such an apparatus; they might have thus summoned the dead man from his grave, or given to the pallid corpse both life and motion.

Another optical apparatus which we believe has

* See *London and Edinburgh Philosophical Magazine*, Vol. i., p. 438. Dec. 1832.

not yet been made an instrument of imposture, might be made available by the skilful conjuror. Could we alter the focal length of a large concave mirror, we might make the image of a statue or a living object move or walk backwards and forwards in the air, or through a lengthened wreath or a series of contiguous clouds of smoke suited to its reception. Now Buffon has actually taught us how to bend a large flat plate of glass into a concave mirror. He took glass plates two or three feet in diameter, and by means of a screw acting upon a piece of metal in the centre of the plate, he bent it by mechanical pressure into different degrees of concavity. He improved upon this idea by making the glass plate a part of an air-tight drum, and by exhausting the air with an air-pump, the pressure of the atmosphere forced the glass into a concave form. He next proposed to grind the central part of the plate into the shape of a small convex lens,* and in its focus to place a sulphur match, that when the plate was directed to the sun, his rays, concentrated by the lens, would inflame the match, produce an absorption of the air, and consequently a vacuum. In this way Buffon produced mirrors whose shortest focal length was twenty-five feet; but M. Zeiher of St. Petersburg, by adopting a better process, succeeded in bending a Venetian plate of glass, two lines thick and twenty Rhinland inches in diameter, so as to have a focal length of fifteen feet. He did this by placing a bar of iron across the centre of the plate when placed in a ring. The plate was kept in its place by a thin bar of iron stretched across it, and having a female screw in the centre. This thin bar was then pressed against the glass by a screw passing through the centre of the cross bar and working in the female screw. An apparatus similar to that of Buffon has, we understand, been lately constructed by our ingenious countryman Mr. Nasmyth, who produces the vacuum by simply sucking out the air from behind the plate of glass.

But of all the wonders of modern science the art of Photography furnishes us with the most striking. Beyond the violet extremity of the solar spectrum there exist certain invisible rays which, though not appreciable by their incidence on the human retina, have yet the power of exercising a chemical action upon a Daguerreotype plate or upon a sheet of paper rendered sensitive by the Calotype process of Mr. Talbot. If these rays, as suggested by Mr. Talbot, were introduced into a dark apartment so as to fall upon the persons and objects which it contained, the sharpest eye within would descry nothing athwart the thick darkness which surrounded it. But if a camera, furnished with the sensitive retina of an iodised plate, or a sheet of calotype paper, were directed to the party in the room, it would, in a few seconds, take their portraits, record their passions, and reveal their deeds. Were this dark abode the locality of crime, and the shroud of night the cover of the criminal, the blank yet pregnant tablet would surrender to the astonished sage its embosomed phantoms—the murderer and his bleeding victim.

Nor is this the only contribution which the photogenic art has made to natural magic. Professor Moser of Königsberg has discovered that all bodies, even in the dark, throw out invisible rays, and

that these bodies, when placed at a small distance from polished surfaces of all kinds, depict themselves upon such surfaces in forms which remain invisible till they are developed by the human breath, or by the vapors of mercury or iodine. Even if the sun's image is made to pass over a plate of glass, the light tread of its rays will leave behind it an invisible track, which the human breath will instantly reveal. Had the gigantic bird which, in the primæval age, left its footprints upon the now indurated sea beach as a stereotype of its existence and its character—had that bird marched over a surface of glass without leaving any visible trace of its path, and had that surface been exempted from other agencies, the breath of the modern geologist would have revealed, upon the vitreous pavement, the footprint and the stride of the feathered colossus.

But while *visible* objects thus leave behind them invisible phantoms, which may at any time be summoned into view, *invisible* objects may also impress, or leave behind them, visible and persistent images. This portraiture of the unseen and the unknown may be made upon surfaces with which the objects neither are, nor have been, in contact; and even in our very dwellings may this transmigration of forms, like the hand-writing on the wall, surprise or alarm us.

It has been noticed by several observers, and we have more than once seen it, that a plastered ceiling sometimes exhibits upon its surface the forms of the joists by which it is suspended. The plaster immediately beneath the beams dries less quickly than what is between them, and admits more freely into its pores the finely attenuated matter which the occasional smoke of the fireplace conveys. Were the magician, therefore, to construct the ceiling of his closet in the manner best adapted for his purposes, and place on its upper side, in the apartment above, either a skeleton or its imitation, the smoke of his incense, or the wreaths from his hookah, would soon display, on the whitened surface beneath, the hideous osteology which it conceals. By the exhalations thus modelled and fixed, through a physical agency, in which nature herself is the magician, the forms of things secreted might become manifest, and deeds of darkness revealed, which had baffled the most eager search. Had the lady of the Mistletoe-bough concealed herself above such a roof instead of in the "old oaken chest," the mystery of her melancholy fate might have been more quickly revealed.

Our narrow limits will not permit us to dwell on the wonders which the ancient magicians derived from the science of hydrostatics. The magic cup of Tantalus, which he could never drink though the beverage rose to his lips; the fountain in the Island of Andros, which discharged wine for seven days, and water during the rest of the year; the fountain of oil which burst out to welcome the return of Augustus from the Sicilian war; the empty urns which, at the annual feast of Bacchus, filled themselves with wine, to the astonishment of the assembled strangers; the glass tomb of Belus which, after being emptied by Xerxes, would never again be filled; the weeping statues of the ancients, and the weeping virgin of modern times, whose tears were unaccountably stopped by Peter the Great when he discovered the trick; and the perpetual lamps of the ancient temples,—were all the obvious effects of hydrostatical pressure.

The ascending vapor of fluids, as well as their downward tendency, was summoned to the aid of

* It is singular that Buffon did not think of the simpler method of cementing a lens on the centre of the plate.

superstition. Anthemius of Tralles, the architect of Justinian, being desirous to play a trick to the orator Zeno, his neighbor and his enemy, conducted steam in leathern tubes from concealed boilers, and made them pass through the partition wall to beneath the beams which supported the ceiling of Zeno's house. When the cauldrons were made to boil, the ceilings shook as if they had been shaken by an earthquake.* Another example of the application of steam to the purposes of imposture is given by Tollius.† History informs us that on the banks of the Weser *Busteric*, the god of the ancient Teutons sometimes exhibited his displeasure by a clap of thunder which was succeeded by a cloud that filled the sacred precincts. The image of the god was made of metal, and the head, which was hollow, contained an amphora (nine English gallons) of water. Wedges of wood shut up the apertures at the mouth and eyes, while burning coals, artfully placed in a cavity of the head, gradually heated the liquid. In a short time the generated steam forced out the wedges with a loud noise, and then escaped violently in three jets, raising a thick cloud between the god and his astonished worshippers. In the middle ages the monks availed themselves of this invention, and the steam *bust* was put in requisition even before Christian worshippers.

Although Chemistry, as a science, was scarcely known to the ancients, there is reason to believe that they were acquainted with some processes which were made available in their temples. In the middle ages, and in more recent times, when the alchemists formed a powerful community of impostors, the transmutations of chemistry became valuable elements of magic. A process for imitating blood performed high functions even in the Christian temple, and when this pabulum of life was seen to boil upon the altar and in the urn, disasters, both individual and national, were portended. Even in Provence, in the seventeenth century, when a worshipper approached the statue of one of the principal saints, his coagulated blood, contained in a phial supposed to be filled with it, became liquid, and suddenly boiled. Nor has this imposture ceased to be produced in our own times. In Italy it was universally exhibited at a public ceremony, where the blood of St. Januarius, which was said to have been preserved in a dry state for ages, liquified itself spontaneously, and rose and boiled at the top of the vessel which contained it. After the French took possession of Italy, the trick ceased to be performed; but we have been told by a gentleman who has seen it, that it has been again introduced, and is one of the most imposing of the lying miracles of antichristian Rome.‡ M. Salverte informs us that this blood of the saints is made by reddening sulphuric ether with alkanet root, and then saturating the liquid with spermaceti. This preparation will remain fixed at a temperature of 10° cent. above freezing, and melts and boils at 20°, a temperature to which it can be raised by holding the phial for some time in the hand.

In the story of Nessus and Dejanira, M. Sal-

* Agathias, *De rebus gestis Justiniani*. Lib. v., cap. 4.

† Tollius, *Epistola Lincaria*. p. 34.

‡ In confirmation of this, we may state that Mr. Warton, (the celebrated naturalist, who distinguished himself by riding upon a crocodile,) when at Naples, kissed *five times*, in the course of five hours, a bottle containing the solid blood of St. Januarius, and regarded all his adventures as utterly insignificant, when compared with this act of his life!

verte has found another example of the chemical sorcery of the ancients. When Hercules was about to offer sacrifices to Jupiter, he required a dress proper for the occasion. His wife Dejanira sent him a poisoned tunic, which she had received from Nessus, and no sooner had he put it on, than he was seized with the fatal distemper of which he perished. According to Sophocles, this garment had been smeared by Dejanira herself with what has been called *the blood of Nessus*, whom Hercules had slain. Venus gave her a phial of the liquor, instructed her to keep it in the dark, and to rub it over the garment with a flock of wool. When exposed to the sun, this flock of wool took fire, raised a foam upon the stone on which it lay, and was reduced to powder. M. Salverte supposes that it was a phosphuret of sulphur, composed of equal parts of these inflammable bodies, which remains liquid at a temperature of 10° cent., and takes fire at 25°. Thus when Hercules stood before the flaming altar, the heat of the fire and the moisture of the body, may, according to our author, have decomposed the phosphuret, and permitted the dry and caustic phosphoric acid to disorganize the skin and muscles, and finally produce death.

The sciences of electricity and magnetism yielded but a small tribute to the magic of the ancients, and the priestcraft of the middle ages. The art of bringing down lightning from the heavens seems to have been the only electrical charm which they possessed; and, in a very interesting chapter on the subject, M. Salverte has rendered it probable that the ancients defended their buildings from lightning by conductors, and that the Temple of Solomon was thus protected. Under the magnetical knowledge of the ancients, our author is disposed to rank the mariner's compass, which, after Mr. W. Cooke,* he supposes to be the "intelligence," which animated and conducted the Phœnician navy; and he conceives that the arrow which enabled Abaris to traverse the earth by an aerial route, was nothing more than a magnetic needle. But whether we refer the invention of the compass to an early age, or to the Finns in the twelfth century, it is quite certain that the ancients were acquainted with the attractive power of the magnet; and the great miracle of modern times, the suspension of Mahomet's coffin in the air, was more than once performed in the heathen temples. Pliny informs us that Democritus began to build a temple at Alexandria with loadstones, in order to suspend a statue of Arsinoe in the air, but that he did not live to accomplish it. According to Suidas, a brass statue of Cœrops was suspended in the vault of the temple at Alexandria, by means of a strong iron nail in its head. Cassiodorus, without mentioning a magnet, avers that an iron statue of Cupid was suspended in the air in the temple: and Isidore of Seville, without naming the temple, says that there was seen an iron statue suspended in the air by means of a magnet.

That these miracles were the result of imposition, there can be no doubt. A magnet suspending a weight may have been exhibited as a decoy to the ignorant; but the coffins, if they were suspended at all, were suspended with cords or wires, which, by a judicious arrangement of the lights, in reference to the position of the spectator, could be easily rendered invisible. The science of Magnetism, in its present state, and were it even to borrow

* *Enquiry into the Patriarchal and Druidical Religion*. Lond. 1794. p. 2.

from galvanism her stupendous magnets, is incapable of honoring Mahomet with an aerial mausoleum. It is the modern science of Electromagnetism alone that can perform this splendid miracle; and within the spiral coils of its wonder-working helix, we may yet see suspended the bones of Joanna Southcote; or the undecomposed remains of the chief of the Mormonites; or perchance the penance-worn frame of some Puseyite hierarch, who may have appealed to science as a forlorn hope against the Protestant faith.

In the remaining fourteen chapters of the work before us, occupying a little more than the second volume, M. Salverte discusses, with great learning and ingenuity, many interesting subjects, which have not a special connexion with any individual science. We shall endeavor to give our readers a brief and rapid sketch of the most important points which they contain.

The art of breathing fire—of protecting the human skin from the heat of melted metals or red-hot iron, and of rendering wooden buildings proof against fire, seems to have been practised from the earliest ages. Two hundred years before Christ, Eunus established himself as the leader of the insurgent slaves, by breathing fire and smoke from his mouth; and Barchochebas, the ringleader of the revolted Jews in the reign of Hadrian, claimed to be the Messiah from his power of vomiting flames from his mouth. The priestesses of Diana Parasya, in Cappadocia, as Strabo states, commanded public veneration by walking over burning coals; and, according to Pliny, the Hirpi family enjoyed the hereditary property of being incombustible, which they exhibited annually in the temple of Apollo, on Mount Soracte. Pachymerus tells us that he has seen several accused persons prove their innocence by handling red-hot iron; and, in 1065, the monks produced as a witness, in the great church of Angers, an old man who underwent the proof of boiling water, and that, too, as their reverences state, *from the bottom of the boiler, where they had heated the water more than usual!* Sylla could not set fire to the wooden tower raised on the Piræus by Archelaus; and Caesar could not burn the tower of larch, which was doubtless made fire-proof by a solution of alum. The use of certain chemical embrocations—the substitution of the fusible metal of Darcet, which melts at a low heat—and the application of plasters of asbestos to the feet—or of a saturated solution of alum to the skin—were among the arts thus called into use.

The influence of man over the lower animals was, in ancient times, a fruitful source of the marvellous. There were Van Amburghs, male and female, in those days. The influence of valerian upon the cat, of the oils of Rhodium, cummin, and anise-seed upon rats and mice, may serve to give us an idea of what may have been effected on a greater scale. Men condemned to destruction by wild beasts, are said to have protected themselves by the fetid odor of the fat of the elephant, with which they had been smeared; and Firmus is said to have swam with impunity in the midst of crocodiles, by rubbing himself with their grease. In the temple of Jupiter Olympus, there was a bronze horse supposed to have been anointed with the juice of the *hippomanes*, which roused the passions of every horse that approached it; and an analogous property is said to have been possessed by the brazen bull which was the chef-d'œuvre of Myron. The influence of music over

animals, the fascinating power of snakes, and the methods of taming them, by depriving them of their powers of mischief, are all treated by M. Salverte with much detail. The lumbering hippopotamus, and the massive elephant, rejoice in the notes of martial music, and the cat, the lizard, the iguano, the tortoise, and even the spider, are said to be susceptible of the charms of harmonious sounds.

The professors of ancient as well as of modern magic found powerful auxiliaries in the soporific drugs, and poisonous beverages which derange the intellectual as well as the physical condition of man. The waters of Lethe, and the beverage of Mnemosyne, which killed Timochares in three months after he had quaffed it in the cave of Trophonius, are examples of the soporific and stupefying drinks of the ancients. The *Nepenthes* of Homer, the *Hyoscyamus datura*, the *Solanum*, the *Potomantis*, the *Gelatophyllis*, and the *Achaemenis* of Pliny, the *Ophiusia* of the Ethiopians, and the *Muchamore* of Kamschatka, were all the instruments of physical and intellectual degradation. Carver informs us, that a bean is thrown into the mouths of the religious fanatics, and that the insensibility and convulsions which it occasions terminate only with its rejection from the stomach. The Old Man of the Mountain, in the time of the Crusades, is said to have enchanted his youthful followers by narcotic and exhilarating draughts. The Hindoo widow is supposed to ascend the funeral pile, physically as well as morally fortified against pain. The victims of the Inquisition similarly prepared, are said to have frequently slept in the midst of their torments; and M. Taboureaux assures us that the merciful jailors made their prisoners swallow soap dissolved in water, (the vehicle, doubtless, of more powerful medicaments,) to enable them to bear the agonies of the torture.

It would be difficult to study the history of imposture, whether founded on the miracles of nature or the devices of art, without learning, if we wish to learn, an important lesson. As the mere occupant of a terrestrial paradise, man cannot but appreciate the noble provision which has been made for his wants and his pleasures, and admire the beneficent arrangements which have superadded the refinements of domestic and social life. In his dominion over the animal world, he wields the sceptre of a king; and in the freedom of his range over "a thousand hills," the beauty and grandeur of nature hallow with their finer sensations the rude activity of his lot. From day to day is repeated the mysterious round of life and motion, and were he thus to live and die but in the exercise of his physical powers, the very source and purposes of his being would be the deepest mystery. But when he recognizes within himself the germ of intellectual life, the spiritual element which no chain can bind, and nothing sublunary satisfy, the mystery of his existence is wrapped up in the higher mystery of his fate, and life here and life hereafter combine their mysterious relations but to perplex and alarm him. Mysteriously ushered into life—imbibing mysteries in his earliest lessons—encountering them in his studies—and checked by them in his aspirations—he is yet unreasonable enough to expect that they will be cleared away from the only subject with which they are inseparably combined. We believe that races of animals, anterior to man, have been buried and embalmed in the solid rock beneath us,

and yet we know not why they lived, and by what catastrophe they perished. We believe that a deluge has swept over the earth with its desolating surge, destroying life, and moulding into new forms the hills and valleys which it covered; and yet we cannot discover whence its waters came, and what was their commission. We believe that masses of rock and stone have fallen from the heavens; and yet their source and their errand are equally unknown. But though cherishing even such mysterious convictions, we yet startle at the belief that the Creator of man has revealed to him his will, and that the Sovereign, whose subjects have rebelled, has sent a deliverer to their rescue. If the fulness of knowledge has gradually developed to our understanding the wonders of creation, the fulness of time will as certainly unfold the mysterious arrangements of Providence.

Nor is the power of the marvellous, as an instrument of government, less instructive than the comparison of what the sceptic rejects with what reason compels him to believe. Over our brightest hours there hangs a mysterious cloud, veiling or eclipsing the future, while it casts over the present a sombre and a fitful light. The worldly man seeks to dispel it, and the wise man to pierce it; but, however viewed, it is unceasingly before us, and the spiritual world, like our planet in her darkest eclipse, is still seen in shadowy outline, displaying its mountain tops and its caverns. And though "from that distant bourne no traveller has returned," we yet people it with the beings of our affections, and feeling as if, beneath their eye, and under their care, we willingly surrender ourselves to an influence invisible and undefined. Active at all times and in every place, this reverential fear finds a residence in every bosom. It is the homage of a created spirit to its Master—the becoming awe of a fallen and derived intelligence. Can we wonder, then, that minds thus constituted have, in every age, been slaves to the marvellous, and the easy dupes of every species of imposture that claimed an alliance with the world of spirits? The greater our own veracity the less do we suspect that of others, and the more willingly do we surrender our own judgment to that of our superiors in genius and knowledge. The rising doubt is speedily checked by the display of what, to such minds, must appear supernatural; and the positive possession of powers more than human is easily vindicated by those who have been initiated into the mysteries of science, and have discovered the easiest avenues to the uninstructed mind. So overpowering, indeed, is this kind of influence, and so irresistible is its appeal to the evidence of our senses, that the most accomplished and the least credulous individuals have surrendered themselves at its call.

But though the cunning priest and the needy conjurer still ply their work, yet the reform in religious worship, and the increasing intelligence of the age, have narrowed the magician's sphere, and paralyzed his influence. In place of being a tributary to imposture, knowledge has become its foe. Its empire of power, indeed, has ceased, but its empire of civilization has begun. It no longer governs but guides mankind. Formerly their oppressor, it is now their friend—once the chain which bound them to the earth, now it is "the wing on which they rise to heaven."

The transition from the supremacy of knowledge to the decline of its power, and from ecclesiastical to civil rule, is one of the most extraordinary phases of modern times. As science has become more valuable to the state, she has, in the same proportion, sunk in influence and esteem; and as religion has become more pure and simple, she has, even in a higher ratio, been shorn of her inherent and inalienable rights. An oligarchy of wealth has replaced the nobler oligarchy of knowledge, and a conclave of statesmen has usurped the hierarchy of the church. To compensate for misgovernment, or to quell turbulence, or, perchance, to purchase a temporary quiet, error, intellectually debasing and spiritually fatal, is about to be fostered and endowed, and that system of faith which claims a sovereignty over things temporal as well as eternal, is to be sustained by those very men who have denied to a Protestant church its spiritual jurisdiction, and whose hands are yet scarred with its destruction. If, in their thirst for power, hostile factions shall combine in support of an idolatrous creed, while Protestant truth enjoys but a partial toleration, it is time that the host of evangelism should be marshalled for the combat. The shadow of the coming conflict is already cast before us: Revelation has predicted the collision, and woe be to those who are blind to its indications, or who shrink from the stern duties which they impose.

A CURIOUS engineering project has been described recently before one of the railway committees. To secure a rapid communication with Ireland, it is thought desirable to continue the North Wales Railway across the Menai Straits to Holyhead. The existing suspension-bridge is too weak to bear the railway trains, and the erection of a stone bridge is deemed impracticable. In these circumstances, it is proposed to extend an iron tube or gallery across that arm of the sea, which, from the top of the one bank to that of the other, is 900 feet broad. There is a rock in the middle of the water which divides the space into two. The tube will, therefore, be in two lengths of 450 feet, built like an iron ship of strong plates fastened by rivets, and perhaps strengthened by longitudinal ribs of iron. Its section is to be twenty-five feet in height and fifteen in width. It seems to be thought that the tube will maintain a nearly horizontal position by its rigidity, at a height above the water sufficient to allow masted ships to pass; and that too, while it is loaded with a railway train, weighing sixty or eighty tons.

An immense brass mortar, brought from China by the Cornwallis, has arrived at Woolwich. It weighs eight tons seventeen hundred weight, having a diameter of bore of two feet three inches, and a chamber of twenty inches; the depth of the whole being about five feet. The mortar was found in the bush in China, and partly concealed under ground. It is composed of apparently very fine metal; and the trunions being corroded to a considerable extent, afford evidence that the mortar is of great age. It appears also as if the part where the vent is, which is very perfect and little worn, had been cast again, and inserted in its present position. Some guns recently made for Mehemet Ali in this country, with a bore of only fifteen inches diameter, took shot weighing 400 pounds.

From Chambers' Journal.

CAPABILITIES.

It has often been a question whether great men are the producers or the produced of great crises. We see a Cromwell live for forty years a quiet country-town life, till at length a national convulsion arising, he, being strongly interested in the views of one of the parties, dashes forward, and, before passing fifty, has all but the crown of England upon his head. Again, we see a French sous-lieutenant of artillery plunging into his country's history at a time of similar confusion, and making himself the most formidable sovereign upon earth before he is thirty-five. If we were to limit our regard to such facts as these, we should be disposed at once to conclude, that a man of powerful character is nothing, unless an opportunity arise for his entering upon a grand career. But, on the other hand, we often see a powerful mind arise in times comparatively tranquil, and work great marvels, apparently by its own inherent energies. We see at times what seem to be occasions for the coming forward of great men upon the stage, and yet they do not come. We then begin to think that perhaps a Cromwell or a Bonaparte contributes to some great, though indefinite extent, in producing the events to which his appearance at first seemed subordinate. We suspect that the civil wars of England, and the French revolution, would not have taken the turn they did, but for the potent and overmastering influence of these individual actors. Thus we are prevented from coming to a decision on the point. And, in fact, this is a question which stands unsettled amongst thinking men until the present hour.

The question, as it appears to me, can never be definitely settled on one side or the other; for neither view is wholly true. But I believe that the truth preponderates in favor of the argument which considers men as requiring circumstances to evoke their mental powers. Strong, active, and original minds will ever tell to some degree upon their circumstances, be these as impossible as they may; but they cannot tell to a great degree, unless at a time when the social elements are in some confusion. And this is simply because, let a single mind be ever so powerful, the fabric of society and its conventionalities is, in ordinary circumstances, stronger still, so that no one can do more than merely modify it in some slight degree, or prepare the way for future operations whereby it may be affected. If the matter be narrowly examined, it will always be found that, where an occasion for the appearance of a great leader passed over without any one coming forward, the necessary stir of the social elements was wanting. The *vis inertia* of the mass is what all single minds find fatal to them, when they attempt to do great things with their fellow-creatures. Hence a Luther, rising in the twelfth century, when the Romish church was at its highest pitch of power, would have only broken his head against its walls. As an obscure heretic, his name would have been forgotten in a few years. Such minds as his must, in the course of nature, have arisen at various periods among the conventual brotherhoods; but they would never become distinguished for more than a somewhat latitudinarian way of dealing with the authority of the prior, or perhaps an occasional fractiousness at the elections of sacristans. It is like the wind-sown seed, much of

which comes to nothing because it lights in stony places, while only what chances to fall on good ground fructifies. And there is another thing to be considered. The most powerful minds are more or less dependent upon things external to them, in order to be roused into due activity. Such a mind droops like the banner by the flag-staff, till the wind of occasion unfurls it. It may pine, and chafe, and wear itself out in vain regrets and ennui, like the prisoned huntsman, or, in the desperation of forced idleness, or unworthy occupation, waste itself upon frivolities idler than idleness itself. But still it will be for the most part a lost mind, unless circumstances shall arise capable of raising it to its full force, and eliciting all its powers. Here a consideration occurs, calling for some collateral remark. We are apt, at a tranquil period, to pity the men who have to fight through civil broils such as those in which Spain has for some years been engaged. In reality, these men are happier than we think them. They have the pleasure of feeling their faculties continually at the full stretch. Victorious or defeated, hunting or hunted, they are thoroughly engaged in the passing day; not a moment for the torture of excessive ease. Providence is kind to the men who undertake dangerous enterprises. Even when death comes to them—no matter how dreadful his shape—he is met in a paroxysm of mental activity, which entirely disarms him of his terrors.

It follows from these considerations, that there must, at all but extraordinary times, be a vast amount of latent capability in society. Gray's musings on the Cromwells and Miltons of the village are a truth, though extremely stated. Men of all conditions do grow and die in obscurity, who, in suitable circumstances, might have attained to the temple which shines afar. The hearts of Roman mothers beat an unnoted lifetime in dim parlors. Souls of fire miss their hour, and languish into ashes. Is not this conformable to what all men feel in their own case? Who is there that has not thought, over and over again, what else he could have done, what else he could have been? Vanity, indeed, may fool us here, and self-tenderness be too ready to look upon the misspending of years as anything but our own fault. Let us look, then, to each other. Does almost any one that we know appear to do or to be all that he might? How far from it! Regard for a moment the manner in which a vast proportion of those who, from independency of fortune and from education, are able to do most good in the world, spend their time, and say if there be not an immense proportion of the capability of mankind undeveloped. The fact is, the bond of union among men is also the bond of restraint. We are committed not to alarm or distress each other by extraordinary displays of intellect or emotion. There are more hostages to fortune that we shall not do anything great, than those which having children constitutes. Many struggle for a while against the repressive influences, but at length yield to the powerful temptations to nonentity. The social despotism presents the fêtes with which it seeks to solace and beguile its victims; and he who began to put on his armor for the righting of many wrongs, is soon content to smile with those who smile. Thus daily do generations ripe and rot, life unenjoyed, the great mission unperformed. Do angels ever weep? If they do, what a subject for their tears in the multitude of young souls who

come in the first faith of nature to grapple at the good, the true, the beautiful, but are instantly thrown back, helpless and mute, into the limbo of commonplace. Oh conventionality, quiet may be thy fireside hours, smooth thy pillowed thoughts; but at what a sacrifice of the right and the generous, of the best that breathes and pants in our nature, is thy peace purchased!

Is not one great cause of the dissatisfaction which rests on the close of most lives just this sense of having all the time made no right or full use of the faculties bestowed upon us? The inner and the true man pent up, concealed from every eye, or only giving occasional glimpses of itself in whimsical tastes and oddities—uneasy movements of undeveloped tendency—we walk through a masque called life, acting up to a character which we have adopted, or which has been imposed upon us, doing nothing from the heart, "going" our best thoughts to make them lie still. Piteable parade! The end comes, and finds us despairing over precious years lost beyond recovery, and which, were they recovered, we would again lose. And, if such be a common case, can we wonder at the slow advance of public or national improvement? There must be a design with regard to highly-endowed natures, that they are to bear upon all around them with such intellectual and moral force as they possess, and thus be continually working on for the general good. This we might consider as a sort of pabulum requisite for the public health—something analogous to air or food with respect to the bodily system. But is this moral necessary of life diffused as it ought to be? Let the endless misdirections and repressions of human capability answer the question.

From the Tribune.

SATURDAY NIGHT THOUGHTS.

BY MRS. E. J. EAMES.

THE six days' work is done.
The harsh realities, the tough turmoils,
The close consuming cares, the tasking toils
That hang around one's feet in cankering coils—
Their weekly course is run.

Sit thou in Sabbath peace;
Compose thy weary limbs in languor sweet;
Fold thy tired hands and rest thy faltering feet—
O, gratefully this mortal frame will greet
From care a short release.

Wipe from thy dusty brow
"Careful and troubled about many things;"
Unloose the cumbrous house-work robe which
clings
So closely that the struggling spirit-wings
Hang heavily and low.

Still on thee, on thee yet
The spirit of despondency is strong;
Still crowding cares unto thy lot belong;
Still must thou strive with outward ill and wrong,
And many a vain regret.

O, hurried life of mine!
How "few and far between" thy dreaming hours!
How shouldst thou turn aside to gather flowers
From faery-land, when on thy human bowers
The sun forgets to shine!

My yearning, yearning heart!
Is this intense aspiring to be free

A happy or a mournful thing for thee?
For, O! it hath but little harmony
With earthly lot and part.

Yes, there is pain in this
Most passionate longing to o'erreach the clay—
This exile-thirst which stronger grows each day
To take the morning-wings and flee away
To realms of purer bliss.

And yet, not all in vain!
Do not these cravings in the haunted breast
Whisper the soul, "Lo, this is not your rest;
A new existence, in a home more blest,
Is yours to gain!"

A home of such deep peace
As eye ne'er saw, nor hath it entered e'er
Man's heart to dream of that celestial sphere
Where God's own hand shall wipe away each
tear
And bid all sorrows cease!

Then strive, O, still strive thou
To keep, amid life's weary wearing din,
Polished and pure the immortal gem within—
So thou ere long that perfect rest shall win
Unrealized below.

And now o'erwheeled one,
With thy last waking thoughts give thanks to
Heaven
That to earth's toiling children He has given
A holy pause from care—that this seventh even
Findeth thy labors done.

Ask Him to lift thy heart
With all its human yearnings from the dust;
To strengthen thy weak soul, and fix its trust
Firmly on Him—and with the perfect just
Give thee thy better part!

PARAGUAY.—A letter which we have seen states that, on a stranger presenting himself at the frontiers, numerous interrogations are made as to his occupation, religion, and opinions. He is expressly told that he must neither speak of the form of his own government, nor make any remarks upon that which he finds established, and that if he indulge in any conversation that can be considered political, he will be sent out of the country under an escort of Indians. One of the singular circumstances attendant upon the dictator's death, has been the marriage of a large portion of the population previously living together on very equivocal terms. During his life no one was permitted to marry without his special permission, which was not very easily obtained. Fathers, mothers, sons, daughters, grandsons, granddaughters, nay even the fourth generation, as the female is marriageable at the age of twelve, have availed themselves on the same day of the benediction of the priest, and the holy bonds of wedlock have been entered into by whole villages. The society at Assumption is described as singular, in consequence of the severity with which ladies were treated who decked themselves with much finery. Their dress is formed of one single large vestment, with a belt round the waist. At the tertullas, after dancing, as the houses are scarcely furnished, it is usual for the lady to seat herself on her partner's knee; but no inference is to be drawn from this that the morals are more lax than in other countries; custom and habit reconcile us to strange circumstances.—*PolYTECHNIC.*

CORRESPONDENCE.

ONE of the most important matters in the education of the American people, is a proper selection of the works of British writers, for republication in this country. A great publishing house which should be guided by good taste and sound principle in this business, would perform an invaluable public service. We have often mourned over the want of discrimination which our publishers have shown, and regretted that there should be no apparent sense of the responsibility which is incurred by those who introduce to our families these *silent friends*, which are to have so much effect upon them, for good or for evil.

With these feelings, we think it our duty to do what we can to bring before our readers again, a course of books which is superintended by a gentleman who has given already good proof of his fitness for the task, so far as good sense and good taste are concerned. It does not appear that anything further is intended in this course than to supply choice amusement, and to cultivate a refined taste for literature.

The following notice is copied from the *New York Evening Post*; and since it was written we have received another number—*The Dramatic Literature of the Age of Elizabeth*, by William Hazlitt.

WILEY AND PUTNAM'S LIBRARY OF CHOICE LITERATURE.—We infer from the regularity with which this series of works is issued, that the tasteful enterprise of the publishers is generally sustained by the community. The plan of this library is admirably adapted to the times, as well as to the higher demands of readers. It combines economy with elegance, and convenience with sterling value. The volumes are beautifully printed and bound in paper covers—a mode long prevalent in France, which renders books more portable, and, at the same time, leaves purchasers

at liberty to adopt any style of binding they may choose. As to price, that of each number varies from two to four shillings; and this outlay, be it remembered, is not for flimsy romances which once perused are thrown aside forever, but for literature, in the genuine meaning of the term, "books which are books"—as the motto of the Library sets forth, that once read become friends, and will be again and again resorted to for information and refreshment. Thus far the series has been admirable, and we only hope a similar felicity of judgment will attend all future selections. In the first place we had Eöthen, decidedly the most brilliant volume of Eastern travels recently produced. Indeed, we know of no similar work to compare with it except Anastasius.

It is graphic, witty, scholar-like and poetical, free from egotism, yet full of individuality—in a word, the genial commentary of a man of education, refinement and enthusiasm, as he wandered over that mysterious region so eloquent in all its associations, alike to Christian, poet and philosopher. Of the Amber Witch and Undine, it is unnecessary to speak. Each had taken its rank as a standard exemplar of its class, before the present elegant reprints. These were much wanted, as the existing editions were either disposed of or executed in a manner that rendered them unworthy of preservation. Leigh Hunt's *Imagination* and *Fancy* followed next. This is one of those delightful productions of which we can never weary. It is a poet's talk of his own art and its great professors.

The effect of such reading is like that of the best society, awakening and satisfactory. In this volume are collected some of the choicest gems from the whole range of English poetry—interspersed with delicious criticism, anecdote, speculation and glowing commentary. Hunt is one of the most spontaneous and cordial writers of the day. He makes us relish anew the good things both of literature and life by his own sincere and hearty appreciation of them. He can be sensible without losing his cheerfulness, and exhibit very positive tastes without a particle of dogmatism.

We are gratified to perceive that his "Indicator" and "Seer" will be republished in the Library.

American readers who have yet to make the acquaintance of these delightful essays, have a rare treat in prospect. They will find them the most agreeable papers that have appeared, in their peculiar vein, since the days of Steele; and acknowledge that the author fully redeems the promise of his title-page and gives us "Common Places Refreshed."

"Lady Willoughby's Diary" has charmed every one for its simplicity, quaintness and nature. It represents, with a truly Flemish fidelity, the two extremes of public and private life, of civil war and domestic seclusion; the thoughts of a true woman absorbed in her home duties, and the cares of a statesman involved in the turmoil of political dissensions. We have read of the times portrayed both in novels and histories, but the glimpse afforded by the unpretending pages of this little diary, has brought us infinitely nearer the scenes and the persons of that extraordinary era, by intimately associating them with the person and feelings of an affectionate and pious woman, such as we have known and loved. Such books make us familiar with the past, not merely cognizant of it. There is the same difference between them and statelier records, as between Macready's Coriolanus and Placide's Grandfather Whitehead.

Another capital feature in this series of books, is the bringing out of Hazlitt's writings in a style such as their merits deserve. William Hazlitt possessed one of the acutest minds of his day. He lived upon literature and art. He was one of those men who seem born to make others appreciate genius. His perceptions were singularly keen and observant, and his powers of reflection of a high order. In many respects he is an excellent guide to truth, setting an example by his vigorous independence of thought, his earnestness of sympathy, and refined definitions of artistic excellence and personal character. At the same time he was a man of strong prejudices and perverted feelings. He is not to be implicitly followed, but to be read with constant discrimination. In his "Table-Talk," which forms two numbers of the "Library," there are innumerable attractive reminiscences of books and men, and suggestions of rare value both for the writer, the artist and the man who desires to improve the advantages which nature bestows. We know of few writers who, with all his defects, are so *alive* as Hazlitt. He had that mental activity which is contagious, and has done no little good by setting minds of more equanimity upon the track of progress. It appears this collection of essays is to be followed by his other works. They will be a valuable accession to the current literature of the day.

It is obvious, from this hasty survey, that there are two particulars in which these books deserve the name of "Choice Literature;" and which honorably distinguish them from the mass of reprints that has deluged the land with cheap reading. They contain ideas, and they have a style. The former will furnish the hungry mind, and the latter will refine the crude taste, so that an actual benefit, independent of the diversion attending such reading, will certainly accrue. We have dwelt at unusual length upon this series of books, because we regard their appearance and popularity as the best sign of the times, as far as literature is concerned, which we can now discern.

The apathy of our publishers, in regard to all compositions offered them, except fiction, and that of the most vapid kind; the apparent success of the cheap system, and the "angels' visits" of works of real merit, seemed to indicate a fatal lapse of wholesome taste.

The "Library of Choice Literature" was started on a different principle. It appealed to good sense and the love of beauty, rather than to a morbid appetite for excitement. We therefore regard the favorable reception it has met with, as evidence that the public, in the end, will, after trying all things, hold fast that which is good. We shall look for the American series, advertised by the publishers, with great interest. While we have criticism like that which occasionally redeems our periodical literature, such a prose poet as Hawthorne, such a speculative essayist as Emerson, such a brilliant tale writer as Willis, to say nothing of adepts in other departments, surely there is no difficulty in making a very respectable American Library of Choice Literature.

"THE CRESCENT AND THE CROSS; OR, ROMANCES AND REALITIES OF EASTERN TRAVEL," by Elisha Warburton, is the name of the book which makes its appearance to-day in this series. We have already given some extracts, and propose hereafter to give more. It is a book which, we foresee, the public will devour eagerly first, and hear what the critics have got to say afterwards. No one who takes up the Crescent and the Cross can readily lay it down. It runs over with enthusiasm, and is brilliant and sparkling on every page. It will be another decided hit for "the series." Mr. Warburton's book embraces a wider field of observation than Eöthen, to which it bears a striking resemblance in style and execution. We think it, indeed, a more valuable book than Eöthen, not so brilliant, but more accurate and instructive.

From the same publishers we have received No. 6 of the AMERICAN REVIEW; a whig journal of Politics, Literature, Art and Science.

BOOKS RECEIVED.

Nos. 3 and 4 of DR. LARDNER'S LECTURES ON SCIENCE AND ART, have been published by Messrs. Greely & McElrath, New York. Subjects: The Tides; Light; The Major Planets; Reflection of Light; Prospects of Steam Navigation; The Barometer; The Moon; Heat; Atlantic Steam Question; Galvanism. We cannot too often recommend this work to our readers of all ages; but it is especially important for young people to have a general, even if it be a superficial knowledge, of these matters. Knowing a little, they will be always learning more. The same publishers sent us a specimen No. of the Semi-Weekly TRIBUNE, with which we were very much pleased. The paper and printing were both good, and there was a large amount of good matter. There was a Stroll through the Philadelphia Market, by John S. Skinner, which very much pleased us. The lively and natural style of this gentleman is refreshing, and will give life to his FARMER'S LIBRARY, which Messrs. Greely & McElrath are about to publish. The earnest admiration with which he speaks of the Philadelphia butter, creates a feeling in our heart akin to that with which the Israelites in the desert remembered the *leash-pots* of Egypt!

From *Tait's Magazine*—("Liberal" in Politics and Religion.)

ENGLAND, IRELAND AND AMERICA.

We cannot profess any very lively sympathy with those Tory discontents, of which, on several recent occasions, Mr. D'Israeli has been the organ. Nor, much as we admire, and in a certain sense enjoy, the very brilliant and, in the main, just attacks of that extremely clever gentleman on the present premier, can we feel that he is the man to administer, with the best moral effect, the castigation due to political versatility. Those who helped to "organize" the "grand hypocrisy," and to enthroned the "dynasty of deception," have scarcely a right to complain of the result. They have themselves to thank for it. They might and ought to have known their man. Those politicians who, seven years ago, or five years ago, believed that Sir Robert Peel would make an honest Tory minister, believed without evidence and against evidence.

So far from fixing on this present session of 1845 to begin complaining of hypocrisy, deception, and imposture, we rejoice rather to see how rapidly hypocrisy is unmasking, and the reign of imposture drawing to a close. Sir Robert Peel was never less open to the charge of deception than at this moment. Instead of deceiving, he is undeceiving the world with all possible despatch and completeness. He is demolishing, with steady and unsparing hand, the false pretences by which he and his party climbed into power, and cutting the ground from under the feet of any public man who shall ever again dream of getting together a great party without a great principle. He is laying bare, at every point, the great hoax—tearing to rags and tatters the enormous make-believe. He is the general spiking his own guns, the conjuror letting us into the secret of his tricks. "Protection" and "Protestantism," it is clear, will soon cease to vex mankind.

The extraordinary cross and confusion of parties, both in and out of parliament, which has been produced by the great measure of the past month—the Maynooth Endowment Bill—aptly represent the medley of good and evil contained in the bill itself. The matter is one of which it is hard to speak, except in contradictions and antitheses, after the fashion of Master Touchstone. In respect of itself, that it is a bill for endowing Irish Catholic doctors in divinity, out of the pockets of English and Scottish Protestant laymen, it is naught: in respect that it is a bill for conciliating one third of the British empire, it is a good bill. In respect that it has a spice of "restitution" in it, we like it very well: in respect that the restitution is made in the shape of a new robbery from those who have never touched the plunder, and have therefore nothing to restore, it is a very vile bill. In respect that it is a bill for education, it pleaseth us well: in respect that the education is to be of the exclusive and sectarian sort, it is odious. As it is an attack on the Protestant ascendancy, it fits our humor well: but as it is "Popish," it goes much against our stomach. It is not wonderful that this bill has set Great Britain together by the ears, Tory against Tory, Liberal against Liberal—produced the oddest dislocations of party, and the oddest combinations. There has not been a political question agitated in our time on which there is so "much to be said on both sides."

But we cannot satisfy either ourselves or our

readers, by dismissing the matter thus lightly. There is, in every great public act or measure, however complicated by conflicting principles and tendencies, a preponderant *on-the-whole* right or wrong, which it is the business of the public journalist to ascertain and expound, according to the best of his ability. On a question of this magnitude and seriousness—involving, as it does, considerations of first-rate moment with regard to the contentment and pacification of Ireland, and the future course of our ecclesiastical legislation—we feel bound both to have a distinct opinion, and to give it distinct expression.

Practically, substantially, and on the whole, then, this Maynooth Endowment bill seems to us—with most serious faults of detail and even of principle, which must entirely preclude many sincere Liberals from giving it an active support—a measure of justice to Ireland; a blow at sectarian ascendancy; a move towards religious equality; an attempt, partial, indeed, in degree, and highly objectionable in mode—at rectifying the most outrageous injustice that ever disgraced the ecclesiastical legislation of a civilized community. As such, we must wish it well. And while we feel the difficulty of supporting a measure containing so much that every religious Liberal must strenuously disapprove, and have all respect for those Liberals who deem themselves bound to oppose it, we should deeply regret the success of the opposition.

That this measure is, in many grave respects, a highly disagreeable one to us, it must be needless to assure our readers. State endowment of a particular form of religious belief, a new ecclesiastical impost, taxation of the public in favor of the creed of a sect, the salaried of theologians out of the consolidated fund—nothing can possibly be worse, *except that state of things of which this scheme is a slight corrective*. But we cannot overlook the "circumstances" which turn this wrong into a sort of right. That gigantic iniquity, the Church of England in Ireland, is a circumstance, which, in our apprehension, completely forbids, so long as it continues to exist, the application of the principle on which we would otherwise deal with the matter. We confess we have no heart to introduce the "voluntary principle" into this business. It is not a case for the voluntary principle. If voluntarism is to be the rule of our ecclesiastical legislation, make it the rule—Irish Catholics have no sort of objection. But voluntarism is not the rule. Do what we will, we cannot yet get it made the rule. Not voluntarism, but state endowment is the rule of the ecclesiastical polity of Great Britain; and, this being so, it is hard that the case of the poorest, and most oppressed and insulted body of religionists in the empire should be made an exception. *Do-the-boys Hall* is scarcely the fittest field for a first experiment in ecclesiastical economy and *laissez-faire*. We must begin somewhere else the war against state endowment of theological creeds. We should be indeed delighted, if we could stop this Maynooth grant, in the pure, unaided strength of the voluntary principle; for, were the principle strong enough for that, it would be strong enough for some other things of considerably more practical moment. But we cannot. Voluntarism has, really and practically, no voice in the matter. The protestations of voluntarism are lost and drowned in the clamors of "No-Popery" and "Protestant Ascendancy." The strength of the

agitation is not in the voluntary principle, but in the no-popery and ascendancy passion. Voluntaryism is perfectly powerless in the matter, except as a subordinate ally of no-popery and ascendancy. As it is powerless, we think it should be neutral. One thing at least is clear; if the advocates of the voluntary principle feel themselves bound actively to oppose this bill, they are most especially bound to *oppose the opposition*—the most illiberal, bigoted, and fanatical opposition—with which it is assailed by men whose principles are as contrary to theirs as darkness to light.

We have nowhere seen the "Voluntary" view of the Maynooth endowment scheme better stated, than in the resolutions of the Independent Congregation of Argyle Square Chapel, in this city, adopted at a meeting held on the 31st of March, for considering the propriety of petitioning parliament against the bill. Our Independent friends, while disapproving of the bill, decided not to express their disapprobation in the form of a parliamentary petition, for reasons, the chief of which are stated as follows:—

"Because the most zealous opponents of the grant are the parties who have appropriated to themselves the largest share of the public property, which has been devoted to upholding ecclesiastical establishments, and whose object evidently is to rouse the zeal of dissenters to cooperate with them in maintaining their present ascendancy.

"Because, if we were to petition against this grant, on the ground that it was for the support of theological dogmas which we consider unscriptural and dangerous, we should thereby imply that the state has a right to judge what creeds are to be countenanced as true and scriptural, and thus admit a principle subversive of religious liberty.

"Because large grants have been made to colleges exclusively Protestant, and extensive revenues have been forcibly taken from Catholics and bestowed on Protestant institutions; and considering the system which is at present acted on by government, it does appear partial and unjust, that munificent funds should be expended on one class, while a comparative pittance is refused to another.

"Because, while we testify against all grants from the public funds for the promotion of any theological creed, we do not consider that we should be justified in joining in the clamor now raised against a particular sect, and that the sect which has suffered from the domination of a high church party, who, while they take every opportunity of lording it over dissenters, are now desirous to use them as tools for the accomplishment of their own purposes."

Nothing can be truer in fact, sounder in principle, or wiser in policy, than this. Liberal dissenters have nothing to do with agitating against Maynooth. Whatever the agitation may be in name and form, it is, in fact, substance, and practical tendency, an agitation against every principle most dear to them. It is an agitation, not for voluntaryism and equality, but for ascendancy and tyranny. It is an agitation, not against state establishments of religion, but in favor of one of the corruptest and most extortionate establishments under heaven. Its success would be a victory gained, not by, but over, religious equality and political justice. The defeat of the Maynooth grant would be the triumph of the Church of England in Ireland. The Independents of Argyle Square truly call this agitation a "clamor against a particular sect." The life and soul of the move-

ment is the no-popery fanaticism; and nothing that liberal dissenters can say or do, will make it anything else. With whatever generality of phrase they may word their opposition, so as to direct it against state endowments of religion in the abstract, it has the practical effect of a special attack on the Catholics and their creed. It has this effect, and it has no other. Those dissenters who have joined the movement on the Voluntary principle, have not thereby advanced the Voluntary principle one iota. They have only allowed themselves to be used as tools by their old oppressors; and when they are done with, they will be thrown aside. With the most perfect respect for the sincerity of such of our friends as have suffered themselves to be thus entrapped, we must take leave to more than doubt the wisdom of their course. The *John Thorogoods* and the *Charles Jameses*—the men who go to prison sooner than pay church taxes, and the men who send and keep them there—have really too little in common to render political cooperation on a church question natural or seemly.

We gladly turn from the disagreeable side of this matter, to notice those topics of congratulation which the ministerial proposal affords to all friends of religious liberty, and of justice to Ireland. This Maynooth scheme, with all its faults, is a most telling and decisive blow at the principle of ecclesiastical exclusiveness and ascendancy in general, and at the Church of England, in Ireland, in particular. It is now ruled, once for all, that the great ecclesiastical monopoly is a nuisance which must be abated—a wrong which must be righted. That the attempt is made to right it by the infliction of a little counter-wrong—a "reacting grievance on the other side," as Mr. O'Connell calls it—is, comparatively, a very subordinate consideration. By the consent of both the great parties in the state, it is declared and settled, that, not sectarian sympathies and antipathies, but "public feelings, and considerations of public policy," are henceforth to be supreme in Anglo-Irish politics; that we are to look at things, not as theologians, but "as legislators and statesmen;" and that "concession" is so far from having "reached its limits," that it can scarcely be said to have yet commenced. Nothing can now undo this. Though the Maynooth bill happened to be lost, for this session, no power on earth could put things back to where they were before. What has been said cannot be unsaid. The principles which have been so fully and formally recognized can never be ignored. All our leading public men, of all parties, now stand pledged, more or less, in one way or in another, to beat down ecclesiastical ascendancy, to open ecclesiastical monopoly, to rectify or abate the wrong of governing one third of the empire on sectarian principles.

We regard this Maynooth bill—taken in connexion with the avowals of purpose, or admissions of tendency, that have been made in the debates on it—as virtually sealing the fate of the Irish church establishment. Nothing can be plainer than that, if we are to have one established church in Ireland, we must make up our minds very shortly to have two, one for the few, and one for the many; a Protestant church, subsisting on tithes and lands, and a Catholic church, charged on the consolidated fund. *Two church establishments, or none*, is the alternative to which we are visibly and rapidly coming. As this is a question

in which the people of Great Britain will have to be consulted, and as we have no sort of doubt as to what their answer will be, we can only say, the sooner it is asked the better. Whether a state provision for the Irish Catholic hierarchy be a necessary logical consequence of giving Maynooth students separate beds, salarizing Maynooth professors at a higher rate than gentlemen's butlers, mending broken windows, and turning the "deserted barrack" into a decent and comfortable abode for Christian people, is an inquiry on which we need not enter too curiously. But it sufficiently appears, from indications given in debate, on both sides of the House, that the attempt to deduce this consequence practically will by-and-by be made. This is good news for the cause of religious liberty, equality, and voluntarism. The attempt cannot be made (if made at all) too soon. It will quite certainly break down, and the Irish Protestant state church will break down with it. When "restitution" comes that length, it will begin to be understood, that taxing the British people to restore to Ireland what the British people never took from Ireland, is a practical hull of too gross a sort to be tolerated even in Hibernian politics. The restitution must be made by the party in possession of the plunder. The wrong must be undone, not neutralized by a "reacting" wrong inflicted on an offending third party. Protestant ascendancy has got the plunder, and Protestant ascendancy must make the restitution. The national property of the Irish people must be unsectarianized—restored from unnational and antinational, to national uses. Meanwhile, we are disposed, for our own part, to acquiesce, as patiently as may be, in our share of the little "reacting grievance," which will facilitate the perception, and accelerate the redress, of the great original grievance. A state tax for the endowment of Catholic ecclesiastical education, is a quite bearable nuisance, considered as an *interim* arrangement—a transition measure towards the abatement of an immeasurably greater nuisance—a preparative of the public mind for that grand act of public policy and justice, the appropriation of Irish ecclesiastical property to the promotion of the moral and social welfare of the Irish people.

On the Oregon question, which has suddenly started into new life and importance, in consequence of the American president's cool assumption of a "clear and unquestionable" right to territory that has been for more than a quarter of a century, and is still, under negotiation, accompanied by the not vaguely hinted menace of a prompt settlement by *voie de fait*, we do not wish to enter now at any length; but we must express our satisfaction that ministers have taken the prudent course of giving America to understand, that, while all the policy, interests, and feelings of this country are profoundly averse to war, Great Britain does not mean to surrender clear and unquestionable rights of her own to mere bluster. We believe that the firm and pacific tone taken by Lord Aberdeen and Sir Robert Peel has very greatly diminished the risk of war in connexion with this frivolous and paltry affair. Now that the dangerous delusion has been dispelled—dangerous alike to the Americans and to ourselves—that "Ireland," or "the debt," or anything else, renders it absolutely impossible for Great Britain, in any case or contingency, to resist aggression by force, the governments of the two countries will meet on equal terms, and be able, we doubt not, to

settle the matter in a rational way. The case is clearly one for negotiation, "founded," as Lord Aberdeen says, "on the principle of an amicable adjustment, by mutual concession of extreme claims." The extreme claims of the Americans are, we think, sufficiently shown by the Earl of Clarendon and Lord John Russell to be preposterously extravagant; while our extreme claims have been over and over again compromised beyond recovery by concessions made in the course of negotiation, and are in themselves so barren of practical value, that it is only a pity we cannot, under present circumstances, handsomely and honorably make the Americans a present of them without more words. It is satisfactory to learn from the explanations given in parliament as to the joint-occupation convention at present in force—and dissoluble only by a year's notice, which notice has not yet been given—that the question is not of that instant urgency in point of time which the tone of the president's speech had at first led the public to suppose. The declarations of ministers justify the hope, that the interval yet open for negotiation and amicable arrangement will be industriously improved, and that the existing truce will end in a permanent and assured peace.

Although we do not see any serious reason for apprehending that this trumpety Oregon dispute will issue in that most hideous of calamities—that wildest and wickedest of follies—a war between Great Britain and America, it is impossible not to feel that the relations between the two countries are, generally, in a most unsafe and unsatisfactory state. We have become of late far too familiar with the idea of war with our transatlantic brethren. Question after question has arisen within the last eight or ten years that has brought us to the very verge of rupture, and has required all the resources of a skilful and laborious diplomacy for its adjustment. It is impossible that things can go on so forever. This habitual and growing familiarity with the idea of war—this perpetual talk of war—this "armed peace," which is ever on the brink of war, must, in the nature of things, come to war at last. Peace between two such countries as Great Britain and the United States, so closely related by all the ties that should bind nation to nation—a common ancestry, a common history, a common language, a common religion, similar laws, analogous institutions, and identical interests—is a thing that ought to be utterly incapable of ever being called in question. It should be, like representative government, freedom of worship and of the press, security of property, and the like, a fundamental political postulate—a tacitly-assumed first principle, needing no logical defence, and admitting of no possibility of a controversy. Why is this not so? The answer is to be found in our barbarous and suicidal commercial legislation, which has hindered the growth of interests and habits conservative of peace, and fostered the passions and antipathies stimulant of war. Were the natural relations of the two countries their actual relations—Ohio prairies feeding the workers of Lancashire looms, and Lancashire looms clothing the tillers of Ohio prairies—the inexhaustible powers of production, and fitnesses for exchange, represented by the words "American Corn," and "British Manufactures,"* freely developing themselves for mutual good—questions

* See the valuable pamphlet lately published under the title "American Corn and British Manufactures," by Clarke, London.

like this of Oregon, might, indeed, arise from time to time, but they would be comparatively innocuous. Two nations, the business of whose existence should be to feed and clothe each other, would find their diplomacy a wonderfully simple affair. Any way of settling such matters as those which now we find so full of embarrassment and irritation, would be cheerfully acquiesced in by each, as a preferable alternative to the wicked madness of a war, ruinous to both. Most unhappily, we have, so far as possible, deprived ourselves of those securities of peace, to be found in extended and various commerce. We have minimized, to each nation, both the terrors of war, and the benefits of peace. We have kept up a sort of war in the midst of peace—the “war” (to use the words of Mr. Macgregor, of the board of trade) “of material interests, or, more properly speaking, of material injuries—that is, a war of custom-houses or fiscal forts, with their garrisons of revenue-officers and servants.” We have followed a policy of commercial isolation, jealousy, and contention, which has fatally impaired the natural guarantees of peace, and exasperated the passions whose natural language is war.

The present state of commercial opinion, on both sides of the Atlantic—of which, as regards America, the recent presidential election is a decisive sign—affords ground for hope that we are nearly come to the end of our “war of material interests, or injuries,” and that the hour is not remote, when the two great nations of the Anglo-Saxon race will conclude that best and most enduring of all possible treaties of peace, whose terms are registered not in protocols, but in bills of exchange and merchants’ ledgers—whose ultimate guarantees are not powder magazines and cannon-balls, but flour barrels and cotton bales. There is still, thank Heaven! with all our monopolies, intercourse enough left between Great Britain and the United States, to render war horribly calamitous to the material interests of each country; and with this, and firmness and good temper, on the part of our statesmen, we shall no doubt be able to weather the difficulties of the Oregon question. For the future, we must trust to the efforts of the Free-Traders of the two countries, to produce a state of things that will render war a commercial, political, and moral impossibility.

From the Christian Remembrancer.

“THE HOST OF GOD.”

“And Jacob went on his way, and the angels of God met him. And when Jacob saw them, he said, This is God’s host; and he called the name of that place Mahanaim.”—Gen. xxxii. 1, 2.

“The Host of God!” from whence came they,
And whither are they bound?
Are they of those that watch by day,
And keep their nightly round?
Come they from realms celestial, sent
On God’s high message here?
Guide they the nightly firmament?
Guide they the rolling sphere?

“The Host of God!”—How seemed that show,
In heavenly pomp arrayed?
Marched they in bright angelic row,
With glittering wings displayed?
Or were they clad in flesh and bone,
Like children of the earth,
While but their stately step and tone
Betrayed their glorious birth?

“The Host of God!”—How did they greet
Our faint and wandering sire?
Passed they his train with flying feet,
And chariot wheels like fire?
Or did they cheer his spirit there
Amid that desert lone—
Tell him that granted was his prayer,
His secret sorrows known!

“The Host of God!”—How wild the thought,
That lowly man should meet,
Mid the drear realms of wolf and goat,
The step of holy feet;
Whence come they—whither go—is dark;
Their purpose, all unknown;
Yet shine they as a meteor spark
Through midnight darkness thrown.

Still may they wheel their bright career
By lonely rock or tree,
Had we the Patriarch’s ear to hear,
His holy eye to see!
The desert wild, the crowded way,
By heavenly step is trod;
Through earth and air—by night, by day—
Walks still—“The Host of God!”

From the Home Missionary Magazine.

“THERE WAS SILENCE IN HEAVEN.”

CAN angel spirits need repose,
In the full sunlight of the sky?
And can the veil of slumber close
A cherub’s bright and blazing eye?

Have seraphims a weary brow,
A fainting heart, and aching breast?
No, far too high their pulses flow,
To languish with inglorious rest.

How could they sleep amid the bliss,
The banquet of delight above?
Or bear for one short hour to miss
The vision of the Lord they love?

Oh! not the deathlike calm of sleep
Could hush the everlasting song:
No fairy dream or slumber deep,
Entranced the rapt and holy throng.

Yet not the lightest tone was heard
From angel voice or angel hand,
And not one plumed pinion stirred
Among the bowed and blissful band.

For there was silence in the sky,
A joy no angel tongues could tell,
As from its mystic point on high
The peace of God in stillness fell.

Oh! what is silence here below?
The quiet of concealed despair,
The pause of pain, the dream of wo,—
It is the rest of rapture there.

And, to the way-worn pilgrim here,
More kindred seems that perfect peace
Than the full chants of joy to hear
Roll on, and never, never cease.

From earthly agonies set free,
Tired with the path too slowly trod,
May such a silence welcome me
Into the palace of my God!

From Chambers' Journal.

STATUE OF PETER THE GREAT, ST. PETERSBURG.

THE rapid change which Russia underwent during the reign of Peter the Great, her extraordinary advances under this sage legislator, are among the most important events of which history preserves the record. Proud of his glory, the nation wished to erect a monument in commemoration of his great actions, which in his own city should be a distinctive object to all posterity. In the then young state of their art, some deliberation took place before the design of the structure was decided on; during this the hero died, and the erection of the monument was consequently reserved for the reign of the empress Catherine II. The first step to be taken was the appointment of an artist capable of undertaking such a work. The choice fell upon M. Falconet, who, in his conception of an equestrian statue, determined that the subordinate parts should bear an equal impress of genius. He found that the pedestals in general use have no distinctive feature, and adapt themselves equally well to any subject; and being of so universal application, they produce no new or elevated feeling in the mind of the spectator. He wished to make the czar appear in his principal character—the father and legislator of his people; great and extraordinary in all; undertaking and completing that which others were unable to imagine. To carry out this conception, a precipitous rock was fixed on for the pedestal, on which the statue should appear with characteristics distinguishing it from those erected to other sovereigns.

The first idea was to form this pedestal of six masses of rock, bound together with bars of copper or iron; but the objection was urged that the natural decay of the bands would cause a disruption of the various parts, and present a ruinous aspect, while it would be difficult to insure perfect uniformity in the quality and appearance of the different blocks. The next proposal was to form it of one whole rock; but this appeared impossible; and in a report to the senate, it was stated the expense would be so enormous, as almost to justify the abandonment of the undertaking; and even if made of six pieces, as first proposed, the outlay would be excessive. At length it was determined to transport to the city the largest rock that could be found, and add other portions to it as might be judged necessary. Still, great misgivings prevailed as to the possibility of removing the contemplated mass. The search was then begun, but with less success than had been anticipated, as the country around St. Petersburg is flat and marshy, affording no traces of stone, while the nearest mountains are in the province of Finland. A whole summer was passed in exploration; and the idea of forming the pedestal of several smaller portions was again entertained, when a large stone was discovered near Cronstadt, which it was determined to apply as the principal mass; and the task of its removal was confided to the admiralty, who, however, as well as many other mechanics applied to in turn, refused to undertake it. The search for the smaller blocks was nevertheless continued, although no one appeared to have any definite notion of the use to be made of them in the event of their discovery.

Under these unexpected difficulties, the forma-

tion of the pedestal was intrusted to an officer of the corps of cadets, who had already given proofs of his mechanical skill. A native of Cephalonia, he had been compelled, for an offence against the laws, to seek refuge in Russia, where he lived under the assumed name of Lascary. He had strenuously recommended the adoption of the original design; and a few days after his appointment, he received information from a peasant of a large rock lying in a marsh near a bay in the Gulf of Finland, about twenty miles from the city by water. An examination was immediately instituted: the stone was found covered with moss; and on sounding around it, the base was fortunately ascertained to be flat. Its form was that of a parallelepipedon, 42 feet in length, 27 feet in width, and 21 feet in height—dimensions sufficiently extensive to realize the conceptions of M. Falconet, the sculptor. But when the authorities, under whose direction the work was placed, saw the prodigious size of the rock, they again hesitated, and recommended its division into smaller portions. The fear of accidents, however, and the hardness of the stone, caused them to yield to the representations of the engineer, who was now favored by the support and encouragement of the minister Batsky; and the intelligence of the empress being superior to the senseless clamor raised by the envious and the ignorant, she gave orders for the commencement of the work.

A working model of the machinery with which it was proposed to remove the rock from its situation was first made. M. Lascary resolved on effecting this removal without the use of rollers, as these not only present a long surface, which increases the friction, but are not easily made of the great diameter that would have been required, owing to the soft and yielding nature of the ground on which the work was to be performed. Spherical bodies, revolving in a metallic groove, were then chosen as the means of transport. These offered many advantages. Their motion is more prompt than that of rollers, with a less degree of friction, as they present but small points of contact. Stout beams of wood, 33 feet in length, and 1 foot square, were then prepared. One side was hollowed in the form of a gutter, and lined, the sides being convex, to the thickness of two inches, with a compound metal of copper and tin. Balls of the same metal, five inches in diameter, were then made, to bear only on the bottom of the groove. These beams were intended to be placed on the ground in a line, in front of the stone, while upon them were reversed two other beams, prepared in a similar manner, each 42 feet long, and 1½ feet square, connected as a frame by stretchers and bars of iron 14 feet in length, carefully secured by nuts, screws, and bolts. A load of 3000 lbs., when placed on the working model, was found to move with the greatest facility; and the inventor hoped to satisfy the minister as well as the mechanics by its public exhibition. The former was well pleased with the experiment, and expressed his belief in the possibility of removing the stone; while the latter raised absurd objections, with the cry of: "the mountain upon eggs."

The first thing to be done, as the rock lay in a wild and deserted part of the country, was to build barracks capable of accommodating 400 laborers, artisans, and other persons required, who, with M. Lascary, were all lodged on the spot, as the readiest means of forwarding the

work. A line of road was then cleared from the rock to the river Niva, a distance of six versts,* to a width of 120 feet, in order to gain space for the various operations, and to give a free circulation of air, so essential to the health of the workmen in a marshy district, as well as to the drying and freezing of the ground—a point of much importance, when the enormous weight to be removed is considered. In the month of December, when the influence of the frosts began to be felt, the operation of disinterring the rock from the earth, in which it was imbedded to the depth of 15 feet, was commenced: the excavation required to be of great width—84 feet all round—to admit of turning the stone, which did not lie in the most favorable position for removal. An inclined plane, 600 feet in length, was afterwards made, by means of which, when the stone was turned, it might be drawn up to the level surface.

Among the objections urged against the possibility of removing the rock, was the anticipated insurmountable difficulty of placing it upon the machine destined for its transportation. But the engineer was confident, and wisely preferring simplicity to complication, resolved on employing ordinary levers, known technically as levers of the first order; these were made of three masts, each 65 feet in length, and 1½ feet in diameter at the larger end, firmly bound together. To diminish the difficulty of moving these heavy instruments, triangles 30 feet high were erected, with windlasses attached near the base, from which a cord, passing through a pulley at the top, was fastened to the smaller end of the lever, which, being drawn up to the top of the triangle, was ready for the operation of turning: each of these levers was calculated to raise a weight of 200,000 lbs. A row of piles had been driven into the ground at the proper distance from the stone on one side, to serve as a fulcrum; and on the other a series of piles were disposed as a platform, to prevent the sinking of the mass on its descent. Twelve levers, with three men to each, were stationed at the side to be lifted, and the lower extremities being placed under the mass, the upper ends were drawn downwards by the united action of the twelve windlasses. When the stone rose to the height of a foot, beams and wedges were then driven underneath, to maintain it in that position, while the levers were arranged for a second lift. To assist the action of the levers, large iron rings were soldered into the upper corner of the rock, from which small cables were passed to four capstans, each turned by 36 men, thus maintaining a steady strain; while the stone was prevented from returning to its original position when the levers were shifted. These operations were repeated until the rock was raised nearly to an equipoise, when cables from six other capstans were attached to the opposite side, to guard against a too sudden descent; and as a further precaution against fracture, a bed, six feet in thickness, of hay and moss intermingled, was placed to receive the rock, on which it was happily laid at the end of March, 1769. As it was of great importance that all the workmen should act at one and the same time, two drummers were stationed on the top of the stone, who, at a sign from the engineer, gave the necessary signals on their drums, and secured the certainty of order and precision in the various operations.

Meantime the machinery for the removal had been made. Of the lower grooved beams already

* A verst is 3500 English feet.

described, six pairs were prepared, so that when the rock had advanced over one pair, they might be drawn forward and placed in a line in advance of the foremost, without interrupting the movements. The balls were laid in the grooves 2 feet apart; the upper frame, intended as the bed for the rock, placed above: the mass, weighing in its original form, 4,000,000 lbs., was then raised by means of powerful screws, and deposited on the frame, when it was drawn up the inclined plane by the united force of six capstans. The road did not proceed in a direct line to the river, owing to the soft state of portions of the marsh: in many places it was impossible to reach a firm foundation with piles fifty feet in length. This naturally added to the difficulties of the transport, as the direction of the draught was frequently to be changed. Piles were driven along the whole line, on both sides, at distances of 300 feet apart; to these the cables were made fast, while the capstans revolved; two of which were found sufficient to draw the stone on a level surface, while on unequal ground four were required. The rate of motion was from 500 to 1200 feet daily, which, when regard is had to the short winter days of five hours in that high latitude, may be considered as rapid. So interesting was the spectacle of the enormous mass when moving, with the two drummers at their posts, the forge erected on it continually at work, and forty workmen constantly employed in reducing it to a regular form, that the empress and the court visited the spot to see the novel sight; and, notwithstanding the rigor of the season, crowds of persons of all ranks went out every day as spectators. Small flat sledges were attached to each side of the stone by ropes, on which were seated men provided with iron levers, whose duty it was to prevent the balls, of which fifteen on a side were used, from striking against each other, and thus impeding the motion. The tool-house was also attached, and moved with the stone, in order that everything might be ready to hand when required. Experiments were tried with balls and grooves of cast-iron; but this material crumbled into fragments as readily as if made of clay. No metal was found to bear the weight so well as the mixture of copper and tin; and even with this the balls were sometimes flattened, and the grooves curled up, when the pressure by any accident became unequal. The utility of rollers was also tried; but with double the number of capstans and power, the cables broke, while the stone did not advance an inch.

The work went on favorably, when it was suddenly checked by the sinking of the stone to a depth of 18 inches in the road, to the great chagrin of the engineer, who was suffering under a severe attack of marsh fever. He was not, however, disheartened, and speedily remedied the accident, spite of the idle clamors of the multitude; and in six weeks from the time of first drawing the stone from its bed, he had the satisfaction of seeing it safely deposited on the temporary wharf built for the purpose of embarkation on the banks of the river, when the charge fell into the hands of the admiralty, who had undertaken the transport by water to the city.

A vessel or barge 180 feet in length, 68 feet in width, and 17 feet from deck to keel, had been built with every appliance that skill could suggest, to render it capable of supporting the enormous burden. Great precautions were now necessary to prevent the possibility of the falling of the rock into the stream: water was let into the vessel until

she sunk to the bottom of the river, which brought her deck on a level with the wharf; the rock was then drawn on board by means of two capstans placed on the deck of another vessel, anchored at some distance from the shore. Pumps and buckets were now brought into use to clear the barge of the water with which she had been filled: but to the surprise and consternation of those engaged, she did not rise equally: the centre, bearing most of the weight, remained at the bottom, while the head and stern, springing up, gave to the whole the form of a sharp curve; the timbers gave way, and the seams opening, the water reëntered rapidly: 400 men were then set to bale, in order that every part might be simultaneously cleared; but the curve became greater in proportion to the diminution of the internal volume of water.

M. Lascary, who, from the time the rock had been placed on the deck of the vessel, had been a simple spectator of these operations, which occupied two weeks, now received orders to draw it again upon the wharf. He immediately applied himself to remedy the error—which had been committed in not distributing the weight equally—without removing the stone. He first caused the head and stern of the barge to be loaded with large stones, until they sank to a level with the centre; the rock was then raised by means of screws and beams of timber, diverging to every part of the vessel, placed under and against it; and on the removal of the screws, the pressure being equal in every part, she regained her original form. The water was next pumped out, the stones removed from the head and stern, a ship lashed on each side of the barge, which, on the 22d September, arrived opposite the quay where it was intended to erect the statue.

Not the least difficult part of the work, the debarkation, remained to be done. As the river was here of a greater depth than at the place of embarkation, rows of piles had been driven into the bottom alongside the quay, and cut off level at a distance of eight feet below the surface: on these the barge was reared; and, to prevent the recurrence of the rising of the head and stern when the supports should be removed, three masts, lashed together, crossing the deck at each extremity, were secured to the surface of the quay. It was then feared that, as the rock approached the shore, the vessel might heel, and precipitate it into the river. This was obviated by fixing six other masts to the quay, which projected across the whole breadth of the deck, and were made fast to a vessel moored outside; thus presenting a counterpoise to the weight of the stone. The grooved beams were laid ready, the cables secured, and at the moment of removing the last support, the drummers beat the signal: the men at the capstans ran round with a cheer; the barge heeled slightly, which accelerated the movement; and in an instant the rock was safely landed on the quay.

Such was the successful result of an undertaking, extraordinary in its nature and the circumstances in opposition to it.* An example is here afforded to those who may have to struggle with difficulties in mechanical art, that will stimulate them to attempt what may appear impossible to the timid and unreflecting. He who contends successfully with the adverse opinions of men of learning, and the blind prejudices of the multitude,

*The whole expense of the removal did not exceed 70,000 roubles, or £14,000; while the materials which remained were worth two thirds of the sum.

achieves a moral as well as a physical triumph, deserving of high praise and imitation.

It is to be regretted that the effect of this unrivalled pedestal was marred by the diminution of its size. Under the directions of the artist who had so successfully formed the statue, it was pared and chiseled, until the weight was reduced to 3,000,000 lbs.; and the outline, instead of being left bold and broken, as best suited the character of the group, was made smooth and uniform. It forms, however, one of the chief attractions of St. Petersburg, standing "in the square opposite the Isaac Bridge, at the western extremity of the Admiralty. Here the colossal equestrian statue of the founder of this magnificent city, placed on a granite rock, seems to command the undivided attention of the stranger. On approaching nearer, the simple inscription fixed on it, in bronze letters, 'Petro Primo, Catharina Secunda, MDCCCLXXXII.', meets the eye. The same inscription in the Russian language appears on the opposite side. The area is enclosed within a handsome railing, placed between granite pillars. The idea of Falconet, the French architect, commissioned to erect an equestrian statue to the extraordinary man at whose command a few scattered huts of fishermen were converted into palaces, was to represent the hero as conquering, by enterprise and personal courage, difficulties almost insurmountable. This the artist imagined might be properly represented by placing Peter on a fiery steed, which he is supposed to have taught, by skill, management, and perseverance, to rush up a steep and precipitous rock, to the very brink of a precipice, over which the animal and the imperial rider pause without fear, and in an attitude of triumph. The horse rears with his fore-feet in the air, and seems to be impatient of restraint, while the sovereign, turned towards the island, surveys with calm and serene countenance his capital rising out of the waters, over which he extends the hand of protection. The bold manner in which the group has been made to rest on the hind legs of the horse only, is not more surprising than the skill with which advantage has been taken of the allegorical figure of the serpent of envy spurned by the horse, to assist in upholding so gigantic a mass. This monument of bronze is said to have been cast at a single jet. The height of the figure of the emperor is 11 feet, that of the horse 17 feet. The bronze is, in the thinnest parts, only the fourth of an inch, and one inch in the thickest part; the general weight of metal in the group is equal to 36,636 English lbs.**

EGGS PICKLED.—The farmers' dames in some parts of Hampshire, in their notable endeavors to turn everything to good account, have acquired much fame for pickling eggs, which, whilst they constitute a somewhat novel feature in the catalogue of condiments generally, are at the same time particularly relishing. When eggs are plentiful, they take from four to six dozen of such as are newly laid, and cause them to be boiled hard; then, divesting them of the shells, they place them in large-mouthed earthen jars, and pour upon them scalded vinegar, well seasoned with whole pepper, allspice, ginger, and a few cloves of garlic. When the pickle is cold, the jars are stopped down quite close, and the former will be fit for use in the course of a month afterwards. The eggs thus treated are held in high esteem by all the farm-house epicures in that part of England.

From Chambers' Journal.

THE MISHAPS OF A YOUNG GERMAN.

A TRUE STORY.

In the year 1790, Alexander Facqz, Viscount de Honig, a young and enthusiastic German, determined to see the world, and acquire in the course of a few months a quantity of knowledge sufficient to last him the rest of his life. Leaving his mother's house in Suabia, he repaired first to Paris, for the purpose of getting some insight, if possible, into the French Revolution, which was then going on; but chancing shortly after his arrival to meet with a commercial friend who was on the point of setting out for London, he resolved to accompany him to that capital. The great metropolis afforded him occupation for some time; but at length beginning to think that he had exhausted London, and having heard much about the sister island, he resolved to pay a visit to Dublin. An essential preliminary to his trip was the receipt of a remittance from his mother. This having been written for and procured, the month of March, 1791, found him walking idly up and down the streets of Dublin, looking at Irish sights with German eyes, and forming from all that he saw the most German conclusions. Somehow or other, however, his money wore away much faster than he wished; and he soon found it necessary to send another letter to his mother, requesting the too-indulgent lady to forward him a second remittance.

Living in lodgings in expectation of money is at no time a very agreeable predicament, whether in Dublin or anywhere else; and in the year 1791, the transmission of letters, and especially of money letters, between this country and the continent, was attended with even greater risk than in these days of more correct management. Our young German waited and waited on, but the money never came. He told his landlord the true state of the case, and for a while his gentlemanly manners, his young honest-like face, and his interesting foreign accent, operated in his favor. The landlady would not allow the landlord to use him ill. Still, landladies are but human beings, and there are limits to the power of a lodger's face in attesting his promises of payment; and at length, after the bill had run up to a considerable amount, the landlady went over to her husband's way of thinking, and our young German was arrested for the debt, and thrown into prison.

"A situation more dreadful can scarcely be conceived," a novelist would say; and, without going quite so far as this, we can well believe that, for a young German of birth and education, who had left his country to acquire a knowledge of men and manners, thus to find himself locked up in a Dublin prison, was somewhat unexpected, and certainly anything but pleasant.

A Dublin prison of the old school was quite a different thing from its modern representative. There was no obligation by law to support prisoners for debt; and there were cases in which such prisoners were supposed to have died of want, and many more in which deaths from want would have occurred, but for the charity of fellow-prisoners. Our hero's only hope lay in the expected arrival of his mother's long-delayed remittance. Alas! the remittance had miscarried. The viscount had made no secret of his expectation of a money letter; and when a bill drawn on a house in Dublin was addressed to him from London, some evil-disposed persons had managed to get possession of it, and

feloniously converted it into cash. It was not till a month after that the viscount received another letter, apprizing him that the money had been sent. Why he did not pursue the parties for forgery, or at least compel the payers of the bill to do so, and by that means recover the amount, is not stated. The circumstance of being a stranger, and poor, may perhaps explain what is otherwise so unaccountable. Be this as it may, this unfortunate, and, as we must pronounce him, heedless young man, would have perished for want in prison but for the compassion of his fellow-captives. His case was so peculiar, and his appearance so unusually interesting, that a prepossession was soon established in his favor, so strong, indeed, that they not only supported him by their charity in prison, but even set on foot a subscription for the purpose of discharging his small debt, and setting him at liberty. But here was another difficulty. What was he to do when he got out of prison, without any money in his pocket! Any ordinary person, with hands accustomed to work, and a mind used to buffet the world, would have found no difficulty whatever; would have launched out of prison and exerted himself nobly; but to our languid and lugubrious German, with his white hands and inactive disposition, there seemed no resource whatever. He thought himself positively the most wretched man on the face of the earth; and when he looked out at the prison window, it was with the sickly feeling of a man who, never having had to rely upon himself, could not conceive how locomotion was possible in this world without money, nor how money was procurable in any other way than by asking one's mother for it. Accordingly, a letter was despatched to his mother acquainting her with his situation, and begging an immediate remittance; and in the mean time he remained in prison, and shared the bounty of Mr. Fawcett and Monsieur Lafontaines, two debt prisoners who had taken a particular fancy to the unhappy foreigner.

Sunk pretty nearly to the verge of despair, in an evil hour temptation triumphed over the integrity of the weakly young man. About this time considerable sums were raised in England and Ireland by benevolent persons for the benefit of the French refugees; and it was suggested to Facqz, that, by representing himself to be a French refugee, he might obtain a sum of money sufficient to maintain him for some time, and so put an end to all his difficulties. It would be only a sort of loan; he could repay the money afterwards. So spake necessity; and our young hero had too yielding a constitution to resist the temptation. Having procured the money under the false pretence of being a French refugee, he prepared to leave prison and go in search of a lodging. It so happened that two men, who had been in the habit of visiting a friend in the Marshalsea, and who had become acquainted with Facqz, offered to accompany him, and find out a cheap and suitable lodging. Their names were James Jones and Thomas Neville. Seeking a lodging is a sore trial to anybody: greater men than our hero have sunk under it. It is an art only to be acquired by long practice; and it was with no small delight that Facqz accepted the kind offer of his two acquaintances to put him on the right track. Away went the three friends to seek lodgings. This street and that street were tried; this knocker knocked, and that bell rung; here a little slattern girl came to the door with a thin squeaking voice, there a huge dirty landlady; still the

right place was not found. At last they came to a house with Mr. James P—— on the door-plate. Here surely was a respectable house; quite the thing that was wanted.

Mr. Jones, who seems to have been the obliging spokesman of the party, said they would be obliged to Mrs. P—— for a sight of the rooms up stairs. By all means, said the lady; and so Jones and Facqz proceeded on their exploratory tour of the apartments. Neville declined to ascend. He was very much fatigued, and begged to be allowed to take a seat in the parlor till his friends came down. This arrangement being quite agreeable to all parties, Mr. Neville seated himself in the room below, and before the return of Jones and Facqz, he contrived with little difficulty to appropriate a watch which hung over the mantelpiece. Something was wrong about the lodgings, and the party left the house; but hardly had they proceeded twenty paces when an alarm was raised. They were pursued and captured, and the watch found on Neville's person. On the 5th of October, 1791, they were tried before the recorder and magistrates of Dublin. Facqz, of course, protested his innocence, and no doubt he was innocent. But he had been in the company of two notorious swindlers, and to all appearance a coadjutor in the crime; and to crown his misfortune, it was now shown that he was a German, and not a Frenchman, as he had formerly declared himself to be. No man, it was argued, could be an honest man who had committed such a deliberate falsehood. Influenced by these considerations, the jury included Facqz in the guilt of watch-stealing, and along with his two acquaintances he received sentence of transportation.

Behold our poor languid hero again in prison, and this time not for debt, but for felony, and waiting transportation. The mere imprisonment in such a place would have been punishment enough for the greatest crimes. There was then no established system of prison discipline; the prisoners were left to the tender mercies of the turnkeys; and those who could not bribe them, suffered the harshest treatment. Facqz had no money, and he became one of the victims.

In these dark days Mr. Samuel Rosborough was the Howard of Ireland. The poor forgotten prisoners were his peculiar charge. For twenty years he had been accustomed to visit the prisons, rendering assistance to those who had no other friend. Facqz had heard of his name and character; and in the depths of his despair sent him the following letter:—

"SIR—From the many acts of generous kindness done by you to the unfortunate in this prison, I am induced to hope you will suffer my present melancholy tale to be heard by you, and interfere in my behalf.

"I am under the dreadful sentence of transportation, charged with committing a crime at which my nature revolts. To enter, however, upon any justification of myself at this time is not my object. From the 7th of this month, I have been lying in a cell, loaded with irons, which have been put on by Mr. Walsh, the turnkey, when he knew I had no money to give him. Well knowing you will not suffer me to remain any longer in this loathsome place without your merciful interference, I shall look with anxious expectation for you.

"During these five last days, my mind has enjoyed a calm by attentively listening to the prayers of an unfortunate man in the next cell, who, I hear,

is shortly to suffer death. Oh that I were so near that period, for then I would be released from my sufferings!

"Excuse this freedom, and permit me, in addition to my fervent prayers for your welfare, to subscribe myself—Your most obedient and devoted servant,

ALEXR. FACQZ.

October 26, 1791."

Mr. Rosborough immediately visited him; and his interference had the effect of procuring him better treatment. The poor prisoner began to hope that the same benevolence might be of use in procuring his release; and accordingly he sent many letters to Mr. Rosborough, giving an account of himself, his previous mishaps in Dublin, and the manner in which he had been brought into his present situation. A person possessed of more sense would have told his story in a plain, straightforward, matter-of-fact way; but our young German's letters to Mr. Rosborough were so fanciful, so sentimental, and so full of ohs, and ahs, and adjectives, that the good philanthropist read them with considerable distrust. At length, however, owing to the considerate interposition of Mr. Lafontaine, who had now left prison, and who had procured some knowledge of the viscount's family, Mr. Rosborough was induced to listen to what Facqz told him, and to attribute the sentimentalism of his letters to their right cause—namely, to his being a German, and one of weak character. "From me," wrote Facqz to him, "you dissipate every gloom, and cheer and vivify my whole soul. May you long live to enjoy that ennobling virtue which alone gives dignity. May every instance of benevolence and humanity shown by you in this and every other place, be blessed with success; and when the hoar-frost of winter's age shall besprinkle your head, and the divine lamp of life yield its last gleam, may you enjoy that felicity which is the portion allotted by him who said 'I was in prison and ye visited me.' I have requested Mr. Lafontaine to call on you. He will tell you who I am. If not redeemed from this horrible place, I shall perish. Mine eyes can scarce see what I have written; they are sore with weeping; my head aches for want of rest, and mine ears are tormented with hearing blasphemies. Oh that I had never been born, then should I be a stranger to such a place as this!"

Moved by these wailings, and by his own innate benevolence, Mr. Rosborough did make some interest with the recorder in the young man's behalf. But the sad fact of his having passed himself off as a French refugee, and obtained money on false pretences, again rose up against him; for the recorder himself had been connected with the management of the refugee fund. Nothing could be done for such a person, and again Mr. Rosborough gave him up. Oh that terrible falsehood!

Meanwhile, poor Facqz had been thinking of another way of effecting his escape. He had heard that money could do it, and he had written pressingly to Germany for money. Many wonderful escapes had been effected from the prison about this time, the mode of which was not discovered till afterwards. The principal agent in these escapes was the head-turnkey's wife. She had offered to give Facqz his liberty for forty pounds, and the following was to be the plan adopted. She was to administer to him draughts of tobacco water, and other narcotics, report him ill, and have him transferred to the hospital, where he was to grow gradually worse and die. When he was

fairly dead, he was to be let out of prison; a corpse having been procured to be laid in his bed, for the satisfaction of the doctor. The plan may appear doubtful to our readers; but it had succeeded before, and Faqz hoped it might succeed in his case. But the forty pounds were still wanting; and the beginning of the year 1792 found him still languishing in jail.

Letter after letter he sent to Mr. Rosborough, beseeching him to reconsider his case; and at length the good gentleman began to get a notion of the real simplicity of our hero's character. He interested himself again in his behalf, and represented the affair as well as he could to the recorder. Here was a young German, he said, of good family, who had got into a scrape, whether owing to folly or criminality, he would not say; but would it not serve all the purposes of banishment to send him home to his friends in Germany, instead of incurring the expense of sending him to Botany Bay! The recorder was induced to use his influence with the lord-lieutenant, and the consequence was, that Faqz received a free pardon. The rapture of Faqz on this announcement being made to him, threw him into a fever, from which he did not recover without difficulty. On his recovery, he plead his majesty's pardon in court, and was set at liberty, as will be seen from the following copy of a certificate, the original of which may be inspected by any one who chooses to consult the records of the clerk of the crown's office in Dublin:—"Certificate"—At an adjournment of sessions on the 31st of May, 1792, Alexander Faqz de Honig pleaded his majesty's free pardon, which was allowed by the court, and he was thereupon discharged.—Extracted from the crown books—ALLEN and GREENE, Clerks of the Peace."

Our hero's mishaps were not yet over. Taking leave of his kind friends, Mr. Rosborough and Mr. Lafontaine, he proceeded to Liverpool with a little money in his pocket, supplied by them. "I had scarcely landed in Liverpool," he says in the account which he afterwards wrote to Mr. Rosborough of his adventures, "when I narrowly escaped breaking my leg in consequence of the absence of enclosures for the cellars in that filthy town. Into one of these holes I fell, and stripped thereby the bone of my leg completely of the flesh from the ankle to the knee." Detained in Liverpool for a long time by this injury, his money was again all expended; and we hardly know by what means he arrived at York, whither it appears he had gone, with a view of proceeding thence to Hull, where he hoped to procure a passage to Hamburg. "I arrived at York," he says, "about five o'clock in the evening, with fourpence in my pocket, my shoes worn to pieces, the big toe of my right foot projecting out." Strolling into York minster, he attracted the notice of a benevolent and venerable clergyman, who entered into conversation with him, and after hearing his story, and putting its truth to the test by asking him questions which none but an educated man could answer, showed him much kindness, and not only paid his coach fare to Hull, but gave him a letter of introduction which secured his passage to Hamburg. At length, after several ups and downs more, he reached his home in Suabia, and was clasped in the arms of his own dear remittance-sending mother. One of his first cares, after reaching home, was to write to his friends, enclosing the amount of money he had borrowed from them.

Our hero had probably obtained more wisdom and business talent in the course of his Irish misfortunes, than he would have obtained by any other mode of training; for the remainder of his life exhibits more sense and sedateness than might have been expected. Having procured a commission in the Russian army, he proceeded to St. Petersburg, where the only drawback to the pleasure he took in his military duties was, that it was very cold. His abilities and accomplishments appear, however, to have succeeded in gaining him good friends; for, after serving in some inferior diplomatic situations, he was sent by the Empress Catherine on a mission to the English cabinet in the year 1796. He embraced the opportunity of doing two things, both of which were characteristic; in the first place, he bought a splendid carriage in London, with which he said he meant "to cut a dash in St. Petersburg;" and in the second place, revisited his friends in Ireland. "One morning," says Mr. Rosborough in narrating the story, "I received a message from the Kildare street hotel, informing me that a gentleman just arrived there wished to see me immediately. On repairing thither, I was received by a servant in gorgeous livery, who spoke with a foreign accent, and introduced me into a room, in which to my unspeakable astonishment, I saw Viscount Faqz and Mr. Lafontaine seated at breakfast."

The three friends spent several happy days together. Unluckily, however, during our hero's visit, Mr. Lafontaine, whose circumstances were still embarrassed, was again arrested for debt; and it bespeaks the true character of our hero, that, though he had bought a splendid carriage, and was living in a princely style, he yet had no other means of extricating his friend out of his difficulty than by pledging his watch. After staying a week in Dublin, during which he visited his old prison, he returned to London, and thence to St. Petersburg, from which he kept up a constant correspondence with his two friends. In one of his letters, he tells them that he had recovered his estate of Honig, which had been taken possession of by the Carmagnoles; and he expresses his anxious wish that they were all three together living upon it, where he says "he would nurse and cherish them, and make them so happy, that they should be like *diamonds in cotton*." It was not till 1803, however, that, after having seen some hard service, and been completely shattered in health, he was able to retire to the Chateau de Honig. His last letter to his Irish friends is dated February, 1803, and in it he is as sentimental as ever. He appears to have died in the same year.

And now, what was this Alexander Faqz, Viscount de Honig! He was a specimen of what we often see in the world—an accomplished, amiable, interesting young man, with a tolerably good head, a very affectionate heart, and a weak, haughty, unmuscular character, that always began crying when a difficulty came in the way.

Like *Æsop* of old, we may conclude our tale with a moral, which it may be well for all young persons, including gentlemen under the age of twenty-five, to bear in mind. Let nothing tempt you to tell a falsehood; take care of the company you keep; labor honorably for your bread; and try to depend as little as possible on remittances from your mother.

From Chambers' Journal.

SHIPWRECK OF THE DELPHINE.

TRANSLATED FROM THE FRENCH.

[THE subjoined, though perhaps less characterized by startling occurrences than many other narratives of a similar nature, may yet possess some claims to our attention from the successful issue of the persevering efforts adopted for the safety of the isolated victims of calamity. The painful interest attaching to events of this nature, is increased in the present instance from its having taken place in the same region as the shipwreck of the *Wager*, one of Anson's squadron, of whose wreck so interesting an account has been left by the ancestor of the poet Byron. The peninsula of *Tres Montes*, mentioned in the following translation, is the same over which, it may be remembered, Byron and his companions passed with their Indian guides. All the travellers who have visited that part of America agree in their description of the climate, which is bad in the extreme. Everything is always wet: there are scarcely ten days in a year on which snow or rain does not fall; and not more than thirty on which it does not blow with the greatest violence. The island of *Chiloe* is situated in a great bay at the southern extremity of *Chili*, and is the largest of a group the number of which, comprehending those of *Chonos*, is eighty-two. With these remarks, which were necessary for the proper understanding of what is to follow, we proceed at once to the narration.]

We sailed from *Havre* for *Valparaiso* on the 30th March, 1840, in the ship *Delphine*, Captain *Coisy*, with a crew of sixteen sailors and four passengers. In three days we were clear of the channel, and, the wind being favorable, saw the *Canaries* and *Cape de Verd Islands*, and soon after crossed the line. In short, at the expiration of thirty days from the time of our departure, we had reached the latitude of *Rio Janeiro*. The wind then became contrary, and, forcing us to lie to, so retarded our progress, that we did not arrive in the latitude of the *Falkland Islands* until the 28th May. On the 30th we saw *Staten Island*, and on the 9th June, *Cape Horn* and *Terra del Fuego*. In spite of the usual stormy weather of this region, and the enormous masses of floating ice which we encountered in all directions, we doubled the *Diego Islands* on the 11th. The bad weather still continued: but on the next day a short interval of brightness enabled us to take an observation, for the last time, as it proved, on board the *Delphine*. The wind then veered round to the south, and we believed ourselves sure of a speedy termination to the voyage, when, without any warning, it chopped round to the north-east, bringing its attendant fog. We were steering our course by computation, when in the night of the 19th, a few hours before daylight, we were suddenly awoken by the frightful grinding of the ship's keel upon the rocks. "Land, land!" cried out the second mate; and in an instant every one, crew and passengers, was on the deck. On all sides the vessel was surrounded by rocks and breakers, while through the gloom the outline of high land was visible at a distance, exaggerated by the obscurity, and adding to the terrors of the moment, which it would be difficult to describe. The ship was yet afloat, but the shock had been too severe to leave any hope that she would continue to swim; every instant we feared she was

sinking under us. The passengers ran to the pumps, and the crew, by orders of the captain, flew to the rigging. The pumps were soon dry, when, on hastening to the tiller, we found to our consternation that the rudder had been carried away. The ship struck again. We braced the yards round, to allow her to drift off the land, and cut the lashings which held the long-boat and yawl to the deck, during which time the grinding of the keel on the rocks became more violent than before, threatening the entire destruction of the vessel. We let go the best bower, in the hope of keeping her from drifting farther in; but the anchor dragged over the smooth rocky bottom. The water gained on us so fast, that we hastened to get the long-boat overboard: a work of great difficulty, as it dashed against the bulwarks with every roll of the ship, and endangered the lives of the men. At length we succeeded in getting her afloat; and throwing in some provisions, we all jumped in, followed by the captain, who was the last to leave the deck. It was then five o'clock, and we waited for daylight among the rocks and sea-wrack, watching the ship, which at last struck on some rocks surrounding a small island. At daybreak we perceived a bay, towards which we rowed, and landed ourselves and the provisions on a sandy beach. The captain, with the sailors, returned immediately to the ship, to save, if possible, a greater quantity of provisions, and other matters necessary to our existence. They found her quite fast about half a mile from the place of our landing; all the between decks full of water, with the exception of the stern. They returned to the shore three hours afterwards, bringing the yawl, both boats laden with everything they could lay their hands on. A temporary tent was hastily set up, in the centre of which a great fire was lighted; round this we spread some sail-cloth saved from the cargo, which served us for beds during the night. The two following days were passed in saving more provisions from the wreck, while a party who remained on shore got up another tent with the fore-sail, that had been brought for the purpose. A few days afterwards, a violent squall drove the long-boat on the rocks and staved her in, which obliged us to haul her on shore, to prevent her entire loss.

A fortnight passed in this manner, the yawl replacing the long-boat in our visits to the ship, when the weather would permit. The captain took an observation, from which we learned that our position was in 49 degrees south latitude, upon an island two leagues in length, separated by a narrow channel from the great island of *Campana*, as we ascertained from the English chart which the captain had taken the precaution to save, with his sextant and two compasses, on the first day of the wreck. Everything conspired, unfortunately, to render a long abode in this dreary region inevitable—the winter just commenced, the continued northerly winds of the season, and the distance which separated us from any settlement of Europeans. We calculated that our stock of biscuits and flour would last nearly four months, and determined that our wisest course would be to wait until the bad season was over, before venturing to seek for assistance in the long-boat, which by that time, as was proposed, would be repaired and decked in.

The captain did not forget that, in our present circumstances, the preservation of the health of the men from the inclemency of the climate was

the first duty. Another tent was built with the mainsail, of greater dimensions than the former, in which the beds were so arranged as to be at some distance above the surface of the ground. The spot fixed on for the erection was the entrance of a wood which overlooked the whole bay, and in the first days of July* we took possession. The old tent was left standing, in which, although the materials at our disposal were very scanty, we managed to build an oven.

Certain unequivocal indications had led us to believe that the island was occasionally visited by savages. We had seen in different places a rude kind of hut, constructed of branches of trees, in which we found the remains of shell-fish and the bones of animals. Shortly after we entered on our new habitation, the captain's dog, which had been saved along with us, growled all night in spite of our efforts to pacify him. We were all on the alert the next morning on learning that the prints of naked feet had been seen on the sand: none of our party went barefoot, and the traces were those of persons running from the wood where our tent was situated. This circumstance led us to suspect that we were watched; and indeed, on the 9th July, while our party had gone on the usual salvage trip to the wreck, one of the passengers who had wandered to a distance returned hastily, telling us he had seen the savages. We armed ourselves immediately with all the offensive weapons within reach; and the captain, having advanced with a few men, soon came in sight of what he was in search of. There were nine of them, unarmed, their only clothing being the skin of a seal hanging over their back. At first they hesitated to move; but seeing that we approached with friendly demonstrations, they became familiar. We gave them some presents; but prevented their going to our tent, which they seemed greatly to desire. After staying a short time they left us, but soon repeated their visit, bringing with them their wives, whose clothing did not differ from that of the men. Subsequently, we permitted them to enter our tent, and went several times to visit them upon the different islands to which they transport themselves in canoes. Their huts were similar to those we had seen in our island, but were covered with skins. These savages are generally of middling height, strong, and well formed. They are evidently the same race as the Indians of Chiloe, and are always accompanied by great packs of dogs, which they use for hunting seals, on whose flesh, with occasional supplies of shell-fish, they principally subsist. This food, however, often fails them in rough weather, when their canoes cannot put to sea. In their visits to us they were always asking for food, which was most probably their principal object; at the same time they often stole some of our things without being detected. In short, they appeared to us to be very miserable, and lazy to excess. The wreck of the *Delphine* was a fortunate event for them, as they picked up many articles floating about among the rocks.

During the earlier period of our residence on the island our time passed in a very uniform manner. The shore party provided wood for the fire, of which the consumption was indispensably great, on account of the continued rainy weather, and for the prevention of sickness. Another party was regularly employed with the yawl in saving things

from the wreck. Our young lieutenant, *Lepine*, took charge of this laborious duty, and, by his zeal and activity, sustained the courage of the sailors both on the ship and among the islands after she was broken up. Meantime the month of September drew on. The carpenter had finished the repairs of the long-boat, which was covered with a deck, and rigged as a schooner, as well as was possible in our state of privation. Although the weather remained unseasonable, we always hoped it would change for the better. The captain, however, resolved on putting his project into immediate execution—to sail with a few men for San Carlos of Chiloe, to seek the means of rescuing the whole party from their perilous situation. The necessary preparations were made in consequence, and on Tuesday the 3d September our little vessel was launched, in order to be ready for the first favorable wind. But what was our disappointment when we saw that she filled with water before our eyes! We tried at first to stop the leaks while she was afloat; but this being impossible, we were compelled to haul her again on shore, where we took away a portion of the lining, and carefully examined the seams, and then caulked and stopped every chink by which it was possible the water could enter; and on Saturday evening, at high water, she was again launched. The next day we found her again half full of water; for her timbers were old and crazy. The captain, however, persisted in his resolution, and gave orders for her to be baled out—replying to those who expressed uneasiness that the wood would swell up in the water. A quantity of sail-cloth was used for ballast, which at the same time served for beds, although, in order to prevent their complete soaking, the baling was kept up incessantly. The provisions, calculated for eight days, with wine and spirits, were put on board; and a generous allowance of wine was given at dinner to the master and four men who were selected to accompany the captain and Lieutenant *Lepine*. At two in the afternoon they set sail, with fine weather and a stiff breeze from the south.

Seven of our number had left us; thirteen remained behind. We watched for a long time, from the top of the cliffs and rocks, the departure of our companions in misfortune, on whom our fate depended. The day was far advanced when we lost sight of them, and we returned to our tent with a feeling of sadness, justified by our actual position; for, leaving out of sight the probability of the loss of those who had gone away—an event but too possible—how much was there, in our own position on the island, to give cause for uneasiness. Was it not to be feared that the savages, who, until then, had been inoffensive, would become emboldened on seeing our diminished number; and that their greediness, or possibly want alone, might lead them to attack us, and take by force our little remaining provisions, as well as other things in our possession which had excited their cupidity? These reflections, however, were soon banished by the majority of our little band. Those who had drunk farewell to their companions in a pitcher of wine, were not sorry to drink a few more bumpers to their prosperous voyage: conviviality, in short, was the prevailing feature of the moment, when an unexpected incident drew us all out of the tent. A small hut, built of wood and moss by one of the sailors and a passenger, not far from our tent, had taken fire, and was nearly consumed, with all its contents, before

* A winter month answering to the January of Europe.

we could succeed in putting it out. This event finished the day, and each one threw himself, dispirited and melancholy, on what was called his bed.

Next day, nothing else was thought of but what was best for us to do under our present circumstances. Just before the departure of the long-boat, the daily ration for each man was eight ounces of biscuit. At this rate our stock would not last more than three weeks, and we could not expect to be released at least before a month. We therefore reduced our allowance to six ounces, and of wine one quart a-day. We had a great quantity of spirits, and were thus enabled to continue the usual allowance to the sailors. In this way we hoped to go on for more than a month. The savages came to visit us as before, and soon saw our diminished strength; but their demeanor towards us did not alter. The first thing they did whenever they landed was to come and warm themselves at our fire, so that we were careful to leave some one to keep guard when we went out to fish.

The month of September went by; our biscuit diminished rapidly; we reduced the ration to four ounces a-day. Towards the middle of the first week of October we began to feel uneasy. We remembered that, on the third day after our companions sailed, a heavy gale had set in. Was it not to be feared that they had perished? And, without taking the worst view, it was still possible that the captain might not find the expected succor at Chiloe. In this case, as our abode on the island would be lengthened, we decided on another reduction of our ration of biscuit to two ounces; just sufficient for a little daily sop. We succeeded in making the savages understand that, if they brought us food, we would repay them with the things they most desired; from which time they began to bring us the eggs of sea-fowl. Thus we went on until the middle of October, the sixth week since the long-boat sailed. Our anxieties now augmented, and many of us began to think of the means for our own rescue.

We had already, as a precautionary measure, collected the planks and pieces of wood of the shattered vessel. The idea occurred to us of constructing a boat capable of carrying the whole party, and we recommended to those who went out fishing to bring in the masts, yards, planks, or other portions of the wreck which they might find floating. By this means a great quantity of materials was collected; and the carpenter began to work upon the keel, which was thirty feet long.

On the 15th October our little ration of two ounces of biscuit failed us entirely, and we were reduced to the indifferent shell-fish, and the eggs—which were almost always addled when the savages brought them to us—and to some birds which we occasionally killed. We wished the natives to bring us some of the flesh of the sea-wolf, which we had seen them eat; but whether the season was unfavorable, or they caught no more than sufficient for themselves, we could never obtain any. They gave us some dogs, and appeared greatly astonished when they saw that we had eaten them; for, notwithstanding the repugnance of some among us to eat dogs' flesh, our hunger was so great that we devoured them all. At the end of October we had ceased to hope, except in ourselves. Some of us were always occupied in seeking for wood or food; while the

others were as persevering in their labors on the vessel, which went on very slowly, as much from the weakness to which our privations had reduced us, as from the bad weather which often prevented our working, and the want of proper tools. Thus the time wore away until the middle of November, all of the party suffering more or less from attacks of dysentery: still, in spite of the continual rain and prevailing humidity, and the want of shoes, no one was so ill as to be detained in the tent. The hope of eventually succeeding in our efforts to escape from this dreary life supported our courage. We could see that, although slowly, our vessel approached completion: the slips, with the necessary inclination for the launch, were securely placed; the head and stern-posts were fixed on the keel; the greater portion of the ribs were made, and we cut others every day in the woods, to complete the number.

If we were deceived in the hope of saving ourselves, and in the means for its prosecution, the resolution of attempting it never failed us. Such was our situation when, on the morning of the 12th November, we heard a sailor who had just left the tent cry "Sail, ho! sail, ho!" with all his might. Although this same sailor, deceived by a false appearance, had raised the same cry a month previously, we all ran precipitately towards the shore. This time the report was not false; we saw a vessel anchored in the bay. A heavy shower prevented our seeing distinctly, but we thought she belonged to some ship of war. The yawl was afloat in a moment, and a few men jumping in, were soon on board, not the boat of a man-of-war, but a *lanche* of San Carlos. Those on board of her were not strangers; they were Captain Coisy, Lieutenant Lepine, our sailors and companions, who came to deliver us and bring us provisions. It would be useless to dwell on the universal joy that prevailed, and the eagerness with which both parties inquired about what had transpired.

The long-boat had left the island on the 6th September in so leaky a condition, that two men were constantly engaged in baling; during the first night the sea broke over her repeatedly, threatening to carry all to the bottom. On the fifth day they passed Cape Taitachoun, and intended to double the island lying to the north of it, but were prevented by a gale, which obliged them to lie to for better weather. After some days, alarmed by the diminution of their provisions, they made sail, keeping as near their course as the wind would permit, and two days afterwards entered the great channel which separates the Chonos Archipelago from the Cordilleras. Thus they continued, with alternations of fair and foul weather, sometimes rowing, at others driven back, or landing to collect shell-fish for food, for twelve days, when one afternoon they saw smoke at a distance, to which they immediately directed their course, taking precaution to look to their arms, for fear of savages. The smoke was found to rise from a fisherman's fire, who, as soon as he understood their critical situation, set off to fetch provisions from his *casa*, three leagues distant, while they waited his return. After this they crossed to the islands of the Chiloe group, at one of which, marked Valasco Port, they were detained nine days by stress of weather, and were driven back in another attempt to cross the channel: but on the 3d October they again set sail, and on the 4th happily arrived at Chiloe, where they landed,

for the purpose of procuring provisions at the first inhabited spot they saw. On the 10th, thirty-five days after their departure from our island, they reached San Carlos, having had incessantly rainy weather during the whole of this perilous voyage.

The captain lost no time in his endeavors after his principal object; the consular agent gave him all the assistance in his power; but, unfortunately, no ship of war or merchant vessel was lying in the port; there were only the miserable *lanches* of the country, quite unfit for such a voyage as that to the place of our detention. Everything in the shape of a vessel was examined, in the hope that one might prove serviceable, but in vain. The captain then heard of a large and commodious *lanche* at a place twenty-five leagues higher up the channel, and, without a moment's delay, he took a whale-boat and started for the settlement indicated; but what was his disappointment to find, on arrival, that the vessel was yet on the stocks, and only half completed. He returned immediately to San Carlos, and determined, as nothing better was to be had, to hire a *lanche* in good condition which had arrived during his absence. This kind of vessel, which is used only for the transport of wood or potatoes from one island to the other, is not decked, and a deck for the voyage to the open sea was indispensable. In spite of all the diligence that could be used, it was the end of October before she was ready. Provisions for two months, in the mean time, had been collected, with the consul's assistance; and on the 30th, the captain, with the lieutenant and four men, sailed from San Carlos in the *lanche*, which had been rigged as a lugger. The master was left behind, as fatigue and privation had rendered him incapable of undertaking the return voyage: the others embarked, confiding in the generous hope of saving their companions. They took a whale-boat in tow, for convenience in landing; but, after beating about among the islands for some time, when they reached the open sea it labored so much that the seams opened, and they were compelled reluctantly to cut it adrift. Finally, after repeated delays, vexations, and dangers, they recognized the approaches to our island, and at seven in the morning of the 13th November, as already described, they were at anchor in the bay.

The unexpected return of the captain, after seventy-three days' absence, when we thought him lost, placed us immediately in a state of abundance as regarded provisions; but we were not the less desirous of quitting a place where we had been so long detained in spite of ourselves. It was impossible, however, to go off in the teeth of the north wind, and we were obliged to wait three weeks for a favorable change. On Thursday the 3d December, we sailed at three in the afternoon, towing our yawl, whose preservation had cost us so much labor. We did not keep it long, for when off Cape Taitachaoun it broke loose, and drifted away in a squall. This was a serious misfortune, as it deprived us of the means of going on shore to cook our provisions, and of the chance of escape in case of wreck. The squall was the precursor of a furious gale, from which we incurred the greatest danger; the waves breaking over us from stem to stern, and pouring down into the confined space below, where we were crowded one on the other. Our situation was indeed a terrible one. We had given up all hope of safety, and resigned ourselves to the worst, when the storm began to

moderate. We were quite uncertain as to our position, and steered for some land that was in sight: but what was our astonishment to find, when we drew near, that it was the island from which we had so recently sailed. We must have drifted sixty leagues during the four days that the gale continued. In our present circumstances, we were glad to reënter a place we had so much desired to quit eight days previously. Having lost the yawl, we were forced to make a raft, which we drew from the shore to the *lanche*. The savages had not, as we feared, destroyed our tent; it was still standing. The miserable creatures had dug up the potatoes which we planted, with the view of leaving them a resource in the article of food. We divided our party: one half went every night to sleep on board the *lanche*, as a measure of precaution. The weather seemed to grow worse as the season advanced. We were covered with vermin, and dreaded that we should again be without provisions. On the 2d January, 1841, the weather moderating, we were enabled once more to put to sea. No sooner had we cleared the bay than a heavy sea broke our rudder, and forced us to lie to. We secured it as well as possible with lashings, which quickly wore out and snapped. We then cut a few fathoms off our small chain, with which we secured the rudder from further danger. The weather continued stormy; but as the wind was in our favor, we shortly after passed the peninsula of Tres Montes; and once among the islands, we looked upon ourselves as saved.

After this we had fine weather. On the 14th, we landed for fresh provisions, of which we were in great need; and on the 20th, to our great joy, we arrived at San Carlos, eighteen days after our last departure from the island, and seven months and one day from the date of the wreck. We had great reason to congratulate ourselves that, during this long period of privation, suffering, and danger, not one of the party was lost. The captain had neglected nothing in his power to prevent such a misfortune, not only while we were on the island, but in moments of danger, never hesitating to expose himself the first to whatever might happen. To his courage and perseverance must be attributed the success of his great object—the safety of all.

On our arrival at San Carlos, the French consul, M. Fauché, who had so generously assisted the captain on his former visit, hastened to supply our wants. To him were we indebted for the means of pursuing our voyage, and eventually returning to our native country.

NEW MANURE.—The German papers give currency to the statement that M. Liebig, the celebrated professor of chemistry at the University of Glessen, has discovered a mineral substance, which, when combined with guano, will produce one of the most fertilizing manures known. It is added, that a joint-stock company, with a capital of 120,000*l.* sterling, composed for the most part of leading English capitalists, was, immediately on the discovery being made, formed for the purpose of carrying on, upon a large scale, the manufacture of the new compound. Among the subscribers are, however, several eminent professors of agriculture, who, according to the *Impartial du Rhin*, give out that the application of this substance to the culture of land will produce an entire revolution in the agricultural system.

The Life and Adventures of Martin Chuzzlewit.
By CHARLES DICKENS. London, 1844.

A Christmas Carol in Prose, being a Ghost Story of Christmas. By CHARLES DICKENS. London, 1844.

The Chimes—A Goblin Story. By CHARLES DICKENS. London, 1845.

THE career of Mr. Dickens has been a singular and splendid one. Ten years ago he was toiling obscurely in the service of the London daily press; but a series of sketches, contributed to the columns of a newspaper, and afterwards published in a separate form, received so much praise that their author was stimulated to greater efforts. The *Pickwick Papers* at once established his reputation, and ensured for him fame and affluence in a literary career. He has now given to the world, besides smaller compositions, six voluminous works of fiction, each nearly twice as long as *Waverley*. These have been circulated by tens of thousands at home, and have been translated into foreign languages. They have been eagerly read by all classes of his countrymen, from the polished lady of rank to the astute man of business, from the grey-headed philosopher to the schoolboy. They may be seen, not only in every drawing-room, every club, and every tavern, but lying unhidden on many a merchant's desk, and lawyer's table, and student's shelf, and even lurking in the chamber of the judge, and the closet of the clergyman. They have relieved, with the play of fancy and feeling, the gloomy languor of many a sick-room. Their author has been honored and caressed; criticism has never worn a frown; the great and learned have assembled in festive halls to do him honor, and the voice of praise from his native land has been loudly echoed from the other side of the Atlantic.

It can scarcely be doubted that, with so large and so enthusiastic an audience, his works are exercising very considerable influence; and it is not perhaps surprising that Mr. Dickens, perceiving this, should, in his later publications, have assumed the tone of a public monitor and moral teacher, with somewhat too ostentatious and dictatorial an air. It may be interesting, therefore, as it is now several months since his last work of any magnitude was circulated, to glance rapidly over his writings, dwelling chiefly on the most recent, and endeavoring to estimate their influence, as a class, on the public taste and tone of feeling.

The "Sketches by Boz" are written by one well acquainted with every phase of the low life of London, and are graphic, lively, and varied; but they are nearly all of an unpleasant cast—they depict chiefly vice, vulgarity, and misery. The drunken clerk "making a night of it;" the degraded and desperate female convict; the abandoned drunkard hurrying on his own fearful end; the retired shopkeeper making a fool of himself by falling in love; the contemptible squabbles and intrigues of a city boarding-house; the over-taxed youth expiring in the arms of a widowed mother;—such are the principal subjects of his pencil. But his lighter wit is also sometimes conspicuous, as in the very amusing description of a balloon ascent from Vauxhall. It is interesting to find here the quarry from which he has since dug the material for all his best figures, and to light on many a rough block, since hewn and squared. Thus, in a scene at the Old Bailey, we have the

first rude idea of the trial and condemnation of Fagin the Jew; in "the Parish Beadle" we recognize the original of Mr. Bumble, and in one corner (vol. i., p. 33) we trace the distinct outline of the delectable Mrs. Gamp.

The Sketches, however, would soon have been lost in oblivion had they not been followed up by "The *Pickwick Papers*." There, amidst an infinite diversity of fun and frolic, of merry satire and biting sarcasm, of serious description and the broadest farce, the genius of a master has drawn the inimitable portraits of *Pickwick* and *Sam Weller*. They are depicted with the most perfect truth, consistency, and humor; and while they represent general classes, stand before us in the clearest individuality. Who does not know Mr. *Pickwick*, his bald head and circular spectacles, and "those tights and gaiters, which, had they clothed an ordinary man, might have passed without observation, but which, when Mr. *Pickwick clothed them*, inspired involuntary awe and respect?" who is not fond of this simple-hearted man, so unsuspecting of vice and imposition, but so unaffectedly indignant at them when discovered; so indomitably sincere, that when, to vent his anger at *Dodson* and *Fogg*, he attempted, for the first time in his life, to call up a sneer, he failed most signally to accomplish it; so fond of personal comfort, yet so ready to forego it to do a service to any human being; placed in so many ridiculous situations, and getting into so many laughable adventures, and yet always retrieving himself by his persevering kindness, delicacy, and honour! Yet who would recognize Mr. *Pickwick* without the faithful *Sam Weller* as his attendant, whose attachment to his master is perhaps the best feature in the character of both! This model of the ready-witted, impudent, imperturbable, Londoner of the lowest class, is thrown into a hundred various situations, and is equally cool and ready in them all. With scarcely any coarseness, he has the most racy peculiarity of dialect, and the most diverting variety of jest and banter. Whether, as at his first appearance as boots at the *White Hart Inn*, he describes the company in the house:—

"There 's a wooden leg in number six, there 's a pair of Hessians in thirteen, there 's two pair of halves in the commercial, there 's these here painted tops in the snugery inside the bar, and five more tops in the coffee-room. Stop a bit; yes, there 's a pair of Vellington's, a good deal vorn, and a pair o' lady's shoes, in number five"—

or telling stories of the rogueries and follies of his venerable parent—a topic on which he runs on, he tells us, "like a barrow with the wheel greased;" or as a witness, foiling *Sergeant Buzfuz*; or copying with *Job Trotter*; or inditing a love-letter; or communicating to *Bob Sawyer* his theory of dead donkeys and post-boys;—he is never once tiresome or dull. About all the other numerous characters there is great life and energy; and the whole book, although having little story or plot, is full of animation, except some occasional tales, which, we venture to say, no one ever read a second time. We have some glimpses into the haunts of London wretchedness; but the chief merit lies in the pleasantries of the numerous playful caricatures or parodies, where the absurdities and humors of provincial politics, the courts of law and dishonest attorneys, lionizing ladies, and scientific societies, are shot at in the election, the

trial, the fête champêtre, and the club, with pointed, but not envenomed, shafts of ridicule. There have been few happier hits than Mr. Blot-ton of Aldgate's apology:—

"He had no hesitation in saying he had used the word in its Pickwickian sense. Personally, he entertained the highest regard and esteem for the honorable gentleman; he had merely considered him a humbug in a Pickwickian point of view."

The still life and scenery are painted with quaint accuracy, not descending to extravagance; as the large melancholy parlor at the Great White Horse, Ipswich, where "a small fire was making a wretched attempt to be cheerful, but was fast sinking beneath the dispiriting influence of the place." There is a vein of good, manly, and flexible, if not elegant, English writing, which we wish the author had continued to cultivate. It is not wonderful that this work was hailed with a burst of admiration, and we may safely class it as a most original and valuable addition to our literature.

In his next publication—"Nicholas Nickleby"—Mr. Dickens turned his power of graphic and humorous description to good account, by awakening sympathy for the unhappy inmates of certain Yorkshire schools. His portraiture of Wackford Squeers and his amiable family was so happy, the internal economy of Dotheboys' Hall, and its weekly distribution of brimstone and treacle, so inimitably depicted, and the story of poor Smike told with so much delicate and touching pathos, that while his readers laughed and cried almost in the same breath, we rejoice to believe that the author's purpose was attained in the exposure of the shocking system, and that he has earned the blessings of many an emancipated little victim. But although Squeers and his academy formed the principal and most original feature in this tale, it abounded with other spirited delineations. Who can forget Mrs. Nickleby, the garrulous, senseless, yet withal respectable, English matron of the middle ranks; or her generous and dutiful son; or her daughter, the gentle, assiduous, and high-minded Kate! Who would pass over the brothers Cheeryble—although, as characters in a fictitious narrative, they have the fault of being too truly individual portraits, and have, it is to be feared, no class to correspond to them; or the eccentric non-descript, Newman Noggs! Can any one repress a smile at the remembrance of the rare fun with which the Mantalins are described! and Mr. Crummies, with the infant phenomenon, and the rest of his company of strolling players! The more sunny passages stand in pleasant contrast to the dark shade thrown by the grim, iron-hearted Ralph Nickleby, and the profligate Sir Mulberry Hawk, with his patron and victim, Lord Verisopht. There is sometimes, however, a little prolixity, and the mere dull vulgarity of the Kenwigs family, Miss Petowker, and Mr. Lillyvick, and the low baseness of Arthur Gride and Peg Sliderskew, are blemishes on the work. There is much less playful caricature and quaint satire than in the Pickwick Papers, but more earnestness and a higher tone, with the same good, expressive, unaffected style of composition.

"Oliver Twist" is the shortest of these tales, and the most compact. It has fewer traces of having been written in monthly portions. The story makes more regular and rapid progress, and the characters are more strikingly grouped and

contrasted; while it yields to none in the vigor and power with which many of the scenes are drawn. But, on the other hand, the main interest is made to depend on the most debased and villainous agents; and the work has done much towards creating in the public a morbid interest in such heroes and their mode of life. A relish for such writing speedily becomes a craving, and the public learn to demand an insight into the haunts of crime, and to desire a familiarity with the habits and adventures of the profligate and brutal. With what an array is the reader here brought into contact! Fagin, and his den of thieves and cut-throats; the ferocious Sikes, with his crimes of violence and blood; the wretched Nancy, and her dreadful life and shocking fate; the melo-dramatic villain Monks, with the sensual Noah Claypole, and the selfish Bumble, are the prominent figures, and are minutely described with all the author's ability and power. If we laugh at all, it is at the comic adventures of Master Charley Bates and the Artful Dodger. We almost imagine the author an incipient Eugene Sue, and that *Oliver Twist* is but the English version of "The Mysteries of Paris." There is some pleasant writing in the other parts of the book, and some pretty little touches of pathos in the scenes between Oliver and Dick; but none of the good characters are remarkably graphic, or indeed above mediocrity, while Mr. Grimwig, who is always threatening to eat his head, is rather below it. Oliver is a nice enough little boy—very unlike what would be natural amid such scenes, and very perversely, by his persevering goodness, doing credit, contrary to the author's intention, to the training he had received under Mrs. Mann and the "parochial authorities." Mr. Dickens' prejudice against these personages has, it must be owned, much the air of an unreasonable and narrow-minded antipathy; but there are some excellent scenes in which they are satirized—such as the pauper's funeral, and the consternation at the workhouse when "Oliver asks for more."

The names of "Master Humphrey's Clock" and the "Old Curiosity Shop" bring with them the recollection of little Nell. It is, perhaps, hard to call her unreal, when we know that she was meant to represent the once living and beloved object of the author's affection; but we cannot conceal that, to our mind, there is something vague, undefined, and abstracted about this little heroine. It is difficult, indeed, to give individual character to the description of children in romance, and Mr. Dickens has here scarcely done more than embody, in a shadowy form, the general qualities of youth, innocence and sweetness. Nell is too good and pure—there is a want of human passion and imperfection; and while we weep, and admire, and love, we refuse to conceive the object of our feelings as a living thing of the same earthly mould. She might be an allegoric Una, or a Peri from an ærial paradise; but not a sister child of clay. Nevertheless, there are many beautiful passages, where the strokes of the same magic pencil which so often moves our laughter, melt us in unbidden tears; such as the anxious watching of the child over her grandfather when lured away by the gamblers, and the sad but peaceful scene of her deathbed. The gradual ebbing of mortality in the old man is also touched with a feeling hand, and we are compensated for much that is painful and even unnatural in his feverish and wild career. Quilp, still more unreal than his poor victim Nell,

is a grotesque monster, an impossible incarnation of fiendish attributes. Yet the plots hatched by this strange wretch, with Sampson and Sally Brass, have some attractions for the taste that has learned to be pleased with Sikes and Fagin. But how shall we characterize Dick Swiveller? or fathom the fun that lurks in his tipsy gravity, his delicious mock heroics, his "prodigious talent in quotations?" How can we remember gravely his despondency when eclipsed by the market-gardener, which he soothes by playing "A way with Melancholy" on the flute all night; his adventures with the small servant, and his happy discovery that "there had been a young lady saving up for him after all." But we fear that the inimitable Dick is a dangerous character, for his vices are forgotten or even loved in the excessive diversion he affords us.

What train of villainous shapes have we next crossing the stage like a dance of the seven deadly sins? The chief actors in "Barnaby Rudge." The polished, selfish, unprincipled Sir John Chester, the detestable hypocrite Gashford, the murderer Rudge, the savage Hugh, the vile hangman Dennis, the contemptible but wicked Sim Tappertit, and the loathsome Stag—a goodly regiment. They are brought before us again and again with tedious repetition, and the horrors of the riot of 1780 are detailed with sickening minuteness and interminable length, under pretence of teaching a useful lesson against "a religious cry." Mr. Dickens is as little at home on the ground of history and philosophical politics, as on that of natural scenery and rustic manners. There is little in the other characters to relieve the monstrous tissue of horror and villainy. Indeed, Barnaby's raven, Grip, is much the most sensible and spirited personage in the whole piece. The tale has certainly some redeeming points; but it dragged its slow length along from week to week, until the public, and we dare say, the author too, were heartily sick of it.

In the "Life and Adventures of Martin Chuzzlewit," Mr. Dickens has a more definite and important moral aim, which is to expose the vice of selfishness in various forms, and, in some cases, exhibit its cure. In his hero, young Martin, he has been very successful, and has drawn a most instructive character. He is represented as a young man possessed of many good qualities, and capable of strong and permanent attachments; but so habitually selfish, that even in friendship and love he regards his own comforts, his own wishes, and his own sacrifices—for he can make sacrifices—exclusively. There is great merit in the development of this feature of Martin's character, and in the interest the reader is made to take in it, and in its discovery and cure, although the principles upon which his conversion takes place are not very intelligible or satisfactory.

Mr. Pecksniff, the sentimental hypocrite, may be intended for a portrait, but is undoubtedly a caricature. The author may have meant to draw a probable and consistent person to represent a class, like Mr. Pickwick and Mrs. Nickleby; but, if so, he has failed, chiefly because he has of late spoiled his hand for so delicate a task, by drawing Quilps and Dennises, and Sim Tappertits. But we are content to accept Mr. Pecksniff with his "moral crackers," as a grotesque exaggeration of a very amusing kind, tending to deepen our horror at the knavery which hides itself "under

covert and convenient seeming," and to enjoy the humor with which the adventures of this "false and simular man of virtue" are described, without critically and nicely examining under what category he ought to be placed. We cannot help observing, however, in passing, that the world, already suspicious enough, has no great need to be put on its guard against deliberate hypocrisy, and that the conscions and crafty hypocrite is not very likely to profit by the exhibition of himself. It would be a more useful task for the novelist to expose with kindness and candor that unconscious hypocrisy, the right name of which is *inconsistency*, and which is practised, perhaps, by all men in a greater or less degree, and certainly by multitudes who are perfectly sincere, but whose practice, for want of self-discipline and self-control, does not keep pace with their principles—who are worse than they think themselves, but better than their captious enemies would make them out to be.

Tom Pinch is placed at the opposite pole of the moral world from Pecksniff, and is the most simple-hearted, unselfish, affectionate creature imaginable. He is devotedly attached to his master Pecksniff, whom he believes to be his benefactor, and to be all that he pretends to be. He "steeps the Pecksniff of his fancy in his tea, and spreads him out upon his toast, and takes him as a relish with his beer," and is supremely happy in his credulous dream. But the truth is flashed on him by one unequivocal circumstance, and then he suffers acutely.

"His compass was broken, his chart was destroyed, his chronometer had stopped; his masts were gone by the board, his anchor was adrift (!) ten thousand leagues away."—P. 371.

But his sister Ruth is presently committed to his charge, and "now that he had somebody to rely upon him, he was stimulated to rely a little more upon himself," and his blundering honesty bears him through. There are some charming scenes between Ruth Pinch, her lover John Westlock, and her simple-hearted brother; and we fancy we see her sticking a sprig of geranium in Tom's button hole, which she is obliged to fasten there, because otherwise "the dear old fellow would be sure to lose it." Tom Pinch teaches us many a quiet and useful lesson of self-denial, cheerfulness, and kind considerateness; but certainly more by his example than by the stilted and scarcely intelligible jargon in which the author sometimes pauses to apostrophize him. Such efforts as the following "to moralize his tale," remind us not a little of the "moral crackers" which he puts into the mouth of his Pecksniff, and teem with every possible fault of composition.

"There are some falsehoods, Tom, on which men mount as on bright wings towards heaven. There are some truths, cold, bitter, taunting truths, wherein your worldly scholars are very apt and punctual, which bind men down to earth with leaden chains. Who would not rather have to fan him in his dying hour, the lightest feather of a falsehood such as thine, than all the quills that have been plucked from the sharp porcupine, reproachful truth, since the world began!"—P. 162.

"Tom, Tom, the man in all this world most confident in his sagacity and shrewdness; the man in all this world most proud of his distrust of other men, and having most to show in gold and silver as the gains belonging to his creed; the meekest

favorer of that wise doctrine, 'every man for himself, and God for us all,' (there being high wisdom in the thought that the eternal Majesty of heaven ever was, or can be, on the side of selfish lust and love!) shall never find—oh never find, be sure of that, the time come home to him when all his wisdom is an idiot's folly weighed against a simple heart."—P. 462.

Jonas Chuzzlewit is scarcely worthy even of the pencil that drew Sikes, and Quilp, and Sir Mulberry Hawk. He is a mean, cowardly villain, with no speck of goodness for the eye to rest on, without one redeeming quality—for even his craven fear cannot awaken the sympathy of the reader. He is too hideous and revolting an incarnation of evil. The account of his misdeeds and evil qualities composes one of the most monstrous dishes on which an indiscriminating public ever "supped full with horrors." Not but that there is often much power in the delineation. Mr. Dickens cannot write feebly: for instance, how much truth is there in the description of the murderer's conduct when he first meets his family after the crime—

"In his secret dread of meeting his household for the first time after what he had done, he lingered at the door on slight pretexes, that they might see him without looking in his face; and left it ajar while he dressed, and called out to have the windows opened, and the pavement watered, that they might become accustomed to his voice."—p. 489.

Nothing can be more clumsy than the plot which leads to the death of this worthy. He thinks that he murdered his father, although he did not; he murders his associate in other villainies to prevent him revealing this fact, which, however, is known to others, and is not true after all. A great deal of machinery is employed to prove him guilty of his father's death, which is instantly disproved; the real murder, however, committed solely to conceal the imaginary one, is brought home to him, and in his vexation and despair he attempts to cut his throat, but has not courage to do it, and immediately after swallows poison.

Revolting as Jonas is, he is not so offensive and intolerable a personage as Sarah Gamp, a midwife, or "monthly nurse," in whom the selfishness and greediness of attendants on the sick are coarsely satirized. Her dialect is doubtless copied very faithfully from nature, but her cue is to entertain the reader with a succession of jests, the point of which always lies in sly allusions to the events and secrets of her particular calling. She seems such a favorite of the author that we meet her at every turn, even in the preface, till we are almost provoked to laugh in spite of our disgust.

The author, as usual, luxuriates in the delineation of vulgar people, and in the imitation of the London dialects and idioms. We have not space to criticize minutely this part of the work; yet we cannot pass without observation, a very uncalled for, and, we will say, unfeeling attack on a respectable class of tradesmen, in the person of Mr. Mould the undertaker. He is satirized, not for any individual vices, but for the unavoidable peculiarities of his indispensable craft. His offences are, that when conducting funerals, he wears a grave, serious countenance, (ah, hypocrite!) although feeling no real sorrow, and that he is happy and comfortable in a thriving business, (ah, selfish wretch!) in spite of the mournful casu-

alties which furnish him employment. Surely Mr. Mould is as well entitled to feel satisfaction in earning his bread honestly and usefully, as the lawyer is, who grows rich because men quarrel and oppress; or the physician, who thrives because they grow ill and die; or the novelist, who amasses wealth and fame, because the rich have their foibles, and the poor their distresses.

We must also find fault with the American scenes, clever and amusing as they are. These chapters are an unaccountable excrescence, and while they add to the bulk, mar the unity and effect of the book as a work of art. They are, in fact, a book of travels dramatized, and not in the best or most candid spirit; they form a new and more pungent edition of the American Notes, but with only the harshest censures distilled over and concentrated.* They have no connexion with the rest of the story, although at first we imagined it might be the intention of the author to trace the influence of selfishness in disfiguring a national character. In a series of figures with ugly names, Diver, Scadder, Chollop, Pogram, and several others, the well known faults of social life in the United States are powerfully, but somewhat too coarsely, and bitterly satirized; and then these personages vanish finally from the stage.

There is much clever description throughout the book, but our limits do not admit of many quotations. We may instance the opening scene and the amusing personification of the wind and its gambols. One paragraph we may quote:—

"It was small tyranny for a respectable wind to go wreaking its vengeance on such poor creatures as the fallen leaves; but this wind, happening to come up with a great heap of them just after venting its humor on the insulted dragon, did so disperse and scatter them, that they fled away, pell-mell, some here, some there, rolling over each other, whirling round and round upon their thin edges, taking frantic flights into the air, and playing all manner of extraordinary gambols in the extremity of their distress. Nor was this enough for its malicious fury; for, not content with driving them abroad, it charged small parties of them, and hunted them into the wheelwright's saw-pit, and below the planks and timbers in the yard, and, scattering the saw-dust in the air, it looked for them underneath, and when it did meet with any, whew! how it drove them on and followed at their heels!" * * * "Being by this time weary of such trifling performances, the boisterous rover hurried away rejoicing, roaming over moor and meadow, hill and flat, until it got out to sea, where it met with other winds similarly disposed, and made a night of it."—Pp. 7, 8.

The storm at page 488 is also finely imagined, and the following extract from the description is an exquisite piece of fancy:—

"The heavy rain beat down the tender branches of vine and jessamine, and trampled on them in its fury; and when the lightning gleamed, it showed the tearful leaves shivering and cowering together at the window, and tapping at it urgently, as if beseeching to be sheltered from the dismal night." P. 489.

* The shrewd suggestion of Mr. Weller, senior, seems not to have been thrown away upon the author himself—"Have a passage ready taken for Merriker; and then let him come back and write a book about the Merrikins, as 'll pay all his expenses and more, if he blows 'em up enough."—*Pickwick Papers*, p. 468.

The following is not a bad imitation of Sterne :—
 "A Dragon man came stamping up the stairs and made a roguish bow to Tom (to whom in common times he would have nodded with a grin) as though he were aware of what had happened, and wished him to perceive it made no difference in him. It was clumsily done; he was a mere waterer of horses; but Tom liked the man for it, and felt it more than going away."—P. 377.

It is however in incident and character that Mr. Dickens excels; we have just room to insert his portrait of Mr. Pecksniff, which is no bad specimen of some of the faults as well as merits of his present style :—

"It has been remarked that Mr. Pecksniff was a moral man. So he was. Perhaps there never was a more moral man than Mr. Pecksniff; especially in his conversation and correspondence. It was once said of him by a homely admirer, that he had a Fortunatus' purse of good sentiments in his inside. In this particular he was like the girl in the fairy tale, except that, if they were not actual diamonds which fell from his lips, they were the very brightest paste, and shone prodigiously. He was a most exemplary man; fuller of virtuous precepts than a copy-book. Some people likened him to a direction post which is always telling the way to a place and never goes there; but these were his enemies—the shadows cast by his brightness; that was all. His very throat was moral. You saw a good deal of it. You looked over a very low fence of white cravat, (whereof no man had ever beheld the tie, for he fastened it behind,) and there it lay, a valley between two jutting heights of collar, serene and whiskerless before you. It seemed to say on the part of Mr. Pecksniff, 'There is no deception, ladies and gentlemen; all is peace: a holy calm pervades me.' So did his hair, just grizzled with an iron-gray, which was all brushed off his forehead, and stood bolt upright, or slightly drooped in kindred action with his heavy eyelids. So did his person, which was sleek though free from corpulency. So did his manner, which was soft and oily. In a word, even his plain black suit, and state of widower, and dangling double eye-glass, all tended to the same purpose, and cried aloud, 'Behold the moral Pecksniff.'"—P. 10.

We said the faults of the present style of Mr. Dickens; and certainly no one can read even a single chapter of Martin Chuzzlewit without perceiving a very striking declension from the purity and unassuming excellence which marked his earlier compositions. This is apparent, first, in various impurities of expression, and even some gross offences against the English language. For instance, many words, in themselves good and classical, are used in such a collocation, that to make any sense of them at all, we must suppose that the author has imported some new meaning of them from America during his transatlantic trip. Thus, we have *impracticable* nightcaps, *impossible* tables and *exploded* chests of drawers, *mad* closets, *inscrutable* harpsichords, *undeniable* chins, *highly geological* home-made cakes, *remote suggestions* of tobacco lingering within a spittoon, and the *recesses and vacations* of a toothpick. Then again we have the pages bristling over with various strong words employed in their improper colloquial usage—such as *tremendous*, *terrible*, *monstrous*, *desperate*, *frightful*, *awful*, *horrid*, *horrible*, *unearthly*, *appalling*, *dreadful*, *enormous*. "No doubt a *tremendous* fellow to get through his

work." "It was a *monstrous* comfortable circumstance." "Martin was *monstrous* well-disposed to regard his position in that light," and so on. It is surely improper for an author of established reputation to give his sanction to this vicious habit of speaking, which naturally leads to an exaggerated way of viewing trivial things; and he ought not to degrade these important words from their appropriate functions to the performance of the meanest services in a light and laughing page. But he goes further, and offends grievously against the rules of grammar; catching the infection from his own actors, he adopts their forms of expression, and offends the shade of Lindley Murray with such barbarisms as "It had not been painted or papered, had n't Todgers", past the memory of man." "She was the most artless creature, was the youngest Miss Pecksniff." "Nature played them off against each other; they had no hand in it, the two Miss Pecksniffs." Indeed, Mr. Dickens seems often purposely to cast his language into the mould of the vulgar characters he represents, and as it were, to fondle their phrases, idioms, and ideas. He makes occasional use of the interjections "bless you!" "heaven knows!" &c. He speaks of a place where "black beetles got mouldy and had the shine taken out of their backs by envious mildew;" of a grimace of Master Bailey as "an easy, horse-fleshy, turfy, sort of thing to do;" of a boorish action at a Yankee table as having "a juiciness about it that might have sickened a scavenger," and thus describes the Miss Pecksniffs' contrast of character :—

"To behold each damsel in the very admiration of her sister, setting up in business for herself on an entirely different principle, and announcing no connexion with over the way, and if the quality of goods at that establishment don't please you, you are respectfully invited to favor me with a call."—P. 10.

Slang, also, seems to come naturally to his lips, for he founds a cumbrous joke in the first chapter on the words *my uncle*, and gives his readers credit for knowing them to be slang for the pawnbroker; he describes some young ladies as having, "in the figurative language of the day, a great amount of steam to dispose of;" and Mr. Pecksniff as getting a bruise "on what is called by fancy gentlemen the 'bark' on his shin;" and the head of one of his American heroes as "shaking involuntarily, as if it would have said, in the vulgar tongue, on its own account, no go."

It is impossible not to contrast this style with that of Sir Walter Scott, who, in the homeliest scenes, and amidst the lowest company, never allows us to forget the difference between the gentleman who is narrating and the persons of whom he tells, and whose own allusions, similes, and even jokes, are refreshing and instructive, because deeply imbued with his rich store of historical and literary knowledge.

The deterioration of style is further observable in the descriptions. Mr. Dickens was always famed for giving life to inanimate scenes, and catching the little characteristic traits of conduct and character; but he now carries minute description to an excess that sometimes, indeed, degenerates into mere extravagance—his interiors are often inventories rather than pictures. Here is one :—

"The drawing-room at Todgers' was out of the common style; so much so indeed, that you would hardly have taken it to be a drawing-room, unless you were told so by some one who was in the se-

erest. It was floor-clothed all over, and the ceiling, including a great beam in the centre, was papered. Besides the three little windows, with seats in them, commanding the opposite archway, there was another window looking point blank, without any compromise at all about it, into Jinkins' bed-room; and high up, all along one side of the wall, was a strip of panes of glass, two deep, giving light to the staircase. There were the oddest closets possible, with little casements in them like eight day clocks, lurking in the wainscot, and taking the shape of the stairs, and the very door itself (which was painted black) had two great glass eyes in its forehead with an inquisitive green pupil in the middle of each."—P. 109.

Mr. Fip's office is portrayed with similar minuteness, and the author especially chronicles—

"A great black sprawling splash upon the floor, in one corner, as if some old clerk had cut his throat three years ago, and had let out ink instead of blood."—P. 457.

In another place are pointed out—

"Very mountebanks of two-pronged forks, which seemed to be trying how far asunder they could possibly stretch their legs, without converting themselves into double the number of iron tooth-picks."—P. 461.

After the interior of a tavern has been elaborately described, the window is thus disposed of:—

"It was a little below the pavement, and abutted close upon it, so that passengers grated on the window-panes with their buttons, and scraped it with their baskets; and fearful boys suddenly coming between a thoughtful guest and the light, derided him, or put out their tongues as if he were a physician, or made white knobs on the end of their noses by flattening the same against the glass, and vanished awfully like spectres."—P. 412.

The frequent recurrence of such ludicrous minuteness in the trivial descriptive details induces us to compare Mr. Dickens' style of delineation to a photographic landscape. There, everything within the field of view is copied with unflinching but mechanical fidelity. Not a leaf, or stone, or nail is wanting, or out of place; the very bird is arrested as it flits across the sky. But, then, the imitating agent takes exactly the same pains with the dunghill and the gutter, as with the palace and the forest tree; and it is as busy with the latchet of the shoe, and the pattern of the waistcoat, as with the noble features of the human face. Mr. Dickens' pencil is often as faithful, and not more discriminating. He lavishes as much attention on what is trivial or useless as on the more important parts of the picture, as if he could not help painting everything with equal exactness. Neglecting the effective outline, the charm of harmonious grouping, and of contrasted light and shade, he crowds his canvases with figures, and notes the very hat, and neckcloth, and coat buttons of each; dwelling upon his city scenes, whether connected or not with the business in hand, till he has enumerated the tables and chairs, and even counted the panes of glass. There is no judicious perspective, and withdrawing from view of disagreeable particulars. We stand as close to the most offensive object, and see its details as nakedly, as if it was the most agreeable. Thus, when Tigg is murdered by Jonas, the author affects not to describe the actual deed of blood, but, in the reflections of the murderer afterwards, he thrusts on us the most revolting details. He paints the criminal "in fancy approaching the dead body, and start-

ling the very flies that were thickly sprinkled all over it, like heaps of dried currants."—P. 578.

And again, Jonas sees in imagination, "the body of a murdered man. In one thick, solitary spot, it lay among the last years' leaves of oak and beech, just as it had fallen headlong down. Sopping and soaking in among the leaves that formed its pillow; oozing down into the boggy ground, as if to cover itself from human sight; forcing its way between and through the curling leaves—as if these senseless things rejected and foreswore it, and were coiled up in abhorrence—went a dark, dark stain, that dyed and scented the whole summer night from earth to heaven."—P. 541.

Mr. Dickens never trusts to a vigorous sketch, or a few characteristic touches; he accomplishes his purpose by minute description and copious dialogue, and leaves no work for the imagination of the reader. This leads us to observe, that the vast popularity of these works may, perhaps, in some degree be owing to the indolence of the reading public, and that the very clever "illustrations" which accompany them all, may have contributed greatly to their success. No reader need ever task his mind's eye to form a picture corresponding to the full description; he has but to turn the page, and there stands the Pickwick, Pecksniff, or Tom Pinch, embodied in his hand, and kindly saving him the labor of thought.

It is not much to be wondered at that, in such long works, with his fondness for minute delineation, and with his limited range of scenery and class of actors, Mr. Dickens should be apt, in describing places and the every-day incidents of life, to repeat himself. We have much sameness in many of the street scenes in London, and in the interiors of taverns and solicitors' offices; and the wretched effects of intoxication form a very frequent subject for the pencil. In this work we have the drunken humors of Jonas, and Chevy Slime, and Mr. Pecksniff, and Mrs. Gamp, and more if we could recall them. There is a more amusing instance of repetition—for the pleasant diversion of kissing is very circumstantially depicted no less than nine times, perhaps oftener: we have Martin kissing Mary in the park; Mark kissing Mrs. Lupin; Pecksniff kissing Mary; Martin kissing Mary in Pecksniff's parlor; John Westlock kissing Ruth; Martin kissing Mary the third time; and so on.

The deterioration of style extends even to what are intended as the lighter graces of the composition. We could not have supposed it possible that Mr. Dickens could have ornamented any work of his with such pieces of wit, such miserable puns, as he has thickly scattered through *Martin Chuzzlewit*. As when he tells us that "Mr. Pecksniff was a *land-surveyor* on a pretty extensive scale, as an extensive prospect was stretched out before the windows of his house;" and facetiously observes, in sketching Mr. Montague Tigg, "in respect of his dress, he could hardly be said to be in any *extremities*, as his fingers were a long way out of his gloves, and the soles of his feet were at an inconvenient distance from the upper leather of his shoes;" and talks of a lady with "what might be termed an *exciseable face*, or one in which starch and vinegar were decidedly employed." These examples, however, are quite eclipsed by this extravagant piece of silliness in describing Mr. Moddle:—

"He is very frail and tearful, for being aware

that a shepherd's mission was to pipe to his flocks, and that a boatswain's mission was to pipe all hands, and that one man's mission was to be a paid piper, and another man's mission was to pay the piper; so he had got it into his head that his own peculiar mission was to pipe his eye."—P. 382.

There is, in fact, a continual straining after merriment and facetious remark, as if the natural buoyancy and fun of the writer had been unable to keep pace with the frequently recurring demands on his pen. He has recourse sometimes to irony; but that he fails in that figure of speech will be evident from the following not unfair specimens:—

"The great American eagle, which is always airing itself sky-high in purest ether, and never—no, never, never, never tumbles down with draggled wings into the mud."—P. 385.

"The great discovery made by the ancient philosopher for securing health, riches, and wisdom; the infallibility of which has been for generations verified by the enormous fortunes constantly amassed by chimney-sweepers and other persons who get up early and go to bed betimes."

Our quotations have shown, what might be verified by fifty more, that many parts of this work are composed in the most careless and even slovenly manner; bearing evident marks of having been written, as it were, at a canter, by a man of consummate ability, with great exuberance of spirits, but sometimes affecting an unnatural vivacity that he may hide an occasional flagging, perfectly familiar with all the habits and modes of speech of certain classes of society, well able to catch with fidelity the tone of dialogue appropriate to various situations, with good intentions in the main, but rendered confident, careless, and somewhat presumptuous, by the unexampled brilliancy of his success.

We must now glance at the moral tendency of these works. For it ought never to be forgotten that the able novelist exercises great power in moulding the feelings and judgment of his readers. He is like the physician in the Eastern tale, whose royal master disliked the disagreeable process of swallowing drugs, and who accordingly fell upon the expedient of administering medicine to him in the handle of a racket. As the medicine, unknown to the patient, entered the pores of his body while his hand was heated by exercise, so instruction and health may flow into the mind when it seeks only to relax itself by congenial amusement. But, in the hands of a careless or unskilful physician, the same hours of relaxation may become the occasion of impairing its vigor and planting disease in its constitution. A good moralist would surely tell us, that an intimate acquaintance with the haunts of profligacy and crime, and a minute knowledge of the habits of life, modes of speech, and turns of thought of the degraded, the vicious, and the brutal, must be injurious to a high tone of virtuous feeling. The judicious parent will not allow his children to mix with persons of vicious habits, or of mean and dishonest propensities. The youth deems it a high privilege to be admitted to the society of the well-bred, the pure, the high-minded. Our moral health is dependent on the moral atmosphere we breathe. The novels are just an artificial experience, and the well-drawn character becomes a kind of companion. With whom, then, does Mr. Dickens bring us into close and familiar contact? Lackeys, stable-boys, thieves, swindlers, drunkards, gamblers, and mur-

derers: and where is his scene most frequently laid, but in their haunts of vulgar revelry or dens of profligacy and crime? Such scenes and characters he dwells upon, until we are intimate with all the details. It has been attempted as an apology by his admirers, that, besides the ability with which he writes, and the witty humor of his characters, he paints very delicately, and withdraws what is offensive, so that the most sensitive cheek need not blush over his writings. We do not accept this apology. Are not the gross language and revolting manners of the vicious, one of the most useful safeguards to virtue? Shall we say that "vice loses half its evil by losing all its grossness?" Is it not rather our daily experience that we more easily catch the tone and tolerate the vices of those with whom we associate, if they are refined and polite as well as witty and entertaining? Shall we then applaud him who takes away our safeguard, and leads us habitually to think of vice without the repulsiveness that should ever belong to it?

We do not say that the chief evil to be apprehended from Mr. Dickens' works is, that they will teach people, at least of the higher ranks, to commit crimes. Yet it is not impossible that they may give suggestions to vices. There is a story of a Roman Catholic hostler, who, on going one day to confession, was asked by the priest if he ever greased his horses' teeth to prevent them eating their corn. He answered that he never did; but the next time he confessed himself this was among the number of his sins. On the priest expressing his astonishment, the poor fellow replied, "I never thought of it till your worship put it in my head." Now, in the same way, we will not undertake to say that some may not have imbibed a lesson of callous dissimulation from Sir John Chester, or learned to "pass the rosy" with Dick Swiveller, or to go a "fogle-hunting" with the Artful Dodger. The chief evil, however, undoubtedly is, that the perceptions of moral purity are blunted, exactly as when we mix in company with profligate persons of wit and agreeable manners; the delicate sense of right and wrong, and the instinctive feeling of honor and propriety are lost; the blush ceases to rise spontaneously on the female cheek at a coarse jest or depraved allusion; and vice can be made a subject of merriment in place of causing sorrow and indignation. The voice of true wisdom will tell us to be averse to all such objects of contemplation as abound in these volumes, to forbid our imaginations to dwell on what is degraded and impure, however conveyed, and rather to occupy our thoughts with habitual study of the qualities and actions of the noble and pious, which will enable us to imbibe their spirit and follow their example.

In estimating the probable effects of these writings of Mr. Dickens, we must remember that, in the shape of plays, they have been represented at most of the theatres in the country. In this process of transmutation the better and more sober parts necessarily disappear, and the striking figures, amusing low life, smart vulgar conversation, and broad farce, are naturally preserved with care. It is not therefore surprising to find, in the drama of Martin Chuzzlewit, that Master Bailey, with his cockneyisms, draws the chief attention; and that the tipsy quarrel between Mrs. Gamp and Betsy Prig is the most effective scene in the piece. The higher ranks thus laugh publicly at

the scenes of most hurtful tendency; and it is these principally which are made widely known to the lower classes.

One of the most remarkable effects of these works has been the singular patronage and favor which has marked the reception of those slang forms of expression, of which Mr. Dickens has presented us with so copious a variety, that from his writings alone we might compile grammar, dictionary, and phrase-book, with a treatise on their Doric, Ionic, and more purely Attic idioms. Even in polite circles, and sometimes in the mouths of the fair sex, Mr. Weller's flowers of rhetoric, and Dick Swiveller's graces of speech, might be heard frequently quoted with zest; and still these vulgarisms, this "well of English *sore-defiled*," threatens to infect the tone of conversation, and to color the language of social life. No one who reflects on the nature of this sort of dialect can fail to regret that it should be spread abroad and come into vogue, as it thus seems likely to do. Mr. Dickens has himself endeavored to convey to us, as the result of his observations on some classes of society in America, that corrupt phraseology is intimately associated with degeneracy of character. Slang differs widely from the broad Scotch which abounds so much in the Waverly Novels. That is the language of a whole people, in which the remnants of a fine old tongue are preserved, and linger amidst the more modern English, like the grand old pine trees of the country, still towering nobly above the tame cultivation which has crept in around them. It differs widely, too, from the provincial dialects of England, which arose insensibly, are spoken unconsciously, and are often in part due to a pronunciation moulded by climate, or conformation of the organs of speech. But slang arose in towns, amid thieves and gamblers, who had need of an obscure phraseology; it was adopted by those who wished to be thought initiated into secrets not known to every one; it came to be used as a cheap substitute for wit; but wherever it goes, it bears the stamp of its nativity, and an impress of crime, concealment, and baseness. The man of pure and honorable feeling cannot use it; and its spread will be an index of the departure of these qualities from society.

The mention of the Waverly Novels and their broad Scottish dialect, leads unavoidably to the remark, that, unlike the author of these matchless productions, Mr. Dickens makes his low characters almost always *vulgar*. It is not easy to define vulgarity, but every one can feel it; and we know that Edie Ochiltree, Cuddie Headrigg, Bailie Nicol Jarvie, and Dominic Sampson are not vulgar, in spite of their accent, language, and station; neither are Jeanie Deans, or Meg Merriees, or the Mucklebackits; and while the author draws them with perfect truth, he often conveys through their mouths lessons of the greatest moral elevation. Every reader must have felt how much otherwise it is with Mr. Dickens.

In the next place, the good characters in Mr. Dickens' novels do not seem to have a wholesome moral tendency. The reason is, that many of them—all the author's favorites—exhibit an excellence flowing from constitution and temperament, and not from the influence of moral or religious motive. They act from impulse, not from principle. They present no struggle of contending passions; they are instinctively incapable of evil; they are therefore not constituted like other

human beings; and do not feel the force of temptation as it assails our less perfect breasts. It is this that makes them unreal,

"Faultless monsters, that the world ne'er saw."

This is the true meaning of "the simple heart," which Mr. Dickens so perpetually eulogizes. Indeed, they often degenerate into simpletons, sometimes into mere idiots. Such characters are uninstructional; for in contemplating them we lose sight of the great fact of the corruption of human nature; from which it follows that virtue, whether in the Christian or the heathen breast, consists in the triumph of good principle over evil propensity, and the victory of moral and religious motives over the allurements of temptation. Even heathen moralists have delighted to portray the passions as fierce and impure animals, bridled and tamed by conscience. The best dramatists and novelists have taken many a subject from this conflict; and have represented at one time the temporary triumph of the baser motive; at another, the conquest of good resolution over severe assaults; and again, the firm adherence to duty through a long course of suffering and difficult exertion. They are uninstructional, because the absence of high principle, as the spring of action, prevents the reader, especially the young, from scanning and analyzing motives, duties, and passions; and instead of being in that way stimulated to earnest thought and self-examination, he is lulled into a pleasing indifference and frivolity of mind.

Another error is the undue prominence given to good temper and kindness, which are constantly made substitutes for all other virtues, and an atonement for the want of them; while a defect in these good qualities is the signal for instant condemnation, and the charge of hypocrisy. It is unfortunate also, that Mr. Dickens so frequently represents persons with pretensions to virtue and piety as mere rogues and hypocrites, and never depicts any whose station as clergymen, or reputation for piety, is consistently adorned and verified. It is not surprising if he has thus created in the minds of some an impression that he holds the claims of religion itself in contempt.

But, indeed, the mere omission of religion in his good characters and sentimental passages is sufficiently striking. We are no admirers of religious novels, nor do we think them a good vehicle for advice on that solemn subject; and we have no fancy for those written expressly to expound or argue a particular set of doctrines—for such as the "The Anglo-Catholic Family," or the "Dis-senter's Progress into the Bosom of the Church." But if the value of religion is felt at all by the author of a tale, he can hardly help letting us see it as the spring of action in his good characters, or, at least, as furnishing his own standard of right and wrong in his judgments and views of things. But surely, if at no other time, the omission must be culpable when one so capable as Mr. Dickens of moving the feelings, leads us into the most solemn scenes, and takes us to the death-bed of the young, the fair, and the good, and spares no art to "ope the sacred source of sympathetic tears." When our hearts are touched, it is not right, and to a well constituted mind it is painful, to leave us with a few vague sentiments scarcely even of natural religion, and a picturesque sketch perhaps of a Bible in the background, but with no reference to the revelation it

contains, and to those truths which furnish the only true ground of hope to the dying, and of consolation to the bereaved.

We cannot but sometimes contrast the tone of Mr. Dickens' purely sentimental passages with that of Sir Walter Scott on similar occasions, and the stilted pomp with which the former often parades a flaunting rag of threadbare morality, with the quiet and graceful ease with which the latter points out and enforces a useful lesson. Indeed, it seems unavoidable that the high standard which is afforded by the novels of Scott should be perpetually referred to for trying all his followers in the same path of literature; and, surely, when it is remembered how eminently his romances are distinguished by shrewd practical good sense, as well as by pure feeling and correct moral tone, by an unaffected and manly simplicity of style, notwithstanding the rich variety of knowledge, overflowing, not displayed, in every page, he is well entitled to be regarded as the guide of the critic as well as the model of succeeding novelists.

Lastly, the form of publication of Mr. Dickens' works must be attended with bad consequences. The reading of a novel is not now the undertaking it once was, a thing to be done occasionally on a holiday and almost by stealth. The monthly number comes in so winningly, with methodical punctuality, and with so moderate an amount at a time, that novel-reading becomes a sort of stated occupation, and not to have seen the last part of *Martin Chuzzlewit* is about as irregular as not to have balanced your books. Useful as a certain amount of novel reading may be, this is not the right way to indulge in it. It is not a mere healthy recreation, like a match at cricket, a lively conversation, or a game at backgammon. It throws us into a state of unreal excitement, a trance, or dream, which we should be allowed to dream out, and then be sent back to the atmosphere of reality again, cured by our brief surfeit of the desire to indulge again soon in the same delirium of feverish interest. But now our dreams are mingled with our daily business; the school-boy hurries over his lessons to get to the new number of Dickens, or Lever, or Warren, and these cheap and abundant publications absorb the energies which, after the daily task, might be usefully employed in the search after wholesome knowledge.*

It is plain, also, that the form of publication must tend greatly to increase any pernicious influence in these or other similar works. For the characters and incidents are kept long before the mind, and we have time to become very familiar with them, as we wait and long to know how Sam Weller gave evidence in a court of justice; how Jonas Chuzzlewit accomplished the murder of Montague Tigg; or how Dick Swiveller played at cribbage with the Marchioness, or discoursed the affairs of the Glorious Apollo with Mr. Chucker. The impressions are not allowed to be effaced; they are renewed at short intervals, till the whole story, and actors, and moral, wind themselves into the mind, and produce a full and

lasting influence; while the jokes and idioms, and slang phrases of the successive numbers are repeated and dwelt on in the intervals, until, by being gradually stored up in the memory, they at length tinge the language of ordinary conversation. It is scarcely necessary to add, how very injurious to the novel, as a work of art, this mode of publication must be, and the opportunity it gives to the author to know the sentiments of the public, and to them to interfere with the conduct of the tale. Mr. Dickens has told us that while the *Old Curiosity Shop* was in course of publication, he had hundreds of letters, chiefly from ladies, beseeching him to spare little Nell, which, finding he had such a hold on their sympathies, he very properly refused to do.

We have reserved for the conclusion of our review the "*Christmas Carol*" and the "*Chimes*," because they belong to a different class of compositions, and because we do not wish to part from an author whose genius has so often delighted us, with these somewhat austere remarks. The former little story abounds with mannerism, but with the best as well as the less pleasing characteristics of the author. We have, no doubt, his carelessness and incorrectness of style—but then all his copiousness and variety;—his tendency to overstrained and extravagant imagery—but then, his unrivalled exuberance of life and animation; his occasional petulant sneers at religious people and the strict observance of Sunday—but then, his own touching mode of awakening sympathy with the joys and sorrows of the poor. We had at one time marked for grave animadversion some instances of bad taste, and the moral process by which *Old Scrooge* is converted at once from an *Arthur Grudge* into a *Brother Cheeryble*. But the Christmas dinner of *Tom Cratchit* and his family rose to recollection, and the spirit of *Tiny Tim*, "who did *not* die after all," sealed our lips; a hundred bright, sparkling, fantastic images crowded into the memory; we could see the sweeps pelting each other with snow-balls, laughing heartily when they hit, and laughing still more heartily when they missed, and the shops with their tempting stores, and the game of romps at the nephew's in the evening; and then *Old Scrooge* himself, after sending the turkey to *Bob Cratchit's*—seemed quietly to take the pen from our unresisting fingers.

But what bells are these swinging, now in bright sunshine and now in deep shade, greeting the New Year with a half-glad half-melancholy peal! The *Chimes*;—telling, however, no "*Goblin Story*," but one very real, full of truth, and regarding sober flesh and blood. Their sound is a pleasant one; for in this little tale there is a great deal reminding us of the best parts of the *Pickwick Papers*, its clear portraiture, and its effective satire. There is all the author's wonted vivid minuteness of description, which does not overlook the speckled spiders in the belfrey, or the brass toasting-fork in *Tugby's* parlor, which "spread out its idle fingers as if it wanted to be measured for a glove." There are gentle touches of nature that bring tears to the eye, and dismal strains that thrill through the heart. These last are conveyed in a dream, which should not be here, because the idea is a plagiarism from the *Christmas Carol*, and are communicated by serial and goblin personages, who are of no particular use. In this dream is revealed to *Toby Veck*, the simple-hearted ticket-porter, a sketch of what *might have been* the

* The view taken above is confirmed by a remark of Dr. Arnold, (*Life*, vol. ii., p. 159; and *Sermons*, vol. iv., 39—41;) that the increase of frivolity and childishness, and the decrease of manly thoughtfulness, which he had observed with pain in the great school under his charge, was owing to the periodical form given to works of amusement, (he mentions *Pickwick* and *Nicholas Nickleby* as instances,) harmless, perhaps, in themselves.

fate of his daughter, but what is every day in sad reality—the hard life and final desperation of the disregarded and unpitied poor:—

“Such work, such work,” says the spirit of Lillian, “so many hours, so many days, so many long, long nights of hopeless, cheerless, never-ending work—not to heap up riches, not to live grandly and gaily, not to live upon enough, however coarse, but to earn bare bread, to scrape together just enough to toil upon, and want upon, and keep alive in us the consciousness of our hard fate.”

The end is crime, and the broken heart, and the fatal plunge. We cannot, however, forgive the author for the cruelty of inflicting this dream on poor Toby Veck, who could certainly not distinguish accurately between what *might have been* and what *might be*, and who so well deserved rather a bright peep into futurity. The object of the whole piece is to satirize those in authority, who, by unfeeling harshness, goad the poor to crime, and then “abandon the vile, nor trace the unfenced precipices by which they fell from good,” and to awaken in the breast of the reader greater sympathy with the sufferings, and greater forbearance towards the vices, of the wretched. Such being evidently the drift of the book, we do not care to criticize its style minutely, or to inquire whether its views are not a little one-sided, and the sentimental passages a little vague and rhapsodical; it is enough that there is a tendency to awaken those emotions of kindness towards the poor which are now too feebly, and can never be too strongly felt, by the richer classes; and seeing him engaged in so good a work, we heartily wish him success.

From Fraser's Magazine.

A SPRING CAROL.

THE spring's free sunshine falleth
Like balm upon the heart:
And care and fear, dull shadows!
Are hastening to depart.
Oh! time of resurrection
From sadness unto bliss;
From death, decay, and silence,
To loveliness like this.
Oh! season of rejoicing,
That fills my heart and brain
With visions such as never,
Methought, should come again.
Oh! blessed time, renewing
The light that childhood wore;
Till thought, and hope, and feeling,
Grow earnest as of yore!

Though youth has faded from me,
Perchance before its time,
Like a flower, pale and blighted,
Amid its gayest prime;
Though now I value lightly
The noisy joys of life,
And deem its vain ambition
A mad and useless strife,
Thank God! the fount of feeling
Hath deep, exhaustless springs,
And the love once poured so freely
On frail and worldly things,
Is now more freely given
To the blossoms of the sod,

To the trees, whose leafy branches
Are whispering of God.

The young green lime bends o'er me,
Through its boughs the sunbeams pass,
Making here and there bright islands
'Mid the shadows on the grass.
The butterfly is wending
Its way from flower to flower,
Like a freed and happy spirit—
Meet emblem of such hour!
Loud sings the hidden cuckoo
In his bower of leaves all day,
And many a voice of gladness
Is answering his lay.
The rose is opening slowly,
The lilac's scented cones
Are musical till nightfall,
With the wild-bees' drowsy tones.

The oaks, moss-grown and aged,
How beautiful they seem;
With glory wrapt about them,
Like the glory of a dream!
How lovingly the sunshine
Clings round the tufts of green;
And all is fair and joyful
As if winter had not been!
Far off, the furze is blooming,
With spaces, far and near,
Of lawn, where now are straying
Large herds of graceful deer;
And turfey pathways wending
Through sunshine and through shade,
And wooded hills enfolding
This lovely forest glade.

I turn, and see the fruit-trees
With blossoms pink and white,
Like gems of Eastern story
In the gardens of delight;
And strewn like fairy favors
Are flowers of every hue
Among the grasses shining,
Red, yellow, white and blue.
The pines, so tall and regal,
Their shadowy branches wave,
Like plume-crowned pillars standing
Round a mighty monarch's grave.
Less sorrowful than stately,
Those dark unbending trees
Give out a silv'ry murmur
To the gentle evening breeze.

In this season of life's triumph
Man's spirit hath a share,
It can see the grave unclosing,
Yet feel all ends not there.
It smiles to see the conquest
Of beauty o'er decay,
With the merry lark up-soaring
It greets the dawning day.
Not vainly by such gladness
The poet's heart is stirred,
These sights and sounds not vainly
By him are seen and heard.
All fears that crowded o'er him,
Like clouds asunder roll,
Spring's hope and joyful promise
Sink deep into his soul.

From Chambers' Journal.

"TALES OF THE COLONIES."

EIGHTEEN months ago, we noticed a work under the above title, of which it would be difficult to say whether it abounded more in the spirit-stirring scenes usually found in fiction, or in sound views respecting emigration to, and settlement in, perhaps the finest of the Australian colonies—Van Diemen's Land. As to a great extent the adventures of a settler—an English farmer—in that distant colony, who, after undergoing many mishaps, while the country was still in a crude condition, had lived to reap the reward of his perseverance, such a work could not fail to be very generally acceptable; and we are glad to know that it has been so much so as to pass already into a third edition. Desirous of rendering his work more extensively available, the author has judiciously issued it in a single volume;* and as a copy of this cheap edition has been placed under our notice, we take leave to bring it once more before our readers.

Having on the former occasion described the contents of the book at considerable length, it is now unnecessary to say more on that subject. Being desirous, however, of conveying an idea of the author's powers of narration, we may offer the following extract, which refers to a state of society in the colony, now, we believe, gone.

THE BUSHRANGER.

In crossing the country one day, and at a distance from any habitation, Mr. Thornley, the settler, to his surprise and fear beheld at a short distance approaching him a noted bushranger, known by the name of "the Gipsy," who had latterly, with a band of associates, become the dread of the colony. He was a tall, well-made man, one apparently above the ordinary character of convicts, and whom it was distressing to see in such a situation. The parties approached each other with mutual distrust. Thornley knew he had a desperate character to deal with, and pointed his gun at him; but the bushranger seemed desirous of a parley, and after a few words, says the writer, he laid his gun quietly on the grass, and then passed round me, and sat down at a few yards' distance, so that I was between him and his weapon. "Well, Mr. Thornley," said he, "will that do? You see I am now unarmed. I don't ask you to do the same, because I cannot expect you to trust to me, but the truth is, I want to have a little talk with you. I have something on my mind which weighs heavy on me, and whom to speak to I do not know. I know your character, and that you have never been hard on your government men, as some are. At any rate, speak to some one I must. Are you inclined to listen to me?"

I was exceedingly moved at this unexpected appeal to me at such a time and in such a place. There was no sound, and no object save ourselves, to disturb the vast solitude of the wilderness. Below us flowed the Clyde, beneath an abrupt precipice; around were undulating hills, almost bare of trees; in the distance towered the snowy mountain which formed the boundary to the landscape. I looked at my companion doubtfully; for I had heard so many stories of the treachery of the bushrangers, that I feared for a moment that this acting might only be a trick to throw me off my

*London: Smith, Elder, and Co. 1846.

guard. Besides, this was the very man whom I knew to have been at the head of the party of bushrangers who had been captured at the Great Lake.

He observed the doubt and hesitation which were expressed in my looks, and pointed to his gun which was on the other side of me.

"What more can I do," said he, "to convince you that I meditate neither violence nor treachery against you? Indeed, when you know my purpose, you will see that they would defeat my own object."

"What is your purpose, then? Tell me at once—are you one of the late party of bushrangers who have done such mischief in the island?"

"I am: and more than that, I am—or rather was—their leader. I planned the escape from Macquarie harbor; and it was I who kept them together, and made them understand their strength, and how to use it. But that's nothing now. I do not want to talk to you about that. But I tell you who and what I am, that you may see I have no disguise with you; because I have a great favor—a very great favor—to ask of you; and if I can obtain it from you on no other terms, I am almost inclined to say, take me to camp as your prisoner, and let the capture of the Gipsy—ah! I see you know that name, and the terror it has given to the merciless wretches who pursue me—I say, let the capture of the Gipsy, and his death, if you will—for it must come to that at last—be the price of the favor that I have to beg of you!"

"Speak on, my man," I said: "you have done some ill deeds, but this is not the time to taunt you with them. What do you want of me! and if it is anything that an honest man can do, I promise you beforehand that I will do it."

"You will!—but you do not know it yet. Now listen to me. Perhaps you do not know that I have been in the colony for ten years. I was a lifer. It's bad that; better hang a man at once than punish him for life: there ought to be a prospect of an end to suffering; then the man can look forward to something; he would have hope left. But never mind that. I only speak of it because I believe it was the feeling of despair that first led me wrong, and drove me from bad to worse. Shortly after my landing I was assigned to a very good master. There were not many settlers then, and we did not know so much of the country as we do now. As I was handy in many things, and able to earn money, I soon got my liberty on the old condition; that is of paying so much a-week to my master. That trick is not played now, but it was then, and by some of the big ones too. However, all I cared for was my liberty, and I was glad enough to get that for seven shillings a-week. But still I was a government prisoner, and that galled me; for I knew I was liable to lose my license at the caprice of my master, and to be called into government employ. Besides, I got acquainted with a young woman, and married her, and then I felt the bitterness of slavery worse than ever; for I was attached to her sincerely, and I could not contemplate the chance of parting from her without pain. So about three years after I had been in this way, I made an attempt to escape with her in a vessel that was sailing for England. It was a mad scheme, I know; but what will not a man risk for his liberty!"

"What led you to think of going back to England! What were you sent out for?"

"I have no reason to care for telling the truth. I was one of a gang of poachers in Herefordshire, and on a certain night we were surprised by the keepers, and somehow, I don't know how, we came to blows; and the long and the short of it is, one of the keepers was killed; and there's the truth of it."

"And you were tried for the murder?" "I and two others were; and one was hanged, and I and my mate were transported for life." "Well, the less that's said about that the better; now go on with your story; but let me know what it is you would have me do for you."

"I'll come to that presently; but I must tell you something about my story, or you will not understand me. I was discovered in the vessel, concealed among the casks, by the searching party, and brought on shore with my wife; and you know, I suppose, that the punishment is death. But Colonel Davey—he was governor then—let me off; but I was condemned to work in chains in government employ. This was a horrid life, and I determined not to stand it. There were one or two others in the chain-gang all ready for a start into the bush, if they had any one to plan for them. I was always a good one at head-work, and it was not long before I contrived one night to get rid of our fetters. There were three others besides myself. We got on the top of the wall very cleverly, and first one dropped down, (it was as dark as pitch, and we could not see what became of him,) then another dropped, and then the third. Not a word was spoken. I was the last, and glad enough was I when I felt myself sliding down the rope outside the yard. But I had to grin on the other side of my mouth when I came to the bottom. One of the sneaks whom I had trusted had betrayed us, and I found myself in the arms of two constables, who grasped me tightly. I gave one of them a sickener, and could have easily managed the other, but he gave the alarm, and then lots of others sprang up, and lights and soldiers appeared. I was overpowered by so many. They bound my arms, and then I was tried for the attempt to escape, and the assault on the constable, and condemned to Macquarie harbor for life.

"I have not told you that my wife brought me a child. It is now seven years old. I loved that child, Mr. Thorley, more than a parent usually loves his child. It was all in all to me. It was the only bright thing that I had to look upon. When I was sentenced to Macquarie harbor for life, it would have been a mercy to put me to death. I should have put myself to death, if it had not been for the thought of that little girl. Well, sir, I will not say more about that. When a man takes to the bush, and has done what I have done, he is thought to be a monster without feeling or affection. But people don't understand us. There is no man, sir, depend upon it, so bad that he has not some good in him; and I have had some experience: for I have seen the worst of us—the very worst—in the most miserable of all conditions—for that Macquarie harbor is a real hell upon earth! There is no time to tell you about the hardships and the miseries which the prisoners suffer in that horrible place—it soon kills them. But my greatest misery was being deprived of my little girl—my plaything—my darling—my life! I had not been at Macquarie harbor a month, before news came that my wife was dead. I'll tell you the

truth, sir: attached to her as I was, I was rather glad than sorry for it. I could not bear the thought of her falling into anybody else's hands; and as our separation was now absolutely and hopelessly forever—it is the truth—I was rather glad than sorry when I heard of her death. But my poor little child! I thought of her night and day, wondering and thinking what would become of her! I could think of nothing else. At last my thoughts began to turn to the possibility of escaping from Macquarie harbor, desperate as the attempt appeared; for, to cross the bush without arms, and without provisions, exposed to the attacks of the natives, seemed all but an impossibility. But almost anything may be done by resolution and patience, and watching your opportunity."

[The escape having been effected,] "We scrambled away as well as we could, till we got a little distance off, and out of hearing, and then we set to with a will, and rid ourselves of our fetters, all except three, and these were too tightly fitted to be got off on a sudden without better tools. We got the three chained men along with us, however, as well as we could, for we would not leave them; so we helped them on by turns; and the next day, when we were more easy, we contrived to rid them of their incumbrances. We hastened on all night. I ought to tell you that we heard the bell rung and the alarm given; but we had gained an hour good, and the ungagging of the sentinels and overseers, and hearing their story, took up some time no doubt. Besides, it is not easy to hit on a track in the dusk, and as there were fourteen of us, armed with two muskets, our pursuers would not proceed so briskly as they otherwise might, and would not scatter themselves to look after us. We were without provisions; but we did not care about that; and not being used to long walks, we were soon knocked up. But the desire of liberty kept us up, and we struck right across the country in as straight a line as we could guess. The second day we were all very sick and faint, and the night before was very cold, and we were cramped and unfit to travel. The second night we all crept into a cave, which was sandy inside, where we lay pretty warm, but we were ravenously hungry. We might have shot more than one kangaroo that day, but it was agreed that we should not fire, lest the report of our gun should betray our resting-place to our pursuers. As we lay huddled together, we heard the opossums squeeling in the trees about, and two of us, who were least tired, tried to get some of them. When we climbed up the trees they sprang away like squirrels, and we had no chance with them that way; besides, it was dark, and we could distinguish them only faintly and obscurely. We did contrive, however, to kill five by pelting them on a long overhanging bough; but they remained suspended by their tails, and did not drop, although dead. To hungry men a dead opossum is something; so one of us contrived to climb to them and get them down; and then we lighted a fire in the cave, quite at the extremity inside, to prevent the flame from being seen, and roasted them as the natives do. They were horrid rank things to eat, and almost made us sick, hungry as we were; but I don't think a hair of them was left among us. The next day we shot a kangaroo; but we feared to light a fire because of the smoke, so we ate it raw.

"We first struck on the outskirts of New Norfolk, and we debated what we should do. Some

were for attacking the settlement, and getting arms; but I persuaded them that it would be better for us to endeavor to seize some small vessel, and escape altogether from the colony; and in the mean time to keep ourselves close, and not give any alarm. My companions agreed to this, and we struck across the country to Brighton Plains, and so to Pitt Water, where we expected to find some large boats, or perhaps some small vessel, by means of which we might get away."

"And how was it that you did not follow that plan?"

"We did follow it: we got to Pitt Water, and lay snug there for a while; but we were obliged to rob a settler's house of provisions for food, and that first gave the alarm. We made a dash at a boat, but it was too late; precautions had been taken, and the soldiers were out after us. We were then obliged to retreat from Pitt Water, intending to get into the neighborhood of the lakes, and go farther westward if necessary, and retreat to the coast, where we judged we should be too far off to be molested."

"You did a great deal of mischief at Pitt Water before you left it, if all the stories are true."

"We did, Mr. Thornley, I own it: but my men were determined to have arms, and the settlers of course resisted, and some of my men got wounded, and that made them savage."

"And afterwards you attacked poor Moss' cottage?"

"My men had been told that he had a large sum in dollars at his hut—I am surprised that settlers can be so foolish as to take valuables into the bush—that was all they wanted."

"But why did you take poor Moss along with you?"

"I was obliged to do it to save his life. Some of my men would have knocked him on the head if I had not prevented them. It's true, Mr. Thornley, it is indeed—I saved his life."

"Well, that's something in your favor. And now, as the sun is sinking fast, and as the dusk will come on us presently, tell me at once what you would have me do for you."

"Mr. Thornley," said the bushranger, "I have told you of my little girl. I have seen her since the dispersion of my party at the Great Lake. You know that I and another escaped. Since then I have ventured in disguise into Hobart Town itself, and have there seen my child. The sight of her, and her embraces, have produced in me a strange feeling. I would willingly sacrifice my life to do her good; and I cannot conceal from myself that the chances are that I must be taken at last; and that if I do not perish miserably in the bush, I shall be betrayed, and shot or hanged."

"And what can I do to prevent it?"

"You can do nothing to prevent that end, for I know that I am too deep in for it to be pardoned. If I were to give myself up, the government would be obliged to hang me for example's sake. No, no; I know my own condition, and I foresee my own fate. It is not of myself that I am thinking, but of my child. Mr. Thornley, will you do this for me—will you do an act of kindness and charity to a wretched man, who has only one thing to care for in this world? I know it is much to ask, and that I ought not to be disappointed if you refuse it. Will you keep an eye on my poor child, and, so far as you can, protect her? I cannot ask you to provide for her; but be her protector, and let her little innocent heart

know that there is some one in the wide world to whom she may look up for advice—for assistance, perhaps, in difficulty; at all events, for kindness and sympathy: this is my request. Will you have so much compassion on the poor, blasted, and hunted bushranger, as to promise to do for me this act of kindness?"

I gazed with astonishment, and, I must add, not without visible concern, on the passionate appeal of this desperate man in behalf of his child. I saw he was in earnest: there is no mistaking a man under such circumstances. I rapidly contemplated all the inconveniences of such an awkward charge as a hanged bushranger's orphan. As these thoughts passed through my mind, I caught the eye of the father. There was an expression in it of such utter abandonment of everything but the fate of his little daughter, which seemed to depend on my answer, that I was fairly overcome, and could not refuse him. "I will look after her," I said; "but there must be no more blood on your hands; you must promise me that. She shall be cared for; and now that I have said it, that's enough—I never break my word."

"Enough," said he, "and more than I expected. I thank you for this, Mr. Thornley, and could thank you on my knees. But what is that? Look there! A man on horseback, and more on foot. I must be on my guard."

As he spoke, the horseman galloped swiftly towards us. The men on foot came on in a body, and I perceived they were a party of soldiers. The Gipsy regarded them earnestly for a moment, and then ran to his gun, but in his eagerness he tripped and fell. The horseman, who was one of the constables from Hobart Town, was too quick for him. Before he could recover himself and seize his gun, the horseman was upon him. "Surrender, you desperate villain, or I'll shoot you."

The Gipsy clutched the horse's bridle, which reared and plunged, throwing the constable from his seat. He was a powerful and active man, and catching hold of the Gipsy in his descent, he grappled with him, and tried to pinion his arms. He failed in this, and a fearful struggle took place between them. "Come on," cried the constable to the soldiers; "let us take him alive."

The soldiers came on at a run. In the meantime, the constable had got the Gipsy down, and the soldiers were close at hand, when suddenly, and with a convulsive effort, the Gipsy got his arms round the body of his captor, and with desperate efforts rolled himself round and round, with the constable interlaced in his arms, to the edge of the precipice. "For God's sake!" cried the constable with a shriek of agony, "help, help! We shall be over!" But it was too late. The soldiers were in the act of grasping the wretched man's clothes, when the bushranger, with a last convulsive struggle, whirled the body of his antagonist over the dreadful precipice, himself accompanying him in his fall. We gazed over the edge, and beheld the bodies of the two clasped fast together, turning over and over in the air, till they came with a terrible shock to the ground, smashed and lifeless. As the precipice overhung the river, the bodies had not far to roll before they splashed into the water, and we saw them no more.

The reader may be interested to know that Mr. Thornley was better than his word. He sought the daughter of the unfortunate man, took her home to his house, and afterwards sent her to England.

From *Tait's Magazine*.

FRANCE UNDER NAPOLEON.*

THE former work of M. Thiers, and that which he has now begun, will together comprehend the History of France during a generation, in which, more prominently than in any other era, France stood forth as the ruling spirit of Europe, and in which also, more clearly than in any other period since the fall of the Roman Empire, events have occurred that must permanently affect the state of European society. We are now long past the time, when the French Revolution could be talked of as a catastrophe influencing France alone, or influencing France but during the time of its endurance. It was a turning point in the destiny of the world. Either for good or for evil—for evil, as some faint-hearted and weak-eyed gazers on the page of history would still contend—for good to the human race, as we more courageously and more wisely trust and believe—it has taken its place among those mighty social changes, which at once arise from causes operating on the whole circle of European civilization, and produce effects modifying the whole character of that civilization from generation to generation.

And the one of the sections into which the contest between things old and new divided itself, is not less instructive or less interesting than the other. We have learned but half of the portentous lesson which is laid open to us, when we have made ourselves acquainted with that chaotic struggle of principles and passions, which furnished the matter for M. Thiers' "History of the French Revolution." That history closes with the last days of the Directory. It closes at a time when neither for France nor for the rest of Europe had the revolution worked nearly all the evil which it was doomed to work; at a time when, directly at least, the revolution had not yet begun to work, either for Europe at large or for France, that vast amount of good, which, as alike a great example of worthy ends to be aimed at and as a formidable warning against errors in the pursuit of the ends, it has already shown itself to have been destined to accomplish. A revolution prompted by principles thoroughly enlightened, fostered by motives thoroughly pure, and commenced by means thoroughly pacific and constitutional, had unfortunately been attempted by a nation which, if we regard it in the mass, must be pronounced to have been utterly unworthy of the blessings to which the contemplated changes were in themselves likely to lead. Undeserving of freedom, the French nation knew not how to use the gift when it was put into their hands. The first steps of their emancipation plunged them into anarchy, irreligion, and massacre. They dishonored that sacred name of Liberty which they had proudly written upon their banner: and they were punished—more for the sins of their governors than for their own—by having to pass again under the yoke, and to learn some of the duties of freemen from a despot whom they themselves had been obliged to place on the throne of the Capets. That which the French nation did and suffered during the anarchy of the revolution, is, if regarded

* History of the Consulate and the Empire of France under Napoleon: forming a sequel to "The History of the French Revolution." By M. A. Thiers, late Prime Minister of France, &c. Translated by D. Forbes Campbell, Esq., with the sanction and approval of the Author. London: Colburn. Vols. I. and II.

alone, a perplexing riddle. The first and principal part of the solution is to be sought in that which they did and suffered under the stern sway of Napoleon: and it yet remains to be seen, whether, even after the bitter training they received from the restored Bourbons, they are even now fully instructed in those lessons of political wisdom, which the observation of their vicissitudes has taught to the other nations of Europe.

We are still too near to the date of the French Revolution, to be ripe for a complete estimate of its historical character and relations. And not only national prepossessions, but prejudices arising accidentally out of the position in which France at present stands, cannot but tend in a considerable degree to neutralize the advantages which a native Frenchman possesses, for writing the history of the most momentous epoch in the annals of his country. Some of those disqualifications must attach themselves with particular force to any historian who has been active as a French statesman; and that M. Thiers must labor under such disqualifications in a higher degree than most politicians of his country, will probably be suspected strongly on this side of the British Channel. How far these suspicions are well founded, the progress of his history will show. Meanwhile the merit of the writer's earlier work is a sufficient guarantee for its excellence in the points by which that work was most favorably distinguished. We are sure to find a narrative which is always clear and often eloquent—a treatment of statistical details marked by that skill of popular exposition which has made the writer so famous as a debater—a system of political principles qualifying him for discerning clearly the elements of good, which lay hid in the revolutionary chaos, and leading him into error only through an occasional betrayal of leanings somewhat too democratic for most of his British readers—and an appreciation of the personal characters of the leading actors in his history, which will be always in the main temperate and kindly, although it may not unfrequently pass into that moral indifferentism, which his earlier work shares with that of his friend and fellow-laborer Mignet. In some respects, as he himself tells us, we may look for better things than those which the "History of the Revolution" gave us.

"Fifteen years have elapsed since I recorded the events of our first Revolution. Those fifteen years have been passed amid the storms of public life: I have seen an ancient throne crumbled to pieces and a new throne rise up; I have seen the French Revolution pursue its invincible course: and though the scenes which I have witnessed have not excited in me any great surprise, I have not the presumption to believe that the experience of men and of business has taught me nothing; I have the confidence, on the contrary, of having learned much, and of thus being more apt perhaps to appreciate and describe the great things done by our fathers during those heroic times. But I am certain that experience has not frozen within me the generous sentiments of my youth; I am certain that I love, as I ever did love, the liberty and the glory of France."

The History of the Consulate and Empire opens by presenting to us a picture of the weakness and danger of France, as she lay when her sceptre was wrested from the incompetent hands of the Directory. No nation was ever more in want of internal security and repose—more eager to obtain

those blessings—more ready to accept them thankfully from any hand strong enough to bestow them—more willing to reward the bestower, by paying any price he might exact, even though that price should involve the abandonment of the leading principles, for the sake of which the wiser and more patriotic citizens of France had entered upon the experiment which in the mean time had issued so disastrously. The historian has painted vigorously that state of distrust, or rather despair, which, filling the minds of almost all men in the nation, made it an easy thing for a man of commanding intellect and powerful resolution, to become virtually the sovereign of the French people.

"Is it surprising that France, to which the Bourbons could not be presented in 1799, and which, after the ill success of the Directorial Constitution, began to have no faith in the republic—is it surprising, I say, that France should throw herself into the arms of that young general who had conquered Italy and Egypt, a stranger to all the parties, affecting to disdain them all, endowed with an energetic will, showing equal aptness for military and civil affairs, and affording glimpses of an ambition which, instead of alarming the nation, was then hailed by it as a hope? Less glory than he had acquired would have sufficed to enable a man to seize the reins of government; for, some time previously, General Joubert had been sent to Novi, that he might there earn those titles which he still wanted, for effecting the revolution, since styled in our annals that of the 18th of Brumaire. The unfortunate Joubert was defeated and fell at Novi; but young Bonaparte, always fortunate and victorious, at least at that time, escaping the dangers of the sea as well as the dangers of battles, had returned from Egypt to France in an almost miraculous manner; and, on his first appearance, the Directory succumbed. All parties hastened to meet him, demanding of him order, victory, and peace.

"It was not, however, in a day, that the authority of one could supersede that mob-government where so many, alternately oppressed or oppressors, had enjoyed for a moment a share of the supreme power. It was necessary to save appearances, and, in order to induce harassed France to submit to absolute power, to lead her to it through a glorious, restorative, and semi-republican government. It was requisite, in short, that the Consulate should pave the way to the Empire."

The internal disorganization of France was rendered tenfold more alarming by the dangers which menaced her from her enemies. She not only wanted the restoration of order, and the establishment of judicious government at home; she wanted also the reconstruction of that military power which she had been able to build up for a moment in the feverish exultation of her new republican freedom, and the decay of which, through the mismanagement and misfortunes of her latest rulers, was alike dangerous to the national independence and mortifying to the deeply-seated national vanity.

"At home, La Vendée again in insurrection, abroad, the principal powers of Europe in arms, rendered the danger of the war doubly pressing. It was necessary, by the adoption of some financial measure, to supply the first wants of the famished armies; it was necessary to reorganize them, to move them forward, to give them able commanders, to add new victories to those which had been

gained at the conclusion of the last campaign; it was necessary, above all, to cure foreign cabinets of the notion of an approaching social dissolution in France, which rendered some so confident in the result of the war, others so shy in their relations with us; and all this could only be accomplished by a strong government, able to curb parties, and to enforce unity of action, without which there cannot be, in the exertions that it makes to save itself, either harmony, or energy, or success.

"The disease had arrived at that height which is frequently followed by a favorable turn, on one condition indeed, that the patient has sufficient strength left to get over the crisis. Fortunately, the strength of France was still great. The Revolution, though derided by those whom it had jostled, or whose illusions it had not realized, was, after all, the cause of justice and of reason; and it still excited the attachment which a great cause always excites. It had, moreover, numerous partisans, bound to its fortunes, in all those who had acquired new situations, bought the possessions of emigrants, or acted a part by which they had compromised themselves. In short, the nation was not so exhausted, morally and physically, as to submit quietly to the invasion of its territory by the Austrians and Russians. On the contrary, it felt indignant at this idea: its armies swarmed with admirable soldiers, officers, generals, who needed only a good direction. All these forces were ready to unite spontaneously in a single hand, if that hand was capable of directing them. Circumstances, therefore, favored the man of genius who was about to present himself; for genius itself has need of circumstances.

"Had young Bonaparte, for example, come forward in 1789, even with his talents and his glory, to preserve French society, at that time tending on all sides to dissolution, because its elements had become incompatible, in vain would he have propped it with his mighty arm: his human strength would have availed nothing against the powers of nature. At this period, on the contrary, when that old society, broken up, as it was requisite that it should be, before it was recast in a new mould, presented only scattered elements, but tending of themselves to approximate, it was prepared to accommodate itself to all the efforts of the able hand that knew how to grapple it. General Bonaparte, therefore, had for him both his own genius and the favor of circumstances. He had a whole society to organize, but a society willing to be organized and by him, because it had immense confidence in him, inspired by his unparalleled successes."

In the emergency which then impended over France, the military renown of General Bonaparte was doubtless a qualification without which his rise to the supreme power would have been impossible. The nation wanted a leader for her armies; and such a leader, if successful in his earliest undertakings, could have defeated at home all attempts at rivalry that might have been made by persons less brilliantly endowed. But the conqueror of Italy possessed other advantages, which immensely facilitated the task already marked out for him by his daring ambition. The chief of these advantages are well described by M. Thiers. On the one hand there was that wonderful quickness and dexterity, through which the young Corsican contrived to impress every one with respect for his natural talents, for his acquired knowledge,

for his aptitude for administrative and political business. It became the fashion to wonder at the versatility exhibited by the idol of the day. On the other hand, it was one of his greatest advantages—and an advantage which no one could have used with more consummate skill—that he was entirely unconcerned in the earliest and most bloody period of the republican history. He was thus not only comparatively pure in character, but, as uncommitted to any of the prevailing factions, might be supposed open to receive impressions from all, and liable to become the patron of any which might be able to secure his favor. The enthusiastic republicans, while wisely dreading his suspected ambition, gladly consented to use him as the instrument for keeping the Bourbons at a distance. The more moderate and constitutionally-inclined citizens, hoped to find in him the head of a republic, in which the government should be strong, yet the people free. The royalists, or many of them, (and Louis XVIII. among the rest,) were foolish enough to hope that he would be so obliging as to hold the sovereign power in trust, until circumstances should enable him to lay it humbly at the feet of his legitimate king, and to accept as his recompense the honors and wealth which the royal hand might deign to bestow upon him.

By common consent of all whose voices could in any way influence the decision, General Bonaparte, on the fall of the Directory, was appointed one of the Three Provisional Consuls, who were to hold office for three years only, but were charged with the task of remodelling the whole constitution. Associated with Roger Ducos, who was quite unimportant, and with the speculative and indolent Sieyès, he stepped into the first place as easily as if it had been a matter of right. At the very first meeting of the consuls for business, he took the chair with all coolness on a casual invitation from Ducos. "We have," said Sieyès to Talleyrand the same evening—"we have a master who knows how to do everything, who can do everything, and who will do everything." M. Thiers, in citing this well-known remark, gives the Abbé credit for "a resignation which does honor to his reason and his patriotism." Perhaps some better founded feeling than resignation is to be traced in some of the arrangements incorporated—with an unquestionable reference to the dangers to be apprehended from the military consul's ambition—into that elaborate constitution, the framing of which constituted the share of Sieyès in the duties of the consulate.

At the head of the republican government of France, there was to be placed, according to this constitution, an officer to be called the Grand Elector. Everything was to be done to make this eminent person august: every precaution was invented for rendering him absolutely powerless. There was but one man in France to whom the office could have been offered; and if that man accepted the office, his ambition was paralyzed forever. He himself indeed would not admit that even the chains which his colleague had tried to forge for him, would have been strong enough to bind his active hands. But he saw the snare which was laid for him, and used all means for avoiding it. Sieyès threatened to retire to the country, and leave him to deal as he best might with the awakened suspicions of the people. Bonaparte answered sternly, "Let him go. I will get a constitution drawn up by my friend Rœderer, propose

it to the two legislative sections, and satisfy public opinion, which requires the affair to be settled." But this threat of violence was not needed. Left to discharge as he pleased the real duties of government, Bonaparte had used most industriously and most successfully, as well as wisely and sagaciously, for the country and for himself, the opportunities of increasing his popularity which this short reign allowed him. He had made himself perfectly sure of his ground, before he announced his fixed resolution to refuse acquiescence in this cardinal point of the proposed constitution. He heaped on the proposed office his bitterest sarcasms.

"Your grand elector," said he to M. Sieyès, "is a do-nothing king; and the time of do-nothing kings is gone by. What man of head and heart would submit to such a sluggish life, at the price of six millions and an abode in the Tuilleries! What! nominate persons who act, and not act one's self! it is inadmissible. And, then, you think by this device to prevent your grand elector from intermeddling in the government. Were I this grand elector, I would nevertheless engage to do all that you wished me not to do. I would say to the two consuls of peace and war, "If you do not choose such a person, or if you do not take such a measure, I will turn you out." And I would soon oblige them to act as I pleased. I would make myself master again in a roundabout way."

M. Thiers compares the grand elector to the king of England; and there is some reason for the parallel. It is at least abundantly plain, that the moment this point was given up and the office of first consul determined upon, with its sweeping powers and its ten years' duration, the constitution of France had ceased to be republican. It had become an elective monarchy, and a monarchy in which the power of the first magistrate—having no aristocracy to curb it—was wider and more securely founded than that of any other monarch in Europe. Nothing remained for the person who might obtain the office, but to take care that he should use firmly the opportunity it gave him of preserving possession against all intruders. The representation of the people was a mere farce. The coöperation of the second and third consuls was, as M. Thiers calls it, a mask to hide the immense authority which the first consul was to wield. Sieyès accepted an estate from the legislative commission, and retired from public life. General Bonaparte, entering upon his office of first consul in the end of December, 1799, was thenceforth as truly master of France as if he had at once placed on his head the imperial crown. In February following, with great state and ceremony, he took up his residence in the Tuilleries. The next day, in going through the palace with his secretary, "Well, Bourrienne," said he, "here we are, in the Tuilleries; and here now we must stay!"

The first consul had formidable duties before him—duties from whose performance any weaker mind must have recoiled—duties whose successful execution was an aim worthy of his iron will, of his singular union of talents, of his remarkable aptitude in finding out fit instruments for the prosecution of his designs. He had to complete that task of tranquillizing and reorganizing the interior of the country, upon which he had entered with such vigor during the provisional government. The means which he used for the purpose, espe-

cially those which bore upon the reestablishment of financial order and public credit, are described by the historian with much fulness and excellent clearness. It behoved him to accomplish this great undertaking even if France was to remain in peace. Still more imperatively was the undertaking necessary, if the wars of the French republic with foreign powers were to be continued. And that those wars would be continued, no one could for a moment doubt. The first consul himself had not the slightest wish that hostilities should cease. This is just as certain in regard to his views at this time, as it is that, in a later stage of the contest he was really anxious for peace. At his first assumption of the government he saw plainly, that a renewed career of conquest and of glory was necessary, for enabling him to vanquish the obstacles with which he had already to contend at home, and which would have become too strong even for him, if the French nation had been allowed leisure to make themselves exactly acquainted with the position in which the new constitution placed them towards their master. Monsieur Thiers unquestionably, here as in many other places, does Napoleon much more than justice, when he represents him as being, at this time, not indeed hopeful that peace could be attained, but sincerely anxious for its attainment. The contrary is distinctly proved by Montholon's Memoirs as well as by other authorities. But, on the other hand, there is nothing that is one whit too severe in the censures which the historian deals out upon the policy of the allied powers, and especially upon that of the English cabinet. The remonstrances and warnings of the Whig leaders in parliament were treated with indifference and contempt. Pitt himself, who at the commencement of the ruinous contest had been wise enough to desire averting it, was now carried away by the torrent of influence, royal and aristocratical and political, to which the course of occurrences had afforded a vent; and he had it for a time in his power even to allege the popularity of the "just and necessary war," as a reason for treating with scorn all overtures for an accommodation.

The war was renewed by the Austrian armies on the continent, supported by the British fleet. Its opening events furnish to the historian the materials for two animated and momentous chapters, the importance of which is adequately indicated by their titles. The one is headed "Ulm and Genoa," the other "Marengo." The heroes of the former chapter are Moreau and Masséna; Napoleon himself, again at the head of his invincibles, is the ruling spirit of the latter.

The least interesting portion of this warlike history, is that which relates to the campaign in southern Germany, in which the armies of Moreau and Kray manœuvred on the Rhine and Danube, and which ended by Moreau's successful attempt to shut up the Austrian army in Ulm. The most curious point here is the conduct of Bonaparte towards Moreau, and the light which it throws on the jealousy supposed to have been felt by him towards that brave and skilful, but temporizing general. It is maintained strongly by M. Thiers, that no such jealousy existed. In proof of this doubtful assertion, a full account is given of the plan which the first consul had formed for the campaign. This plan was characterized by his own peculiar boldness, and offered to the general (if successful) an opportunity of rivalling the fame of Bonaparte himself; but, on the other

hand, it was exposed to risk of failure in several particulars, and required a constant promptitude and fertility of expedients which Moreau did not possess. He was alarmed by the risks it involved, and insisted on being allowed to adopt a scheme of tactics more accordant with his own cautious character. The result of the discussion is related by M. Thiers, from information furnished to him by the officer who became the medium of communication.

"It is a sight worthy of the attention of history, that of these two men, opposed to each other in an interesting circumstance, which exhibited so conspicuously their diversities in mind and character. The plan of Moreau, as is frequently the case with the plans of second-rate men, had only the appearances of prudence; but it might succeed in the execution, for, we must incessantly repeat it, the execution redeems everything: sometimes it causes the best combinations to miscarry, and the worst to succeed. Moreau persisted, therefore, in his ideas. The first consul, wishing to persuade him by means of a chosen agent, summoned to Paris General Dessoles, chief of the staff of the army of Germany, possessing an acute, penetrating mind, worthy of serving for a link between two powerful and susceptible men; for he had a desire to conciliate his superiors, which is not always found in subordinates. The first consul, therefore, called him to Paris about the middle of March, (end of Ventôse,) and kept him there several days. After explaining his ideas to him, he made him perfectly comprehend them, and even prefer them to those of Moreau. General Dessoles, nevertheless, persisted in advising the first consul to adopt Moreau's plan, because it was necessary, in his opinion, to leave the general who operates, to act according to his own ideas and character, when he is moreover a man worthy of the command intrusted to him. 'Your plan,' said he to the first consul, 'is grander, more decisive, probably also more sure; but it is not adapted to the genius of him who is to execute it. You have a way of carrying on war which is superior to any other; Moreau has his, inferior, no doubt, to yours, but yet excellent. Leave him to act: he will act well, slowly perhaps, but surely; and he will procure for you all the results that you need for the success of your general combinations. If, on the other hand, you insist on the execution of your ideas, you will upset him, you will even offend him, and you will obtain nothing from him, by wanting to obtain too much.' The first consul, as well versed in the knowledge of men as in that of his profession, appreciated the wisdom of the advice of General Dessoles, and gave way. 'You are right,' said he; 'Moreau is not capable of appreciating and executing the plan which I have conceived. Let him do as he pleases, provided he throws Marshal Kray upon Ulm and Ratisbon, and afterwards sends back his left wing, in time, upon Switzerland. The plan, which he does not comprehend, which he dares not venture to execute, I will execute myself, on another part of the theatre of war. What he dares not do on the Rhine, I will do on the Alps. He may, by and by, regret the glory which he relinquishes to me.' Proud and profound words, containing an entire military prophecy, as the reader will be able to judge presently."

The narrative of Masséna's heroic defence of Genoa (if successful) an opportunity of rivalling the fame of Bonaparte himself; but, on the other

incidents in the history of the French wars in Italy. The bravery and self-devotion of the general and his sacrificed army, are indeed the only circumstances capable (and even these capable but imperfectly) of tempting us to forget that course of cruel and unprincipled rapacity, which was openly practised by Masséna in his own dealings with the Italians, and countenanced by him when his example was followed by his troops. This is one of the points over which M. Thiers passes with a light and timid step: indeed, the tenderness with which he touches on it is more indicative of national prepossessions, than creditable to his historical impartiality.

In May, 1800, Bonaparte effected his celebrated passage of the St. Bernard. The facts of this remarkable triumph of human art and courage over the resistance of nature, have long been before the world. There was little or nothing new for the historian of the consulate to communicate; but that which there was to tell he has told with equal perspicuity and spirit. The crossing of the mountain with the artillery, and the forcing of the pass of Bard, are related picturesquely and with interest. A little personal anecdote, introduced in the midst of the historical exposition, exhibits one of those traits of kindness which we are willing to believe natural, and which agreeably relieve the mind in its contemplation of the many painful features inevitably presented by the biography of a mighty conqueror.

"Artists have delineated Napoleon crossing the Alpine heights mounted on a fiery steed. The plain truth is, that he ascended the St. Bernard in that gray surtout which he usually wore, upon a mule, led by a guide belonging to the country; evincing, even in the difficult passes, the abstraction of a mind occupied elsewhere, conversing with the officers scattered on the road, and then, at intervals, questioning the guide who attended him, making him relate the particulars of his life, his pleasures, his pains, like an idle traveller, who has nothing better to do. This guide, who was quite young, gave him a simple recital of the details of his obscure existence, and especially the vexation he felt, because, for want of a little money, he could not marry one of the girls of his valley. The first consul, sometimes listening, sometimes questioning the passengers with whom the mountain was covered, arrived at the Hospice, where the worthy monks gave him a warm reception. No sooner had he alighted from his mule than he wrote a note which he handed to his guide, dearing him to be sure and deliver it to the quarter-master of the army, who had been left on the other side of the St. Bernard. In the evening, the young man, on returning to St. Pierre, learned with surprise what powerful traveller it was whom he had guided in the morning, and that General Bonaparte had ordered that a house and a piece of ground should be given to him immediately, and that he should be supplied, in short, with the means requisite for marrying and for realizing all the dreams of his modest ambition. This mountaineer died not long since, in his own country, the owner of land given to him by the ruler of the world. This singular act of beneficence, at a moment when his mind was engaged by such mighty interests, is worthy of attention. If there were nothing in it but a mere conqueror's caprice, dispensing at random good or evil, alternately overthrowing empires or rearing a cottage, it may

be useful to record such caprices, if only to tempt the masters of the earth to imitation; but such an act reveals something more. The human soul, in those moments when it is filled with ardent desires, is disposed to kindness: it does good by way of meriting that which it is soliciting of Providence."

In a month after the passage of the Alps, the great battle of Marengo laid Italy, for the second time, at the feet of him who, by birth and language one of her sons, was destined to make himself her master by the aid of foreign armies. The battle is described with great clearness and impartiality. Indeed, the historian is much less apt to veil the faults or mistakes of his hero when he treats of his military operations, than when he comes upon awkward points in his administration or his diplomacy. No attempt is made to disguise the oversights which had been committed, and which, in the early part of that bloody day, made the Austrians really victorious. Full justice is done to the exertions both of Kellermann and Desaix: and the estimate of comparative merit is made, rationally and fairly, in the following terms:—

"Some detractors of General Bonaparte have pretended to attribute to General Killermann the victory of Marengo, and all the results which that memorable battle brought in its train. Why, then, if General Bonaparte must be stripped of this glory, not ascribe it to that noble victim of the happiest inspiration, to that Desaix, who, anticipating the orders of his chief, sacrificed his life, but won the day! Or why not ascribe it to that intrepid defender of Genoa, who, by detaining the Austrians on the Apennines, gave General Bonaparte time to descend from the Alps, and delivered them up to him almost half destroyed! According to some people Generals Killermann, Desaix, and Masséna, would be the real conquerors of Marengo—all, excepting General Bonaparte. But, in this world, the voice of nations has always decreed glory; and the voice of nations has proclaimed conqueror him who discovered, with the glance of genius, the use that might be made of the high Alps, for debouching on the rear of the Austrians; who deceived their vigilance for three successive months; who created an army which did not exist; who caused its formation to be disbelieved by all Europe; who crossed the St. Bernard without beaten road, appeared unexpectedly in the midst of Italy, confounded with astonishment, surrounded his unfortunate adversary with marvellous art, and fought with him a decisive battle, lost in the morning, regained in the evening, and sure to have been regained, if not on that day, yet on the next; for, besides Desaix's 6000 men, 10,000 hastening up from the Tessino, and 10,000 posted on the Lower Po, would have furnished infallible means for destroying the hostile army. Let us suppose, in fact, the Austrians, victorious on the 14th of June, entering the defile of La Stradella, finding at Placenza Generals Duhesme and Loison, with 10,000 men, ready to dispute with them the passage of the Po, and at their heels General Bonaparte, reinforced by Generals Desaix and Monecy; what would the Austrians have done in that dangerous place, stopped by a well-defended river, and pursued by an army superior in number! They would have succumbed more disastrously than in the plains of the Bormida. The real conqueror of Marengo was, therefore, he who chained

Fortune by his combinations, profound, admirable, unequalled in the history of great captains.

"For the rest, he was ably served by his lieutenants, and there is no need to sacrifice any glory for the purpose of building up his. Masséna, by an heroic defence of Genoa—Desaix, by the most happy determination—Lannes, by incomparable firmness in the plain of Marengo—Kellermann, by a splendid charge of cavalry—all aided him in his triumph. He rewarded them all in the most signal manner; and, as for Desaix, he evinced for his death the noblest sorrow. The first consul decreed magnificent honors to the man who had rendered France so important a service; he even adopted his military family, and placed about his own person his two aides-de-camp, who were thrown out of employment by the death of their general; these were Colonels Rapp and Savary."

The first volume of the History closes with the return of the first consul in triumph to Paris, and with the commencement of the negotiations for peace with Austria, in the summer of 1800.

The second volume relates the events of the first year, during which General Bonaparte wielded the power which he had thus firmly clutched in his grasp. Those events crowd upon each other with a rapidity which makes it difficult, even for the historian himself, clearly to arrange or distinctly to portray them; and which puts it altogether out of the question to attempt, in a cursory survey of his work, more than a glance at one or two of the points most generally interesting.

We must pass over without remark that opening chapter of the volume, in which are described the tragical vicissitudes undergone by the French army in Egypt, after their invincible general, Bonaparte, had deserted them, flying to Europe (as he himself and M. Thiers are agreed in asserting) with the noble design of saving France, but influenced, perhaps, as it may now be allowable to believe, by motives which were not wholly of so lofty or so pure a nature. Nor can we bestow even a passing notice on the narrative, which we have read with much satisfaction as well as amusement, of the first consul's diplomatic dealings with those foreign powers, which at length he appears to have been really desirous to conciliate, and which now felt it necessary to recognize in the French Republic something more respectable than that horde of murderers and robbers, with which it had at one time been declared infamous as well as unsafe for the legitimate sovereigns of Europe to hold any intercourse. The king of Prussia was already on friendly terms with France. The king and queen of Spain were made friendly through artful addresses to their personal foibles, and still more through the influence of their infamous favorite, Godoy the Prince of Peace, whose character, as well as those of his nominal master and real mistress, is painted in lively colors. Paul I., the insane emperor of Russia, already jealous of his allies, was rendered, by politic attentions, as fiercely eager in his admiration of Napoleon, as he had formerly been in his hate and terror of French democracy. Neither into the particulars of these intrigues, nor into the curious history of those negotiations with Austria, which, at first mortifyingly abortive, issued at length in the Peace of Luneville, is it possible for us to enter.

But we are tempted to dwell on the tragic scene

which closed the life of the Emperor Paul. In regard to it, M. Thiers has been able to collect some information not previously published; and he presents us with a narrative which he is perhaps right in believing to be the most complete recital that will ever be obtained of this horrible catastrophe.

The deviser of the conspiracy was (as has long been known) Count Pahlen, an officer of distinction, and then governor of St. Petersburg, who is described as being a Russian, such as Russians were in the days of Peter the Great. The safety of the empire, and the lives of individuals, seemed to him and to others to be alike capable of being preserved in no other way than by the destruction of the imperial lunatic. Communications were made to the Grand Duke Alexander, who was led to expect that nothing was contemplated beyond dethroning his father; and who, with a simplicity which was wonderful if it really existed, believed that he had sufficiently ensured the emperor's safety, by exacting a pledge that no violence should be attempted against his person. Actors were then engaged for the scene of blood: but even the most active and undaunted of these, the Hanoverian general, Benningsen, asserted that the deposition of the emperor was the only part of the design with which he was made acquainted. The event showed that some of Pahlen's agents were more competently instructed. The count himself behaved with imperturbable composure. When the suspicious emperor charged him, almost in direct terms, with being cognizant of a conspiracy against his life, he answered by coolly avowing the fact, and declaring that he had taken part in the plot for the purpose of defeating it. When, a few hours before the murder, Paul ordered a despatch to be written to his ambassador at Berlin, threatening an invasion of Prussia, Pahlen deliberately added, in his own handwriting, an announcement that the emperor was indisposed, and that the consequences might prove serious. On the 23d of March, 1800, at Pahlen's dinner-table, he and Benningsen, carefully keeping themselves sober, explained to their half-intoxicated party of selected guests, that they were expected to proceed to the palace and compel Paul to abdicate. That which followed will be best told in the words of M. Thiers.

"The night appearing sufficiently advanced, the conspirators, to the number of about sixty, sallied forth, divided into two bands. Count Pahlen took one under his direction, General Benningsen the command of the other; both officers, dressed in their full uniform, and wearing their sashes and orders, marched forward, sword in hand. The palace Michael was constructed and guarded like a fortress; but the bridges were lowered, and the gates thrown open to the chiefs of the conspirators. Benningsen's party marched first, and proceeded direct towards the emperor's apartments. Count Pahlen remained behind, with his reserved body of conspirators. This man, who had organized the conspiracy, disdained to assist personally in its execution. He was only there to provide for any unexpected emergencies. Benningsen penetrated into the apartment of the sleeping monarch. Two heyduks were on duty as his body-guard. These brave and faithful attendants attempted to defend their sovereign. One was struck down by a blow from a sabre; the other took flight, crying out for help—cries utterly unavailing in a palace, the guards of which are

almost all accomplices in the plot! A valet, who slept in a room adjoining that of the emperor, ran to the scene; they compelled him, by force, to open the door of his master's chamber. The unhappy Paul might have found a refuge in the apartments of the empress; but, in his distrustful suspicions, he had taken the precaution, every night, to barricade the door which led to them. All escape being cut off, he flung himself to the bottom of the bed, and concealed himself behind the folds of a screen. Plato Soubow ran to the imperial bed, and, finding it empty, cried out in alarm, 'The emperor has escaped; we are lost!' But, at the same instant, Benningesen caught sight of the prince, rushed towards him, sword in hand, and presented to him the act of abdication. 'You have ceased to reign!' he exclaimed to him; 'the Grand Duke Alexander is now emperor. I summon you, in his name, to resign the empire, and to sign this act of abdication. On this condition alone I answer for your life.' Plato Soubow repeated the same summons. The emperor, confused and lost in dismay, demanded of them what he had done to deserve such treatment. 'For years past you have never ceased to persecute us,' retorted the half-intoxicated assassins. They then pressed upon the unhappy Paul, who struggled hard, expostulated, and implored them in vain. At this moment a noise was heard; it was the footsteps of some of the conspirators who had remained behind; but the assassins, believing that some one was coming to the assistance of the emperor, fled in disorder. Benningesen alone, inflexibly resolute, remained in the presence of the monarch, and, advancing towards him, with his sword pointed at his breast, prevented him stirring from the spot. The conspirators, having recognized each other, reëntered the chamber, the theatre of their crime. They again hemmed in the unfortunate monarch, in order to force him to subscribe his abdication. The emperor for an instant tried to defend himself. In the scuffle, the lamp which gave light to the frightful scene, was overturned and extinguished. Benningesen ran to procure another, and, on his return, discovered Paul expiring under the blows of two assassins: one had broken in his skull with the pommel of his sword, whilst the other was strangling him with his sash.

"Whilst this scene was enacting, Count Pahlen had remained outside, with the second band of conspirators. When he was told that all was over, he ordered the body of the emperor to be laid out on the bed, and placed a guard of thirty men at the door of the apartment, with orders not to admit any one, even the members of the imperial family. He then repaired to the grand duke, to announce to him the terrible occurrence of the night.

"The grand duke, in a state of violent agitation, demanded of him when he approached, what had become of his father? The silence of Count Pahlen soon dissipated the fatal illusions he had cherished, in imagining that an act of abdication was only contemplated. The grief of the young prince was profound; it continued to be, we are told, the secret remorse of his life, as he was naturally of a good and generous nature. He threw himself upon a chair, and burst into tears; would listen no longer to anything, but loaded Pahlen with bitter reproaches, which the latter received with an imperturbable composure.

"Plato Soubow went in quest of the Grand Duke

Constantine, who was wholly ignorant of what was going on, but who has been unjustly accused of having been implicated in this bloody catastrophe. He came to the spot trembling, believing that all his family were to be sacrificed, found his brother overwhelmed with despair, and then learnt everything which had taken place. Count Pahlen had desired a lady of the palace, who was very intimate with the empress, to acquaint her with the fact of her tragical widowhood. This princess rushed in haste towards her husband's apartments, and attempted to reach his death-bed; but the guards kept her back. Having for an instant recovered from her first paroxysm of grief, she felt, together with the emotions of sorrow, the rising impulses of ambition awaken in her breast. She thought of the Great Catherine, and wished to reign. She despatched several persons to Alexander, who was about to be proclaimed, telling him that the throne belonged of right to her, and that it was she, and not he, who ought to be proclaimed as successor. This was a new embarrassment; this was increased anguish for the already lacerated heart of the son, who, about to ascend the steps of the throne, had to pass between the corpse of a murdered father, and an agonized mother in tears, frantically demanding, by turns, her husband, or the sceptre. The night was consumed while these appalling and tragical events were passing; the day approached; it was necessary to leave no time for reflection; it was of importance that the death of Paul and the accession of his successor should be proclaimed at the same time. Count Pahlen approached the young prince: 'You have wept sufficiently as a child,' said he; 'come now and reign.' He tore him from this house of mourning, and, followed by Benningesen, hastened to present him to the troops.

"The first regiment they met was that of Préobrajensky. As it was entirely devoted to Paul I. their reception was very cold. But the others, who were attached to the grand duke, and who, besides, were under the influence of Count Pahlen, who possessed considerable ascendancy over the army, did not hesitate to cry, 'Long live Alexander.' The example was followed; and soon the young emperor was proclaimed, and placed in possession of the throne. He returned, and took up his residence with his wife, the Empress Elizabeth, at the Winter Palace.

"St. Petersburg was filled with consternation at the news of this bloody catastrophe. The impression it created, proved that the manners of the empire had undergone a change, and that, since 1762, Russian manners had become modified by the influence of European civilization. It may be said to the honor of Russia, that if she had already progressed since 1762, she has equally advanced since 1800. The Russians exhibited, on that occasion, feelings which did them honor. They feared Paul I. and his insanity, more than they hated him, as he was not of a sanguinary character. The horrible circumstances of his death were immediately known, and inspired the deepest commiseration. His body lay in state, according to usage; but infinite precautions were used to disguise his wounds. Military gloves concealed the mutilation of his hands. A large hat completely covered his head. His face was disfigured by contusions; but it was given out that he had died of apoplexy."

But, before calling on us to contemplate this

barbarous act of a barbarian race, the historian has led us through a series of incidents and speculations, in which we recognize more easily the character of modern Europe, and the nature of the influences by which European history is chiefly moulded. The first consul was steadily and skilfully pursuing his course—conquering abroad in order to gain advantages in treaties—completing the remodelling and consolidation of civil institutions at home, partly (we may hope) in obedience to patriotic and philanthropic principles, but more, as it is to be suspected, with the desire of fitting France better and better to become the instrument of his aggrandizement—and studying, in all his dealings with questions that involved the interests or awakened the feelings of factions in the nation, at once to conciliate those who could be conciliated, and to disarm those that could and might have used their power to resist him. The financial reforms proceeded with intelligence and success; the emigrants were treated with lenity; the moderate revolutionists were caressed and trusted; the untameable democrats were watched and crippled; the press was subjected to restraints, which no man but he who then governed France would have dared to speak of, or been allowed to impose. And, meanwhile, there was taken that which, in the state of feeling then prevalent, might have seemed to be the boldest step of all. Measures were adopted—especially by indulgence to the priests, and by the allowance (to those who chose it) of worshipping in the churches on Sunday instead of the decadi—for that restoration of the Catholic religion, which Bonaparte had already determined on effecting, and which, in no long time, he was able to effect as easily as the first republicans had effected its overthrow. Even the feeling of aristocracy was flattered by this extraordinary man, who, quite uncommitted to the extreme principles of the revolution, and proudly conscious how difficult it would be to shake him in his seat, now seemed actually to take a pride in bidding defiance to all those influences to which he had owed his unexampled elevation. Yet, in this, as in all things else, there was cool and sagacious calculation hid beneath the appearance of reckless daring. The first step in the homage of Bonaparte to the spirit of the old regime, was taken in a way which enlisted the national and military pride of France, unconsciously, yet unavoidably, on the side of the feelings which it was wished to reëxcite. The splendid festival of the 23d September, 1800, was the occasion upon which the experiment was tried.

“The delivery to the French army of the three fortresses of Ulm, Ingolstadt, and Philipsburg, took place most seasonably for the celebration of the fête of the 1st Vendémiaire. It could not fail to revive the hopes of peace, by furnishing evidence of the extremity to which Austria was reduced. This fête, one of the two which the Constitution had retained, was destined to celebrate the anniversary of the foundation of the republic. The first consul determined that it should not be less pompous than that of the 4th of July, so opportunely heightened by the presentation to the Invalides of the colors taken in the last campaign: he resolved that it should be distinguished by a character as patriotic, but more serious, from all those which had been given during the course of the revolution, and, above all, that it should be exempt from the ridicule attached to the imitation of ancient customs in modern times.

“Religion, it must be confessed, leaves a great void in the solemnities of nations, when it is excluded from them. Public games, theatrical representations, and fires illumining the night with their brightness, may occupy, during several hours, the multitude assembled to rejoice at any joyful occurrence, but cannot fill up an entire day. In all ages nations have been disposed to celebrate their victories at the foot of their altars, and they have converted their public ceremonies into an act of thanksgiving to the Deity. But altars France then had none. Those which had been erected to the goddess of Reason during the reign of terror, those which the Theophilanthropists innocently strewed with flowers during the licentious system of the Directory, were covered with a ridicule never to be effaced; for, in regard to altars, none are respectable but those which are ancient (!) Now, the old Catholic altar of France had not yet been restored. Nothing, consequently, was left but ceremonies in some sort academic, beneath the dome of the Invalides; elegant discourses, such as M. de Fontanes could deliver; or patriotic airs, such as a Mehul or a Lesueur could compose. The first consul, sensible of all this, sought therefore to supply the place of the religious feature by a profoundly moral feature.

“The homage to Washington, the presentation of the colors taken at Marengo, had already supplied materials for the two fêtes celebrated during his consulship. He contrived to find, in a great reparative act, the subject-matter of the fête of the 1st of Vendémiaire, year IX. (23d September, 1800.)

“At the time of the violation of the tombs at St. Denis, the body of Turenne had been found in perfect preservation. Amidst the excesses of the populace, an involuntary feeling of respect had saved these remains from the general profanation. Deposited at first in the Jardin des Plantes, they had afterwards been consigned to the care of M. Alexandre Lenoir, a man whose pious zeal, worthy of being recorded in history, had preserved for us a multitude of ancient monuments, which he had collected in the museum of the Petits Augustins. There lay these remains of Turenne, exposed to the curiosity, rather than to the respect, of visitors. The first consul conceived the idea of depositing the relics of this great man beneath the dome of the Invalides, and under the guard of our country's veterans. To glorify an illustrious general and a servant of the ancient monarchy, was reconciling the glories of Louis XIV. with those of the republic; it was reëstablishing respect for the past, without offending the present; it was, in short, the whole policy of the first consul, under the noblest and the most touching form. This removal was to take place on the last complementary day of the year VIII. (22d of September,) and, on the following day, the first stone of the monument to Kléber and Desaix was to be laid. Thus, at the moment when our earth, in obedience to the laws which govern its motions, was completing one great century, and giving birth to another, (no less famous in its turn, if it prove one day worthy of its commencement,) at this moment the first consul resolved to pay a joint homage to the hero of past times and to the twin heroes of the present time. To render these two ceremonies the more striking, he imitated in some points what had been practised at the federation of 1790, and desired all the departments to send to him representatives, who, by their presence,

should give to these fêtes not merely a Parisian, but a national character. The departments cordially responded to this appeal, and chose distinguished citizens, whom curiosity, a desire to see with their own eyes disorder succeeded by tranquillity, the miseries of anarchy by prosperity, and the desire especially to approach and to converse with a great man, drew in great numbers to Paris.

"On the fifth complementary day, in the year VIII. (September 22d,) the public authorities repaired to the museum of the Petits Augustins, to fetch the car on which was laid the body of Turenne. On this car, drawn by four white horses, was placed the sword of the hero of the monarchy, preserved in the family of Bouillon, and lent to the government for that noble ceremony. Four old generals, mutilated in the service of the republic, held the slips of the car; it was preceded by a pie-balled horse, like one which Turenne frequently rode, harnessed as horses were in his time, led by a black, and offering an accurate representation of some scenes from the age to which this homage was paid. Around the car marched the invalids, followed by some of those fine troops which had just returned from the banks of the Po and of the Danube. This extraordinary and noble procession passed through Paris, amidst an immense concourse, and proceeded to the Invalides, where the first consul awaited it, surrounded by the envoys of the departments, both those of the old France of Louis XIV., and those of new France; these latter representing Belgium and Luxemburg, the Rhenish provinces, Savoy, and the county of Nice. The precious relique borne by this train was placed under the dome. Carnot, minister of war, delivered a simple and suitable address; and, while music of a solemn kind pealed through the vaulted edifice, the body of Turenne was deposited beneath the monument where it now reposes, and where it was soon to be rejoined by his companion in glory, the illustrious and virtuous Vauban; where he was destined to be joined one day by the author of the great things which we are here relating; where he will certainly remain, surrounded by this august company, throughout the ages which Heaven may reserve for France.

"If, in times like ours, when faith is quenched, anything can supply its place, and equal, perhaps, the pomp of religion, it is such spectacles.

"On the evening of that day, a gratuitous representation of the Tartuffe and the Cid was given to the people of the capital, with a view to afford them an amusement less coarse than usual. The first consul attended the performance. His presence, his intention, instinctively guessed by that impressible and intelligent populace, all concurred to maintain, in that tumultuous assemblage, perfect decorum, a very unusual thing at gratuitous representations. The silence was interrupted only by cries, a thousand times repeated, of '*Vive la République! Vive le Général Bonaparte!*'

"On the following day, the first consul, accompanied, as on the preceding, by the public authorities and the envoys of the departments, repaired to the Place des Victoires. There was to be raised a monument in the Egyptian style, destined to receive the mortal remains of Kléber and Desaix, who, according to the intention of the first consul, were to rest side by side. He laid the first stone,

and then proceeded on horseback to the Invalides. There the minister of the interior, who was his brother Lucien, delivered a speech on the state of the republic, which made a strong impression. Certain passages were highly applauded, among others, the following, relative to the present age and the age of Louis XIV.: 'One might say, that at this moment those two great ages have met to express mutual admiration over that august tomb.' The speaker, while pronouncing these words, pointed to the tomb of Turenne. He was answered by unanimous applause; proving that all hearts, without derogating from the present, were willing to take again from the past what deserved reviving. And, that the spectacle might be complete, that the ordinary illusions of human nature might have their share in these scenes, otherwise so noble, the orator further exclaimed: 'Happy the generation which sees a revolution begun under monarchy terminate in a republic!'

"During this ceremony, the first consul had received a telegraphic despatch, announcing the armistice of Hohenlinden and the cession of the three fortresses of Philippsburg, Ulm, and Ingolstadt. He sent his brother Lucien a note, which was read to those present, and greeted with greater applause than the academic harangue of the minister of the interior. Notwithstanding the respect due to the place, shouts of, '*Vive Bonaparte! Vive la République!*' shook the vaults of the noble edifice. An immediate publication of the news in Paris produced a more profound satisfaction than all the rejoicings destined for the amusement of the multitude. People were not afraid of war; they were full of confidence in the genius of the first consul, and in the courage of the French armies, if it must be continued: but, after so many battles, after so many troubles, they wished to enjoy in peace the glory acquired, and the prosperity that was beginning to dawn."

The effect which the first consul's course of policy produced, in reconciling the nation at large to his government, was all that he could have desired. Hardly, perhaps, was there any party, much interested in political questions, that did not find in his measures something to disapprove. But nowhere was there any large party which had not become convinced, that his rule was the safest under which France could then be placed.

"In all parties there are two sets of persons; the one numerous, and honest, whom a man may bring over to himself by realizing the wishes of the country; the other, small in number, stubborn and factious, which, far from contenting, you deeply mortify by realizing those wishes, because you deprive it of its grievances. With the exception of this latter class, all the parties were satisfied; and lent freely their support to the first consul; or resigned themselves, at least, to his government, if their cause was irreconcilable with his; as the royalists, for example. The patriots of '89—and, ten years before, these comprised nearly all France—the patriots of '89, at first hurried on by enthusiasm towards the Revolution, soon borne back at the sight of the bloody scaffold, now disposed to think that they had been mistaken on almost everything, conceived that they had at length found, under the consular government, all that was possible to be realized in their wishes. The abolition of the feudal system, civil equality, a certain intervention of the country in its affairs, no great deal of liberty, but much order, the triumphant position of France in Europe—all this, very different it is

true, from what they had at first wished for, but now sufficient in their estimation, all this seemed ensured to them. M. De la Fayette, who in many respects, resembled those men, excepting that he was less convinced—M. de la Fayette, released from the dungeons of Olmütz, through an act of the first consul's, proved, by his perfectly disinterested assiduities towards him, the esteem which he felt for his government, and the adhesion of those who entertained sentiments like his own. As for the more ardent revolutionists, who, without being attached to the Revolution from participation in its condemnable excesses, adhered to it from conviction and from sentiment—these were pleased with the first consul for being the reverse of the Bourbons and ensuring their definitive exclusion. The purchasers of national domains, though looking black at times, on account of his indulgence towards the emigrants, had no doubt of his resolution to uphold the inviolability of the new properties, and clung to him as to an invincible sword, that secured them from the only real danger with which they were threatened, the triumph of the Bourbons and the emigrants by means of the arms of Europe.

“As for that timid and well-disposed portion of the royalist party, which sought, above all, to be relieved from all further dread of the scaffold, exile, or confiscation, which, for the first time for ten years past, began not to have them before its eyes, it was almost happy; for, with it, to have nothing to fear, was almost happiness. All that the first consul did not yet grant, it finally anticipated from him, if I may so express myself. To see the people in their workshops, the tradesmen at their counters, the nobility in the government, the priests at the altar, the Bourbons in the Tuilleries, and General Bonaparte at their side, in the highest station imaginable for a subject, would have been to these royalists perfection. Of these things there were three or four, which already they clearly discerned in the acts and plans of the first consul. As for the last, that of seeing the Bourbons again in the Tuilleries, they were disposed, in their good-natured credulity, to expect it of him, as one of the miracles of his astounding genius; and, if the difficulty of believing that a man would thus give up to others a crown which he held in his hand, staggered those possessed of some perspicacity, their resolution was soon taken. ‘Let him make himself king,’ said they, ‘but let him save us, for monarchy alone can save us!’ A great man, in default of a legitimate prince, seemed acceptable to them; but a king they must have at any rate.

“Thus, by ensuring to the patriots of '89 civil equality; to the purchasers of the national domains, to the staunchest patriots, the exclusion of the Bourbons; to the moderate royalists personal safety, the reestablishment of religion; to all, order, justice, national greatness, he had won the honest and disinterested mass of all the parties.

“There was still, what there always is, the implacable portion of these parties, that which time never changes but by consigning it to the grave. Those who compose it are, in general, the most conscientious, or the most guilty of men; and these are always last upon the breach.”

We are now to see how far Bonaparte found himself able to presume on his position in regard to both of those sections, into which the community is thus described to us as having been divided:—the vast majority, satisfied in the main with

the consular government, and not likely to be aroused into dissatisfaction, unless by some overwhelming misfortune, or some fatal error, on the part of him by whom the power of that government was wielded;—the small but dangerous minority, composed of those implacable adherents either of legitimate monarchy or of anarchical republicanism, who could not be appeased, and who would hesitate at no means promising satisfaction to their hatred. If there were, in the heart of the French nation, any calmly patriotic thinkers, who already saw and feared the elements of despotic sway, which were even then working actively, and were about to manifest themselves unequivocally to the whole world—such thinkers, unprepared to act unless by open and honest means, and unpossessed of any means of the sort, remained silent as well as inactive. The events of that critical period present no proof that such men existed: the history now open before us does not recognize the fact that they did exist.

The contrary influences which acted upon Napoleon in the choice of the principles by which he was to be guided in the further development of his scheme of government, were represented by two of his most active ministers. These were, also, each in his own sphere, two of the most remarkable men of our times. Fouché, the minister of police, represented the republican principle; and he, on all occasions when advice could safely be offered to his master, advocated a cautious maintenance of democratic forms and doctrines. For the monarchical principle similar services were performed, with much greater dexterity, and with incomparably greater success, by the most artful diplomatist of modern Europe, M. de Talleyrand, who was the minister for foreign affairs. Of each of these adroit intriguers, M. Thiers has sketched a lively portrait. He thus describes Fouché.

“The police was not at that period what fortunately it has since become, a mere surveillance, without power, charged solely with warning and giving information to justice. It was an immense arbitrary authority deposited in the hands of a single man. The minister of the police could exile these as revolutionists, could recall those as emigrants, fix for all the place of their residence, continue or remove the sequestration from the property of returned emigrants, restore or take away his church from a priest, suppress or reprimand a journal which had displeased him; lastly, point out any person to the mistrust or the favor of a government, which then had an extraordinary number of places to give away, and which soon had the wealth of Europe to distribute among its creatures. The minister of the police, on whom the institutions of the time conferred such attributions, though placed under the supreme and vigilant authority of the first consul, yet possessed a formidable power over the whole nation.

“M. Fouché, charged to exercise this power, formerly an oratorian and a conventionalist, was an intelligent and a crafty personage, neither good nor wicked, well acquainted with men, especially the bad, and despising them; employing the funds of the police in supporting the agents of troubles as much as in watching them; always ready to procure bread or a place for every person weary of political agitations; thus making friends for the government, and more especially for himself; creating for himself obliged dependents, far superior to credulous and deceitful spies, who never:

failed to inform him of everything that it was his interest to know; having persons under obligations to him in all the parties, even among the royalists, whom he knew how to manage, and to repress at the right time; always forewarned, never overrating danger, nor exaggerating it to his master; clearly distinguishing an imprudent man from one really to be feared, knowing when to caution the one, to proceed against the other; in short, managing the police better than it ever was managed, for it consists in disarming animosities as much as in repressing them; a superior minister, if he had had elevated intentions, if his indulgence had sprung from any other principle than an indifference to good and evil, if his activity had proceeded from any other motive than a passion for interfering in everything, which rendered him irksome and suspicious to the first consul, and frequently gave him the appearance of a vulgar intriguer. For the rest, his intelligent but ignoble countenance, was a faithful mirror of the qualities and vices of his soul.

"The first consul, chary of his confidence, never granted it freely, especially to men for whom he had no esteem. He made use of M. Fouché, and at the same time distrusted him. Hence he sometimes sought to dispense with or to control him, by giving money to De Bourrienne, his secretary, to Murat, the commandant of Paris, but especially to Savary, his aid-de-camp, in order to compose in this way several contradictory policies. But M. Fouché always contrived to convict these bastard policies of awkwardness and puerility, proved himself alone to be well informed; and, while frequently crossing the first consul, nevertheless made his peace with him by that manner of treating men in which was mingled neither love nor hate, but an incessant application to wean them, one by one, from an agitated and factious existence."

Here is the companion to this historical portrait.

"M. De Talleyrand performed a totally contrary part; he had neither affection for M. Fouché nor resemblance to him. They had both been formerly priests, the one having belonged to the superior, the other to the inferior clergy; and yet they had nothing in common, but their having both taken advantage of the Revolution to cast aside, the former the prelate's robes, the latter the humble gown of the oratorian professor. How strange, it must be confessed, and how characteristic of that deeply convulsed society, was the spectacle presented by this government, composed of a soldier and two priests who had abjured their profession, and, though thus composed, having none the less splendor, grandeur, and influence in the world.

"M. de Talleyrand, descended from a family of the noblest lineage, destined by his birth for the army, doomed to the priesthood by an accident which deprived him of the use of one foot, having no liking for this imposed profession, successively bishop, courtier, revolutionist, and emigrant, then afterwards minister for foreign affairs under the Directory, M. de Talleyrand had retained something of all these different states. There was to be found in him a touch of the bishop, of the man of quality, and of the revolutionist. Having no firmly fixed opinion, but only a natural moderation, which was opposed to every species of exaggeration; capable of entering at once into the feelings of those whom he wished to please, either from liking or from interest; speaking a unique

language peculiar to that society which had Voltaire for instructor; full of smart, poignant repartees, which rendered him as formidable as he was attractive; by turns caressing or disdainful, demonstrative or impenetrable; careless, dignified, lame without loss of gracefulness; in short, one of the most extraordinary personages, and such a one as a revolution alone can produce, he was the most seducing of negotiators, but at the same time incapable of directing, as head, the affairs of a great state; for every leader should possess a resolute will, settled views, and application; and he had none of these. His will was confined to pleasing, his views consisted in the opinions of the moment, his application was next to nothing. In a word, he was an accomplished ambassador, but not a directing minister: he it understood, however, that this expression is to be taken in its most elevated acceptation. For the rest, he held no other post under the consular government. The first consul, who allowed no person the right to give an opinion on the affairs of war and of diplomacy, merely employed him to negotiate with the foreign ministers, on bases previously prescribed; and this M. de Talleyrand did with art that will never be surpassed. He possessed, however, a moral merit; that of being fond of peace under a master who was fond of war, and of showing that he was so. Endowed with exquisite taste, uniting with it unerring tact, and even a useful indolence, he was able to render real services, by simply opposing to the first consul's exuberance of language, pen, and action, his sobriety, his perfect moderation, and his very propensity to do nothing. But he made little impression on that imperious master, from whom he extorted no respect either by genius or by conviction. Thus he had no more empire than M. Fouché, nay, even less, though quite as much employed, and more agreeable."

Using those two men while he placed no faith in them, and treating the third consul, Lebrun, as being what he was—a useful and plodding superintendent of administrative details—Bonaparte bestowed all his real confidence on the second consul, his faithful and cautious friend, Cambacérés. This prudent person counselled his master privately with faithfulness and courage: publicly he approved of everything the first consul did. Exercising in reality, immense power over Bonaparte's mind, he was content to appear absolutely powerless. He was content to eat and drink like an Apicius, to wear splendid clothes, to receive the homage of a few insignificant toad-eaters, and to be believed and called, by those who thought themselves shrewd observers, a tool, a cipher, a nonentity: and all this, too, while he quietly corrected or prevented blunders of his patron, managed to keep the senate in due subservience, and silently promoted, with all his might, those ambitious designs, of which he perhaps was more fully in the secret than any other man living.

"The consul Cambacérés was qualified more especially to temper his vehemence in regard to persons, and his precipitation in regard to things. Amidst this conflict of two opposite tendencies, one urging to a precipitate reaction, the other, on the contrary, combating that reaction, M. Cambacérés, inflexible when the maintenance of order was in question, was, in everything else, always a decided advocate for not going too fast. He did not oppose the end to which things were visibly tending; for he kept incessantly repeating, 'Let them in due time decree as much power as they

please to the first consul, well, and good, but not too soon.' He wished especially that reality should always be preferred to appearance, real power to that which was but ostentation. A first consul, possessing the power to do all that he pleased for the welfare of the state, seemed to him far superior to a crowned prince, cramped in his action. To act, and too keep out of sight, above all, never to act too quickly, constituted the whole of his wisdom. This most certainly is not genius, but it is prudence; and for founding a great state, both are requisite."

Besides Cambacérés, however, there were other persons, who were supposed to possess much of the first consul's confidence, and to be authorized organs for communicating his wishes. These were his brothers, of whom, however, Joseph and Lucien alone were at that time engaged in public life, and Lucien much more efficiently and zealously than Joseph. These persons were accustomed openly to represent the existing state of things as merely temporary, as a prudent concession to revolutionary prejudices, and as necessarily destined to give way to something which should make the system independent of the life or death of the first consul himself. What they meant was sufficiently plain, even if they had not also complained of the consul's want of children, and maintained without reserve that he must divorce his wife and take a new one for the sake of issue. The introduction of this topic is, for us as well as for M. Thiers, a temptation to digress. The ominous warnings thus thrown out were the causes of much misery to a light-minded, but attractive person, whose history and character are thus depicted for us.

"Josephine Bonaparte, who had been married first to the Count de Beauharnais, then to the young general who had saved the convention on the 13th Vendémiaire, and now shared with him a place which began to resemble a throne, was a Creole by birth, and had all the graces, all the defects, usual in women who are so born. Kind-hearted, profuse, and frivolous—not a beauty, but perfectly elegant, and endowed with infinite fascination, she could please much more than women who were superior to her in understanding and personal charms. The levity of her conduct, depicted to her husband in the most unfavorable colors when he returned from Egypt, filled him with anger. He had thoughts of separating himself from a wife whom, right or wrong, he believed to be culpable. She wept a long time at his feet; her two children, Hortense and Eugène Beauharnais, both very dear to General Bonaparte, wept too; he was overcome, and yielded to a conjugal tenderness, which, for many years, was with him paramount to policy. He forgot the real or alleged faults of Josephine; he loved her still, but not as in the early period of their union. The unbounded extravagance, the vexatious imprudences, in which she daily indulged, frequently excited in her husband gusts of impatience which he could not repress; but he forgave her with the kindness which prosperity inspires, and could not long be angry with a woman, who had shared the first moments of his nascent greatness, and who, from the day of their union, seemed to have brought fortune along with her.

"Madame Bonaparte was altogether a woman of the *ancien régime*, devout, superstitious, nay, a royalist, detesting what she called the Jacobins, who hated her in return; seeking only the society

of the ancient nobility, who, returning in throngs, as we have said, used to visit her in the morning. They had known her the wife of an honorable man, pretty high in rank and in military standing, the unfortunate Beauharnais, who died on the revolutionary scaffold; they found her the wife of a *parvenu*, but of a *parvenu* more powerful than any prince in Europe; they did not hesitate to go and solicit favors, while affecting to look down upon her. She was eager to make them partakers of her power, and to render them services. She even took pains to excite in them a sort of illusion which they were fond of indulging, that, in reality, General Bonaparte was only waiting for a favorable occasion to recall the Bourbons, and to restore the inheritance which belonged to them. And, singularly enough, this illusion which she delighted to instil into them, she would almost fain have shared herself; for she would rather have seen her husband a subject of the Bourbons, but a subject the protector of his kings, surrounded by the homage of the ancient French aristocracy, than crowned monarch by the hand of the nation. She was a very faint-hearted woman. Though giddy, she loved that man who covered her with glory, and loved him the more since she was less beloved by him. Not conceiving it possible that he could set his daring foot on the steps of the throne, without falling immediately beneath the dagger of republicans or royalists, she foresaw her children, her husband, and herself, overwhelmed in one general ruin. But, supposing that he ascended safe and sound to that usurped throne, another fear harrowed her heart—it would not be her lot to share his elevation. If General Bonaparte should some day be made king or emperor, it would evidently be under the pretext of giving a stable government to France, by rendering it hereditary; and unfortunately her physicians left her no hope of ever having more children. She recollected on this subject the extraordinary prediction of a woman, a sort of Pythoness then in vogue, who had told her: 'You will occupy the first place in the world, but only for a short time.' She had already heard the brothers of the first consul pronounce the fatal word, divorce. The victim of grandeur, whom, to judge of her lot from the external splendor by which she was surrounded, the queens of Europe might have envied, was a prey to corroding care. Each advance of fortune added apparently to her happiness, but really augmented her distress; and if she did escape from her keen anxieties, it was by a levity of character which saved her long and intense thought. The attachment of General Bonaparte for her, his gusts of passion, when he gave way to them, repaired the next moment by demonstrations of the greatest kindness, served also to cheer her. Hurried away, moreover, like all the people of that time, by a stupefying whirlwind, she reckoned upon the god of revolutions, upon chance; and, after painful agitations, she returned to the enjoyment of her fortune. She strove, meanwhile, to divert her husband from his ideas of an exaggerated greatness; ventured even to talk to him of the Bourbons, at the risk of raising storms; and, in spite of her partialities, which ought to have led her to prefer M. de Talleyrand to M. Fouché, she had taken a liking to the latter, because, thorough Jacobin as he was, she said, he dared tell the truth to the first consul; and to tell the truth to the first consul was, in her estimation, to advise him to uphold the republic,

but to increase at the same time his consular power."

Returning to the narrative from which we have thus been led astray, we come to an experiment which was the result of the combined influences operating on the mind of Napoleon. To that experiment it cannot be doubted but he was a party, if indeed it did not emanate directly from himself. It was one of those mistakes which he so often committed through overweening confidence in his own strength, and which no man could redeem with greater readiness and dexterity. In October, 1800, there appeared a pamphlet, entitled "A Parallel between Cæsar, Cromwell, Monk, and Bonaparte." The question was, in which of the three preceding instances the parallel for the first consul was to be found. It could not be found in Monk: the restoration of the Bourbons was an act too absurd to be thought of. It was not to be found in Cromwell; whom the pamphleteer, by the way, treated very unjustly, and who, it was asserted, was represented more fitly by Robespierre. The protector's real disqualification for representing Bonaparte was, his not having made himself a king in name as well as in reality. The parallel sought was found in Julius Cæsar, and was declared to be perfect in all respects but one; that Cæsar had oppressed the honest men and elevated dangerous men and knaves, while Napoleon had annihilated the wicked factions, and raised the honest citizens to safety and honor. The republic was pronounced to be happy, if Bonaparte were immortal; and a frightful picture was drawn of the mischiefs that must fall upon France, if the first consul were to die while things remained on their present footing. "Frenchmen," these were the last words of the address, "you are sleeping on the brink of an abyss!" This pamphlet was currently attributed to Lucien Bonaparte, but is pronounced by M. Thiers to have been composed by M. de Fontanes, who had already been selected by the first consul as the writer of harangues to be pronounced upon public occasions.

"All that it contained, excepting the flatteries of language, was true; but those truths were very premature, to judge from the impression which they produced. Lucien, minister of the interior, employed the means at his disposal for circulating this pamphlet over all France. He filled Paris and the provinces with it, taking care to conceal its origin. The publication produced a great effect. In reality, it said only what everybody thought; but it required of France an avowal which a very legitimate pride did not yet permit her to make. Eight years before, the French had abolished a royalty of fourteen centuries; and were they to come so soon and confess, at the feet of a general of thirty, that they were wrong, and beseech him to revive that royalty in his person! They were willing enough to invest him with a power equal to that of kings; but it was necessary at least to save appearances, were it merely for the sake of the national dignity. True, this young warrior had already gained admirable victories, and already restored, to some extent, security throughout the country; but he had scarcely commenced the reconciliation of parties, the reorganization of France, the compilation of its laws, and above all, he had not yet given peace to the world. There were then many titles yet left for him to acquire, but which he was sure of soon concentrating on his glorious head.

"The impression was general and painful. The

prefects reported from all quarters that the pamphlet produced a mischievous effect; that it supplied the demagogue faction with some justification; that Cæsars called forth Brutuses; that the publication was imprudent, and to be regretted. In Paris the impression was the same. In the council of state the disapprobation was not concealed. The first consul, whether he had been concerned in the pamphlet, or whether he had been compromised without his knowledge by impatient and unskilful friends, deemed it incumbent on him to disavow it, especially in the eyes of the revolutionary party. He sent for M. Fouché, and asked him publicly how he could suffer such publications to be circulated. 'I know the author,' replied the minister.—'If you know him, you ought to have sent him to Vincennes.' 'I could not send him to Vincennes,' rejoined M. Fouché, 'for it is your own brother.' At these words General Bonaparte complained bitterly of that brother, who had already compromised him oftener than once. A feeling of displeasure with Lucien Bonaparte was the consequence. One day, the latter not being punctual at the council of the ministers, which was frequently the case, and many complaints being preferred against his administration, the first consul expressed strong dissatisfaction, and seemed disposed to dismiss him immediately. But Cambacérés advised him not to proceed so harshly, and not to take the portfolio of the interior from Lucien, without giving him a suitable compensation. The first consul complied. M. Cambacérés contrived the embassy to Spain, and was directed to offer it to Lucien. He had no difficulty in persuading him to accept it. Lucien set off; and before long the imprudent pamphlet ceased to be thought of.

"Thus, a first attempt at assassination against the first consul had provoked in his favor a first attempt at elevation: but the one was as mad as the other was awkward. It was requisite that General Bonaparte should purchase by fresh services an augmentation of authority, which nobody yet defined with precision, but which all foresaw confusedly in the future, and to which he or his friends already aspired in an open manner. At all events, his fortune was soon to furnish him, in services rendered, in dangers encountered, with immense claims, which France would no longer resist."

The attempt at assassination alluded to in this extract had taken place shortly before the publication of the pamphlet. It arose among the republicans, and, as M. Thiers has truly said, was more ridiculous than criminal. It deserves notice mainly that a cordial acquiescence may be expressed in the sentence of condemnation, which the historian pronounces upon the conduct of the government in regard to it. The government actually nursed and encouraged the plot, through the agency of police spies, in order that it might proceed so far as to give them a pretence for exaggerating the first consul's danger. Nay, they went a step farther: for, on the next occurrence of the same sort—the plot of the Infernal Machine, on which our space will not allow us to enter—Bonaparte, led away by his hatred and distrust of the republicans, and little influenced at any time by pure feelings of justice, actually punished with death the chief of those persons whom his own servants had tempted into the planning of a crime, and who had really after all never had the courage to attempt executing the evil design that had been

in contemplation. It is unnecessary to remind our readers that our own domestic history—in a section of it with which the publisher of this Magazine had occasion to be personally connected—has furnished a parallel to the unprincipled act thus perpetrated by the French consular government.

In passing rapidly through the two volumes now before us, we have bestowed attention chiefly on those incidents and principles which paved for Napoleon the way to the imperial throne. We have been compelled to leave untouched many topics which, to some readers of the work, may appear even more important and instructive. And thus, in our rapid survey of the second volume, the limits of our space compel us to pause without entering at all upon two themes which possessed great public importance. The one embraces the history of that campaign in Southern Germany, which was distinguished by Moreau's great victory at Hohenlinden, and which led to the renewal of the negotiations with Austria and to the peace of Luneville. The other topic is treated in the last book of the volume, in which M. Thiers is chiefly occupied with describing, not exactly as we should like, yet with no substantial inaccuracy, the policy pursued by England in regard to the maritime rights of the neutral powers. In this part of the narrative the principal event is Nelson's bombardment of Copenhagen.

The volume closes in April, 1801, when Mr. Addington had succeeded Mr. Pitt as premier of England, and when the negotiations for a general peace were about to be opened. We shall receive with good will, and study with care, the portions which shall next be presented of the elaborate historical work so well begun. We do not doubt that, when it shall have been completed, it will be fully worthy of occupying a place beside the author's brilliant "History of the French Revolution."

From the Critic.

A Treatise on Corns, Bunions, the Diseases of the Nails, and the General Management of the Feet.
By LEWIS DURLACHER, Surgeon Chiropodist to the Queen. London, Simpkin & Co. 1845.

How few are exempt from the plague of corns; yet how few have the slightest knowledge of their physiology. Aided by Mr. Durlacher's useful treatise, we proceed to convey to our readers some information upon a subject that interests everybody, and of which nobody seems to know anything.

The skin is an extended tissue, composed of tendinous fibres, felt together like the texture of a hat. It is densely supplied with pores. "The cuticle, or outside skin, is composed of round scales, so minute," says Leuwenhoek, "that one grain of sand would cover from 200 to 250." He considers that the perspiration does not penetrate the scales, but oozes between them. These scales are not permanent, but come away in clusters.

The friction and pressure to which all prominent parts of the extremities are exposed, cause, by the local irritation they produce, the effusion or secretion of a larger quantity of epidermis than can be got rid of by the ordinary processes of nature. The scales consequently accumulate, and lie layer upon layer, forming indurated masses

of larger or smaller size, constituting corns, callosities, or other diseases of the part, according to their situation, and the severity of the pressure or friction.

The predisposing causes of corns are *pressure* and *friction*, and this is

THE NATURAL HISTORY OF CORNS.

"Improperly made shoes invariably produce pressure upon the integuments of the toes and prominent parts of the feet, to which is opposed a corresponding resistance from the bone immediately beneath; in consequence of which, the vessels of the dermis are compressed between them, become injured, congested, and, after a time, hypertrophied; a larger quantity of lymph is thrown out than is required for the formation of the normal cuticle, so that layers are generated considerably sooner than the outer lamina is worn off, thus forming layer upon layer, which become interwoven, and adhere together.

"If the cause be removed, the inflammatory action ceases, and the result is simply an external induration of superficial irregular scales or laminae; if continued, the irritation keeps up the increased action of the papillae, more epidermic secretion is poured out upon the under surface of the already thickened cuticle, where it coagulates, producing bulbs or projections, generally of conical shape, descending into corresponding cells or follicles of irregular depths, according to the injury caused upon the immediate parts, where the external pressure is most severe. In this manner the process continues to the full development; the surrounding congestion ceases, lymph is thrown out, which becomes organized, and forms a protective sheath or sac round each bulb to its apex, and thus the formation of the corn is completed.

"These bulbs are composed of layers, decreasing more and more in size as they approach the secreting point in the dermis, where they become condensed and opaque by compression, visible as white or yellowish specks, according to the coloring matter of the skin, when the outer portion of the induration has been removed.

"These irregularities, or projections, are what have been incorrectly called stems, or roots."

Corns produced by friction alone, are generally superficial, and seldom painful.

After dealing skilfully with malformation of the toe-nails, bunions, and other diseases of the foot, Mr. Durlacher proceeds to the hands, and his tenth chapter is devoted to

THE MANAGEMENT OF THE FINGER-NAILS.

"According to European fashion, they should be of an oval figure, transparent, without specks or ridges of any kind; the semi-lunar fold, or white half-circle, should be fully developed, and the pellicle, or cuticle which forms the configuration around the root of the nail, thin and well defined, and, when properly arranged, should represent, as nearly as possible, the shape of a half-filbert.

"The proper arrangement of the nails is to cut them of an oval shape, corresponding with the form of the fingers; they should not be allowed to grow too long, as it is difficult to keep them clean; nor too short, as it allows the end of the fingers to become flattened and enlarged, by being pressed upwards against the nails, and gives them a clumsy appearance. The epidermis which forms the semicircle around, and adheres to the nail,

requires particular attention, as it is frequently dragged on with its growth, drawing the skin below the nail so tense, as to cause it to crack and separate into what are called ag-nails. This is easily remedied by carefully separating the skin from the nail by a blunt, half-round instrument. Many persons are in the habit of continually cutting this pellicle, in consequence of which it becomes exceedingly irregular, and often injurious to the growth of the nail. They also frequently pick under the nails with a pin, pen-knife, or the point of sharp scissors, with the intention of keeping them clean, by doing which they often loosen them and occasion considerable injury.

"The nails should be cleansed with a brush not too hard, and the semicircular skin should not be cut away, but only loosened, without touching the quick, the fingers being afterwards dipped in tepid water, and the skin pushed back with a towel. This method, which should be practised daily, will keep the nails of a proper shape, prevent ag-nails, and the pellicle from thickening or becoming ragged.

"When the nails are naturally rugged, or ill-formed, the longitudinal ridges or fibres should be slightly scraped and rubbed with lemon, afterwards rinsed in water, and well dried with the towel; but if the nails are very thin, no benefit will be derived by scraping; on the contrary, it might cause them to split. If the nails grow more to one side than the other, they should be cut in such a manner as to make the point come as near as possible in the centre of the end of the finger."

Warts are sometimes troublesome companions, and always unsightly. They are hard, indolent tumors, or tubercles, differing in structure from corns, as they arise from the true skin, and are composed of an elongated bundle of its papillæ, inclosed in sheaths of cuticle; whereas corns are a disorder of the epidermis alone.

The reader is aware of the many superstitious cures for warts. "Etmuller seriously mentions as a remedy the green moss gathered from the skulls of persons who have died a violent death; this is to be exposed to the air, and made into a paste; and Juncker states that a thread drawn from the shirt of a dying criminal from near the armpit, is equally valuable. As many knots are to be tied in the thread as there are warts to be destroyed, and each knot is to be rubbed on the corresponding wart, after which the thread is directed to be buried in a moist place. As the knots rot away, so says Juncker, will the warts consume and disappear. He adds, he has never known it to fail." But quitting these amusing absurdities, let us see what our author prescribes for

CURE OF WARTS.

"The general methodic treatment consists in the application of caustic alkalies, acids, and escharotics, or else their removal by the ligature or the knife.

"The pendulous or sessile wart, which is connected with the integuments by a small foot-stalk, is readily removable by the application of a liga-

ture of horse-hair or waxed silk thrown around and drawn tight, and secured with a surgeon's knot. When deprived of the access of blood, by which its vitality is sustained, the wart will gradually shrivel up and separate. If there should afterwards appear any remains of a root, it must be touched with nitrate of silver until destroyed, for if any portion remain, the wart is certain to be reproduced.

"The caustic alkalies may be frequently applied for the removal of the round and flat warts, but they will not always be successful. The best treatment is to cut the wart as close as possible without giving pain, and, while yet bleeding, freely to rub the lunar caustic on it. This operation is to be repeated, until the whole is entirely destroyed. In some cases nitric acid may be used instead of the nitrate of silver, but great care is requisite in using either of these escharotics, when the wart is seated near or upon a joint, where the skin is thin, as considerable mischief may follow their indiscriminate application."

A concluding chapter on the management of the feet abounds in useful suggestions. Mr. Durlacher recommends that care be taken to have the stockings of proper length; he thinks if they could be made like gloves, with a separate place for each toe, corns might be entirely prevented. Shoes should always be a size larger than the foot. The feet should be washed every day. Here are some

HINTS TO SPORTSMEN.

"Sportsmen, during the shooting season, ought to wear woollen stockings, and change them daily; the shoes should be made right and left, and to fit firmly over the instep and round the ankle, so as to prevent the foot from slipping about in them; the soles ought to be considerably thicker than are usually made, with a full tread, and the waist narrow: the outside should not be too much twisted, but he made straight until above the little toe, and then shaped to the foot; the upper leather should be very pliable and soft, lined throughout (instead of the usual narrow pieces pressing on the toes) and properly fitted, so as not to have any ridges or uneven surface. If the shoes can be depended on as waterproof, it would be preferable.

"The foot of the stocking, as far up as the ankle, should be well rubbed over with common yellow soap, to prevent the feet from being chafed or galled. Stockings thus prepared ought to be worn constantly during the season. Half-a-dozen pairs may be prepared at once, so as to have them always in readiness. When the stockings are changed in the evening, of course the clean ones should be worn without soap.

"After the day's fatigue, the feet should be kept for ten or fifteen minutes in hot water, in which two large handfuls of salt have been previously dissolved, then wiped thoroughly dry, and well rubbed with Eau de Cologne, brandy, or other spirit."

We now close Mr. Durlacher's volume, which we can commend to all who have a painful interest in any of the topics it treats so sensibly.
